NEW PUBLICATIONS.

Day's Collacon. An Encyclopædia of Prose Quotations, consisting of Beautiful Thoughts, Choice Extracts, and Sayings of the most eminent writers of all nations, from the earliest ages to the present time, together with a comprehensive biographical dictionary of Authors, 40,000 quotations, 8,000 authors, 2,000 topics, 125 beautiful portraits in steel and wood. Day's Collacon is an encyclopædia of prose quotations, and one of the amplest dimensions. The number of authors whose works are quoted in the collection is said to be eight thousand, comprising the chief names in ancient and modern literature. The quotations are ranged under two thousand classified headings, and amount to some forty thousand. As to the quality of these grains of wisdom there is probably not one which has not a profound value for some order of mind and some mood of feeling; at the same time, it must be acknowledged, there are whole pages that certain fastidious students and advanced spirits will pass over as commonplace. This is inevitable from the vast plan of the work and the limitless progression of intellectual development. The compiler has manifestly not undertaken to suit the needs of any particular person or class, but he has made an immense gathering of waifs from the ocean of literature, and he invites every one to come and take what he fancies or needs. The materials are indexed so as to make reference easy and direct. The author's names, with biographical notes, are given in the appendix, making in themselves a quite convenient dictionary of literary biography. An attractive feature of the volume is the series of portraits which are scattered through it, numbering, large and small, a hundred and twenty-five. The price of this work has been placed at $12.00. A copy is in our office, and we will take orders for the same.

Cottages. A new work that recommends itself on account of the number and variety of plans presented. Price, $1.00.

Buck's Designs. For its size, one of the best books that has been presented to the public. Price, 50 cents.

Album of Mantles $8 00
How to Build, Furnish, and Decorate 5 00
Building Superintendence 3 00
Eastlake's Hints on Household Tastes 3 00
Manual for Furniture Men 1 00
Shavings and Sawdust 1 50
History of Architecture 15 00

The above are all new works, and will be forwarded to any address upon receipt of the amount.

Every property owner should subscribe for the "CALIFORNIA ARCHITECT AND BUILDING NEWS." It is the only Journal on the Pacific Coast published strictly to advance your interests. Only $2.00 per annum.

THE PAINTER'S FOREMAN.
A BOOK OF VALUABLE RECEIPTS.

It explains how to grain or imitate French Walnut that cannot be discounted; also Black Walnut, Oak, Ash, Chestnut Cherry, Satinwood, Bird's Eye, and Curly Maple, and the different woods that are imitated by graining. It gives you a sample color of the different kinds of background used to imitate the different kinds of wood, how to mix and what colors to use to make them, and how to apply them from the first coat to the last.

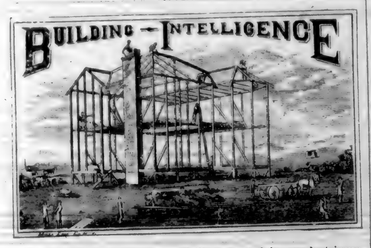
The graining department is explained so clearly and fully that by following the directions any one can do a first-class job of graining. It also explains how to do different kinds of Fresco work, what colors to use, how to mix and apply them. How to grain or imitate the different marbles, what colors to use, how to mix and apply them. How to make the different kinds of wood fillers, the different kinds of oil finish, the different kinds of polishes. How to gild letters on wood. How to make and use smalt. How to paint banners, etc. How to gild on japan, tin signs. How to make changeable signs that will read three different ways on same board. How to letter glass signs. How to do pearl work. How to gild on glass. How to color glass. How to ebonize wood. How to make paint for school blackboards, etc., etc., etc.

In fact, it is the only work published that explains fully and clearly the different secrets of the painting art.

Price, by mail, post-paid $2.00.

Address. F. C. SHEPARD,
Crawford Co., Box 11. EVANSBURGH, PA.

BUILDING INTELLIGENCE



The building on Clay near Polk, reported in our last issue A. Curlett & Haskell, should have been A.—Curlett & Cuthbertson; C.—Leonard & Haskell. The building on Nineteenth near Mission, reported A.—T. J. Welsh, should have been A.—M. J. Welsh.

SAN FRANCISCO.

Market, cor. Jones. Five-story and basement brick.
O.—Murphy, Grant & Co.
A.—Kenitzer & Raun.
C.—Mahoney Bros., carpenters.
R. Mitchell, mason.

Review of Building Operations.

THIRD QUARTER.

DURING the past quarter there has been a general complaint amongst real estate dealers of a stagnation in business. While the records will prove this statement, the same state of affairs, very happily, does not exist in the building trades. The past quarter has been a very active one, and the number and value of buildings exceed those of any previous record for the same length of time.

The report for the month, published on the last page of reading matter in this issue, is well worth study. Leaving out the Pioneers' Building, we find there have been commenced over 100 improvements, of the value of about half a million dollars an average of $5,000 each.

Another feature of special mention should be noticed. *A larger percentage of buildings in the course of construction are under the* SUPERVISION OF PROFESSIONAL ARCHITECTS, *Than in any list we have published for some time.* From this we deduce that owners have become tired of the "shoddy" work they get from adopting *carpenters'* plans, which are tendered them free of charge, if the one presenting the plan has the honor of erecting the building. The custom of giving plans for nothing is one that should be frowned down by every intelligent owner of real estate, as they are sure to suffer in the end from badly designed and imperfectly constructed buildings.

For the sake of comparison, we present the record for the first nine months of the past three years:—

FIRST NINE MONTHS OF 1882.

582 Buildings, of the value of.....$2,655,726

SAME TIME IN 1883.

635 Buildings, of the value of.....$4,579,878

SAME TIME IN 1884.

796 Buildings, of the value of.....$5,160,334

This summary proves that the city has had an actual and steady growth for the past three years. Although since January, 1882, there have been reported in this Journal 2,382 new buildings and improvements, there are comparatively very few buildings to rent; and most of the latter are the old-fashioned basement houses, in which the dining-room and kitchen are on the lower floor, thus compelling the roomers on the top floor to travel up and down two flights of stairs at meal-time and as occasion requires. Since the introduction of elevators, the mass of the people have grown tired of running up and down stairs, and this is one of the principal reasons why "*flats*" rent so readily, as all the conveniences are found on one floor.

NOW IS THE TIME TO BUILD.

During the past month there has been a total collapse of the lumber market. Prices have fallen from fifteen to twenty-five per cent. Eighteen dollars per M. is the ruling price, and in large lots a discount is obtainable from that figure. The principal cause for the break is the absence of a foreign demand In the February issue of this journal, we gave a full history of the "Lumber Bone Yard." We showed that the lumber combination was in a large measure supported by the foreign demand. If a cargo from the mills arrived in the city for which there was but little demand, it was sent to the "Bone Yard" to be reshipped to foreign ports at any obtainable price, as occasion demanded. When orders for foreign ports were brisk, all was well, but when these ceased, it became too heavy a burden for the combination to carry.

Over fourteen million feet of lumber are now piled up in the "Yard." This must be got rid of before the time comes next year for another lumber squeeze on the dear public. Many of the mills have shut down, and others are working on three-quarter time.

Hardware is also very cheap, nails selling as low as $2.80 per keg. Other things are in proportion. From a careful study of the field, we would advise those who can, to lay in a stock of lumber and nails. It is the design of the manufacturers to curtail stock on hand as much as possible, and as they are diminished by future demands, prices will correspondingly stiffen, and in a few months will resume the old standard.

San Francisco Chapter American Institute of Architects.

THE regular monthly meeting was held on September 5th at the usual place. It being also the annual meeting, a fair representation of the architects of the city were present.

Propositions for membership as Fellows were received from H. Geilfuss and R. H. Daley. Secretary's report was received, and ~~after a short debate was ordered spread in full~~ upon the minutes.

[*An article will be found in another column upon the Secretary's report. It was objected to on the ground that it contained the Treasurer's report, as well as the Secretary's. The Chapter by a UNANIMOUS vote, adopted the report as read.*—ED.]

The committee appointed to consider the feasibility of amendments to the Fire Ordinances of San Francisco, reported as follows:—

SAN FRANCISCO, Sept. 5, 1884.

TO THE OFFICERS AND MEMBERS OF THE SAN FRANCISCO CHAPTER OF ARCHITECTS—*Brother Fellows and Members:* Your committee appointed at the August Session of the Chapter to consider and prepare revisionary recommendations and amendments to the Fire Ordinances of the city and county of San Francisco, beg leave to report progress only as we find the task somewhat complicated and difficult, owing to the distribution of the subject matter in interest through various sections of the Book of Ordinances as printed, which can only be intelligently reached and analyzed by careful review and application.

It is not proposed to touch any of the ordinances relating otherwise than to building and other mechanical constructions usually within the scope of architectural limits. Your committee has taken the necessary measures to procure copies of the Fire Ordinances of Eastern cities, and will report the result of their deliberations to the Chapter as soon as possible for us to obtain the desired information, and perfect such report in the fullness demanded by the importance of the subject matter under consideration. Respectfully submitted

JAMES E. WOLFE,
B. E. HENRIKSEN,
THOS. J. WELSH,
WM. CURLETT,
JOHN M. CURTIS,
} *Committee.*

Further time was granted to the committee. Election of officers for the ensuing term being in order, the following gentlemen were chosen to serve:—

PRESIDENT, Augustus Laver.
VICE-PRESIDENT, Albert Pissis.
SECRETARY, B. E. Henriksen.
TREASURER, J. M. Curtis.
TRUSTEES: J. E. Wolfe, W. Curlett, H. G. Matthews, G. H. Sanders, T. J. Welsh.

A vote of thanks was tendered the retiring officers.

The teachers of the various classes reported that the students had made creditable progress. G. H. Sanders gave notice that he would be prepared at the next meeting with a paper to read.

The Architects' Meeting and the Daily Papers' Reports.

IT frequently occurs that the proceedings of the Chapter of Architects are not reported correctly in the daily papers. The *Chronicle*, in noticing the proceedings of the annual session, held the 5th instant, saw fit to head its item with the insinuative slur, "Inharmonious Architects," which was not and is not true. The proceedings were entirely harmonious throughout, provided *free and gentlemanly discussion* upon matters of importance is to be considered not a violation of the rules of harmony. The objection made by the retiring Treasurer to the Secretary's annual report was simply and wholly upon the grounds that the Secretary had received and disbursed the receipts from dues and other sources, for room rent, stationery, printing, seal, and other current expenses, as had been the custom between all preceding Treasurers and the Secretary, since the first formation of the Pacific Coast Association of architects about four years ago, without the formality of paying the moneys received to the Treasurer and drawing warrants, as provided by the by-laws. This led to a discussion, which was more or less joined in by the members present, and was concluded by the unanimous acceptance of the Secretary's report, and its being ordered spread in full upon the minutes.

Mr. Macy, the retiring Treasurer, actuated by the best of motives, and with the simple desire to have the affairs of the Chapter conducted *technically* as well as *executively* correct, raised the objection upon the grounds that it contained a full report of all moneys received and disbursed, vouchers for expenditures, and balance on hand—he claiming that all this should have passed through his hands.

The *Examiner* stated, in its report, that the Committee on Fire Ordinances made no report—fact, said Committee made their report, occupying a full page of legal cap, signed by all the members of the Committee, which will be found in full on page 156 of this issue.

How to Lay Drain Pipe.

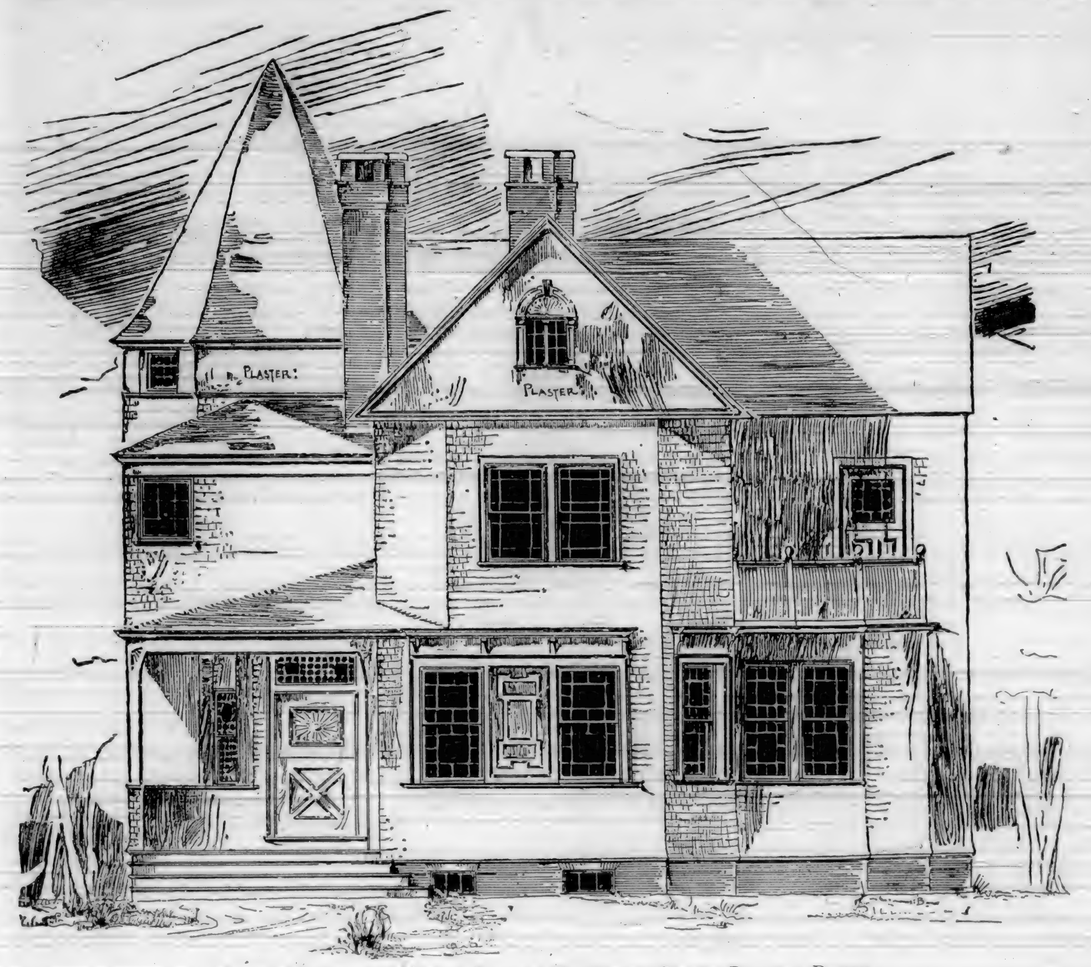
PIPE laying of a peculiar sort is supposed to be in order about Convention time, but the methods in use for laying drain pipe must be at all times a subject of interest to the plumber. The Lowell *Times* in a recent communication from a Mr. Stables, presents that gentleman's methods in the following manner: "As a rule this kind of work (laying drain pipe) is intrusted to the very poorest of mechanics, if indeed they are mechanics at all, and that, too, without the supervision of a person in the least familiar with the requirements of the business. The drain is sometimes put in before the cellar is built, and very often before the sills are put on, whereas it should be one of the last things on the job, and should be put in in connection with the plumbing, not by the plumber necessarily, but at the same time that his work is being done. My reasons for delaying this are that all open inlets are liable to get filled up with dust and chips that are always strewn about a new building, which in future may become the innocent means of trouble, and that changes are liable to be made which will necessitate a different arrangement of the drain, and also that it is impossible to test a drain under pressure till the plumbing is securely connected. Speaking of testing drains, in my opinion every drain should be tested under a pressure of at least five feet head of water. The method which I employ to accomplish this is to dig the trench twenty inches or two feet wide, so that the pipe layer can have room enough to properly do his work. I then start the drain at a regular grade with an inclination adapted to the lay of the land, and at a convenient point near the outlet I put a brass slide-gate by which the drain can be closed perfectly tight in the same way that the water is shut off in our water mains. I then lay the pipe with Portland cement, using care to clean all joints and the inside, and to carefully fill the socket around the full circle, rubbing it down hard with a small trowel when it begins to set. I follow on in this way throughout the whole system, taking in conductors, soil-pipes, fresh air inlet and whatever other connections are called for, and when completed, leaving the entire trench open, I allow it to stand for two or three days for the cementing to get hard. I then close the gate and fill the entire system up to the lowest inlet, and if I find any leaks, I open the gate, let the water out, and re-cement the leaky joints. I then close the gate, repeat the first operation, and if tight, I open the gate and fill the trench, and call the job finished. In cases where people do not wish to go to the expense of a gate, I have taken a T-branch and bedded a piece of double thick glass, cut to fit in the socket, into the socket of the main pipe, in putty, and then laid the system in the same manner as described. I then fill the drain with water, and when satisfied it is tight, I reach into the T and break the glass with a hammer, and clean out the pieces after the water has gone; but this can never be used a second time for flushing the drain. Leaving out all sanitary considerations, this test will pay the property owner through the more mechanical advantage gained. It will retain the liquids which are required to float away the solids. If the liquids leak out at every joint the solids will accumulate, and finally stop the drain. Leaky drains will sometimes become stopped, but the stoppage will not be discovered for months, as the liquids are escaping out of the half cemented joints and fouling the earth and foundation walls until the stench becomes so unendurable that people ask to have their drains looked over, ignorant of the fact that they are entirely stopped and that not one drop of the sewerage is reaching its intended outlet."

Make Your Own Gas.

OWNERS of country stores and dwellings should use every precaution against fire, as the non-proximity of fire engines and scarcity of water oftentimes cause a small fire to develop into a disastrous conflagration. Since the first introduction of coal oil as a means of illumination, various contrivances have been placed in the market by which gas could be manufactured from that substance. For more than twenty years improvements have been made in gas machines, until there has been developed one that is as near perfection as scientific study and investigation can produce.

These machines are guaranteed absolutely safe in their operation, simple in construction, not liable to get out of order, and require no skill to manage. They require less attention than a common kerosene lamp. *No fire is used in the process of manufacturing gas by these machines.* Cost of gas will be less than one dollar per thousand feet.

The tank, containing the gasoline, is buried in the ground and is delivered in permanent pipes and fixtures to the proper distributing points. Consequently no danger or trouble is engendered by frequent removals of the fluid. Full particulars in regard to these machines will be given by addressing A. F. Nye & Co., 609 Market Street, San Francisco, who are the sole agents for the best machine manufactured.



FRONT ELEVATION OF $5,000 COUNTRY DWELLING.—SECOND PREMIUM DESIGN.

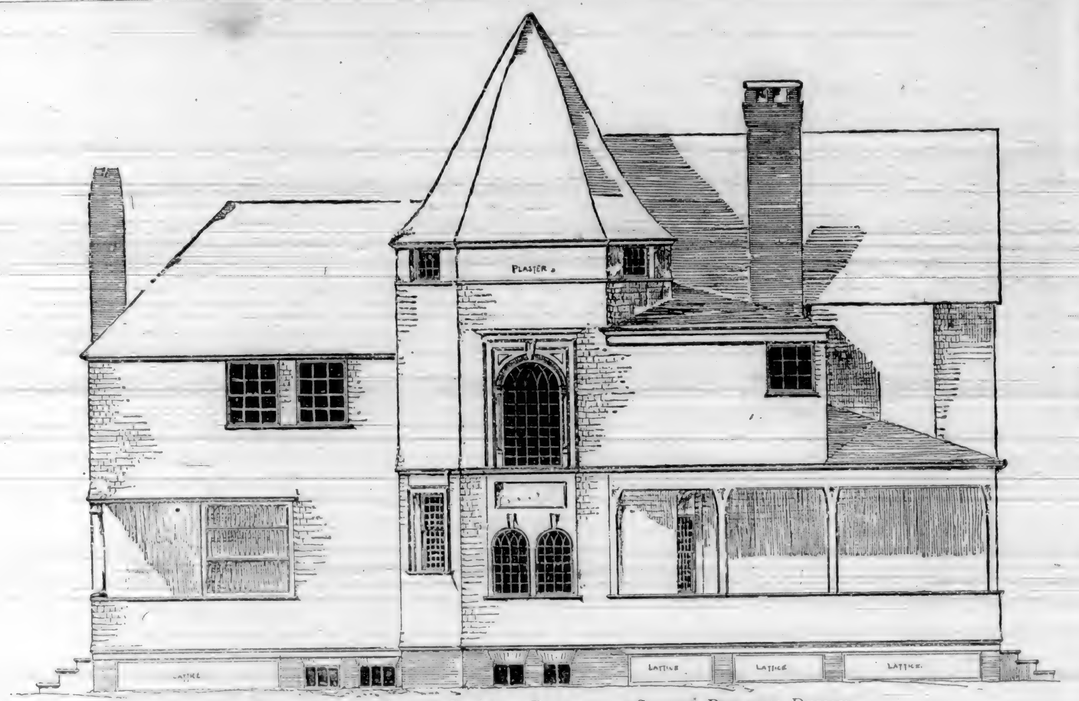
Our Competition Designs.—Second Premium Plans.

IN this issue we present the various elevations and plans of the gentlemen receiving the second premium in the late competition held under the management of the editors of this Journal. Under the *nom de plume* of "Garrick," Mr. John C. Wolf, of 57 Broadway, New York, is the party to whom the credit is due for presenting plans in so creditable a manner as to win the second premium.

The same fault is noticeable in this set as in those receiving the first premium, viz. *stories too low to suit California ideas.* The rooms shown are all of good size for the purposes intended for each, and in this section nothing less than twelve and eleven feet in height, respectively for the two main floors, would be considered by either owner or architect. Our "glorious climate" may have something to do with the apparent necessity of high ceilings; custom also being a prominent factor in this respect; the fact remains, however, that, on this coast, people will have high ceilings. The first floor plan is very well arranged, the greatest fault being the lack of sufficient closet room. In this, as well as every plan received in the competition, long narrow halls are done away with; in their place, we find a large, comfortable hall-way, well lighted, and with ample means for heating. The arrangement of the water-closet is, at least, a novel one in regard to position. It will be found preferable to have a door direct from the kitchen to the back porch, avoiding the necessity of the cook having to pass through the pantry.

On the second floor, the position and convenience of bath-room will attract attention. Keeping the water-closet separate from, and yet in immediate proximity to the bath-room, is a very commendable arrangement. The interior lobby or central hall, is, at least, a novel feature, its advisability would, in a measure, have to be determined by those erecting the house. More fire-places are shown than are necessary for this part of the country. The back stairs are a little crowded, but there is plenty of room for enlargement. Ample bed room is afforded in the attic for servants and the older children. Closet room is also abundantly provided. The basement contains sufficient room for all the purposes for which that portion of the house is intended.

The house is certainly picturesque in its outside appearance. We have not seen any-



SIDE ELEVATION OF $5,000 COUNTRY DWELLING.—SECOND PREMIUM DESIGN.

thing resembling it in this State. The elevations of the front, sides and rear being given, will enable any one to clearly understand how the house will look when finished.

ESTIMATED COST.

Below in full will be found the cost of the various parts of the work, as computed by the architect. It is greatly under the cost of the same design, if erected on this coast. The amount quoted for plumbing is greatly underestimated. Here we would not be satisfied unless each of the principal chambers contained a wash bowl. Multiply the figures given for plumbing by six, and the amount would be the average cost here of plumbing for a house of the size shown.

A great disparity occurs also in painting, the figure given would *at least* have to be multiplied by TEN, to obtain an estimate for which the work could be considered in this city. The price of lead and oil is very near the same as in the East, and we fail to comprehend wherein such a difference can occur. We give the estimate as prepared for publication and each one can study the differences in prices as they find time so to do.

California Architect—$5,000 House Competition—Submitted by "Garrick."

Estimate of Quantities and Prices of Materials in, or Vicinity of, New York City.

THE following prices are given, including the labor of putting in place, also, in their respective requisitions: the price includes the necessary mortar, nails, glueing, wedging, etc.:—

MASONRY.

Excavations, 290 cu. yds. @ 28c. per cu. yd.	$ 81 20
Stone work, Foundations, 202 cu. ft. @ 12c. per cu. ft.	24 24
Flagging, 6' sq. ft. @ 70c. per sq. ft.	42 00
Window sills, 11 @ 80c. a piece	8 80
Pier plates, 13 @ 50c. a piece	6 50
Chimney caps, 2 @ $4.00 a piece	8 00
Brick work, for walls and piers, 4,870 @ $18.00 per thousand	88 66
Brick work for chimneys, 1,060 @ $18.00 per thousand	19 08
Brick work for fire-place facings (pressed brick), 6 @ $19.00 a piece	114 00
Tiling for fire-places, 4 @ $22.00	88 00
Plastering (includes lathing). Outside (rough sand-finish), 14 sq. yds. @ 32c.	4 48
Inside (hard finish), ceilings and under side of stairs, 360 sq. yds. @ 35c.	126 00
Inside (hard finish), sides, 1,062 sq. yds. @ 35c.	371 70
Masons	$982 66

CARPENTRY.

Scantling, sills and girders, 6"x8," 241 ft. @ 40c. per thousand ft.	96 40
Plates and enterties, 4"x6," 454 ft. @ 40c. per thousand ft.	181 60
Studs, 3"x4"x12'-0," 620 sticks @ 24c. a piece	148 80
Sleepers, 6" diam., hewn on one side, 190 ft. @ 3½c. per ft	6 65
Floor beams, 2"x10"x16'-0," 72 sticks @ 40c. a piece	28 80
Rafters, 2"x8"x16'-0," 164 sticks @ 40c. a piece	65 60
Rafters, 2"x6"x12'-0," 22 sticks @ 35c. a piece	7 70
Furring strips, 1½"x3"x12'-0," 120 sticks @ 12c. a piece	14 40
Sheathing on roofs, 2,320 sq. ft. @ 5c. per sq. ft.	116 00
Sheathing on sides, 2,996 sq. ft. @ 5c. per sq. ft.	149 80
Shingles on roof (5" to weather), 2,210 @ $8.00 per thousand	17 68
Shingles on sides (4½" to weather), 2,990 @ $8.00 per thousand	18 32
Moulded and turned (exterior work). Water table, 163 ft. @ 25c. per ft.	40 75
Belt course, 28 ft. @ 30c. per ft.	8 40
Cornice, 251 ft. @ 38c. per ft.	95 38
Window sills and baluster rails, 140 ft. @ 22c. per ft.	30 80
Architraves on first story, 6 @ $5.00 a piece	30 00
Piazza approach steps, 2 @ together	9 00
" posts, square and cantilivers @ $8.00 a piece	40 00
Piazza post, round with cap and base	10 00
Piazza screen, 60 spindles @ 20c. a piece; one frame @ $5.00	17 00
Piazza sheathing of ceiling and sides, 620 sq. ft. @ 20c. per sq. ft.	124 40
30 windows, box frames, blinds, sash and architraves @ $12.00 a piece	360 00
16 windows for attic and cellar @ $3.00, swing on pivots	48 00
1 window, elliptical	6 00
1 " staircase	35 00
Carpentry	$1,716 08

JOINERY.

Doors, 3 outside doors with glass panels and trim @ $8.00 a piece	24 00
Doors, 1 outside split door	25 00
Doors, 27 4-panel doors @ $10.00 a piece (including trim and hardware)	270 00
Floors, 1,280 sq. ft., 9" wide @ 6c. per sq. ft.	76 80
Floors, 1,564 sq. ft., 3½" wide @ 10c. per sq. ft.	156 40
Baseboard, 432 feet, 8" high @ 25c. per ft.	113 00
Wainscot, 120 sq. ft., for bath-room and water-closets @ 25c. per sq. ft.	30 00
Jobbing, fittings for water-closets, laundry tubs, kitchen sink, coal bins, cold air box, etc.	30 00
Staircase, servants, 23 risers @ 20c., 21 treads @ 28c. 7 newels @ 4c., 42 balusters @ 20c., 14 feet of rail @ 17c., total	24 20
Staircase, main, 32 risers @ 30c., 21 treads @ 40c., 4 rounded treads @ $1.00, 16 newels @ $1.75, 153 balusters @ 60c., 5 landings @ $3.00, 51 feet of rail @ 40c., total	177 20
Allow for bed-room mantels, 5 @ $15.00 a piece	75 00
Allow for parlor finish with mantel	100 00
" dining-room finish with mantel and side-board	150 00
Allow for first story hall finish with mantel and vestibule	100 00
Allow for second story hall finish with mantel	75 00
Allow for fitting shelves and doors to medicine closet	8 00
Allow for fitting shelves and hooks in other closets	12 00
Allow for shelves and glass doors in cupboard in butler's pantry	10 00
Interior finish, total	$1,456 60

TINNING.

Flashings, 630 sq. ft., all painted and laid @ 10c. per sq. ft.	63 00
Gutter, 140 feet of 5" gutter @ 4c. ft.	5 60
" hooks, 30 ornamental @ 20c. a piece	6 00
Leaders, 90 ft. of 4" leader pipe @ 5c. per ft.	4 50
Leader straps, 12 ornamental @ 40c.	4 80
Tinning, total	$83 90
Heating furnace (including register faces and pipes)	220 00
Range in kitchen with hot water back and connections	50 00
Heating, total	$270 00

PLUMBING.

Bath tub, 1 copper bath tub with plug and connections	10 00
Water-closets, 3, traps and safes @ $22.00	66 00
Wash bowls, 1, cocks, plug and marble top and back	7 00
Laundry tubs, 3, linings and connections, with cocks and plugs	3 00
Sinks, 2, kitchen and pantry, with strainers and cocks	8 00
Boiler, 1, galvanized iron, with gal. stand and connections	18 00
Soldering and leading	10 00
Plumbing, total	$122 00

PAINTING.

One cask of stain for shingles, 10 gallons @ $1.50 gal.	15 00
1,020 sq. ft. of 3-coat painting (exterior) @ 3c. sq. ft.	30 60
Interior painting included in above allowances.	
Painting, total	$45 60

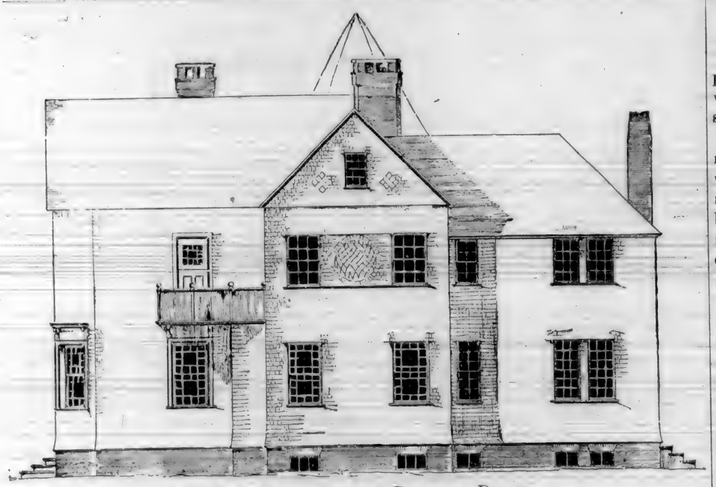
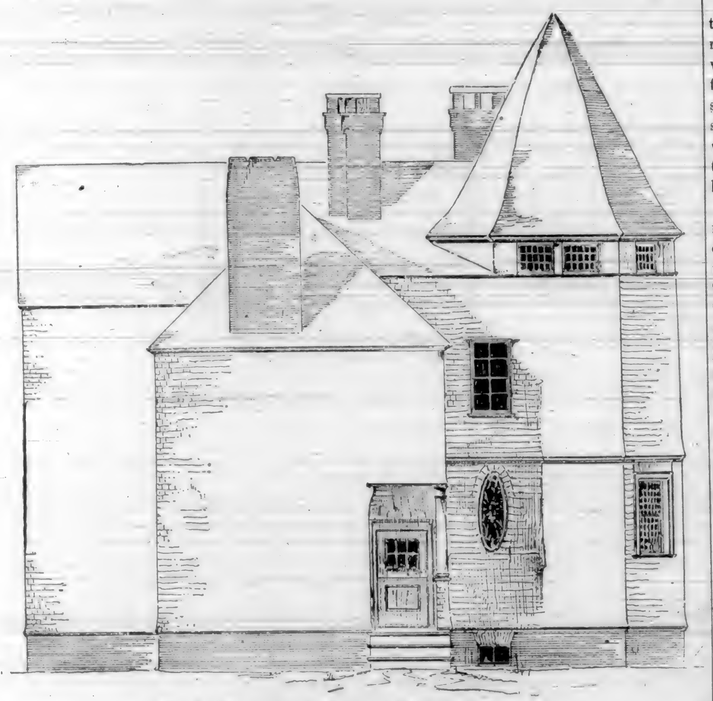
THE WAY IT HAS ALWAYS BEEN.—The constant clash between capital and labor is thus epitomized in the *American Miller:* "To get much for little is the real quintessence of happiness. Much for little has been the cry of Jew and Gentile for thousands of years, and to get much for little, men sacrifice their fortunes, their lives, and their sacred honor. On the one side, to get much money for little work, and on the other side, to get much work for little money, makes most of the troubles between employer and employed. It has been so in the past, and will be so in the future, until the end of time, all legislation to the contrary notwithstanding."

Complete Details. $2.00.
Universal Assistant. $2.50.
Cutting Tools. 2.00.



SIDE ELEVATION.—SECOND PREMIUM DESIGN.



REAR ELEVATION.—SECOND PREMIUM DESIGN.

THE coming question is, how to divide the profits fairly between capital and labor, and give each their proper share. Unfortunately labor cannot share losses. If $50,000 is made one year, labor steps in for its share. If the same is lost next year, capital must sustain the loss, as labor spent what it made the previous year and cannot refund what it has not got. When labor gets forehanded enough to make a fair deal on losses as well as profits, does not labor then become a capitalist? Or, how much must a man be worth before he can be known as a capitalist? Where is the dividing line?—*Ex.*

Lunch or Dinner—Which Is Best for the Mechanic at Noon-Time?

OPINIONS differ in regard to the subject, and perhaps a few thoughts as expressed by various mechanics, may prove interesting to some readers.

Advocates of a hot dinner at the regular noon hour claim that it is much preferable, when possible, to sit at a table where the meals are served hot; that the walk from the building to the hotel or restaurant, is in many cases a needful change of exercise, especially when one has been working steadily at the bench; also, the mind receives rest by the different sights encountered, enabling the workman to put aside cares and trials for a while, so that upon his return his mind as well as body will be fresh to encounter any perplexities that may be met. Stress is laid upon the fact that the lunch men, especially when the day has been warm, and underclothes soaked with perspiration, are liable to colds or chills, from sitting around a whole hour in a tool house, or on the shady side of the building. Many other arguments are used, but the foregoing are the principal.

On the other hand, the lunch men claim that, in order to get a hot meal, one must be ready to instantly drop tools the minute the whistle blows, or upon the call of time by the foreman, in order that not a minute be lost, so that the "hot meal may be got at" in the shortest possible time. Rush, must be the word—to the meal, eating the same, and back to the building—all to be done inside of one hour.

The lunch men also claim that hot coffee is not the only stimulant necessary for the dinner men, and that *the other hot* is one of the principal reasons for a walk to dinner. The claim in regard to brain rest is all bosh. The latter named portion of the anatomy receives much more rest by an intelligent discussion for half an hour on the quickest method to find the length and bevel of any brace, rafter, etc. After a warm morning's work, the workman is exceedingly particular to pick out a nice warm spot, free from draft, where lunch can be eaten without danger of catching cold. Twenty-five minutes is an ample space of time in which to satisfy nature's cravings, leaving full thirty minutes for rest.

Each side advances good arguments in favor of their respective views. We are promised several communications upon the subject, and will publish those that are the most suitable. We will be pleased to hear from any of our mechanical friends in regard to lunch or dinner at the noon hour.

Every mechanic should at once send us $2.00 for one year's subscription to this Journal. We are earnestly laboring for your welfare, and advancement in the art of building correctly. Not only do we present in each issue all the latest developments in the science of carpentry as practiced on this coast, but we also give you the cullings of the principal Eastern journals. Back supplied. Bound volumes $2.50 each.

Every Architect on the Pacific Slope Should Become Identified with the S. F. Chapter American Institute of Architects.

A WONDROUS change has come over the architects of this city since the Chapter has become an assured success. It is now over three years since the architects resolved that it was for their general interest to encourage social intercourse with each other, and to hold meetings at which interchanges of ideas could be considered. At first it was a hard undertaking for the active originators of the Chapter to convince many of their brethren that it would be to their advantage to become identified with the Chapter. The impression seemed to prevail that it was for the best interests of architects to keep the knowledge gained by individual study to one's self. Plans were not allowed to be seen, elevations hidden from sight, for fear that the ideas shown would be copied. A careful concealment of intended improvements was practiced, so that a rival would not hear of the same and endeavor to convince the owner that a change of professional help would inure to his benefit.

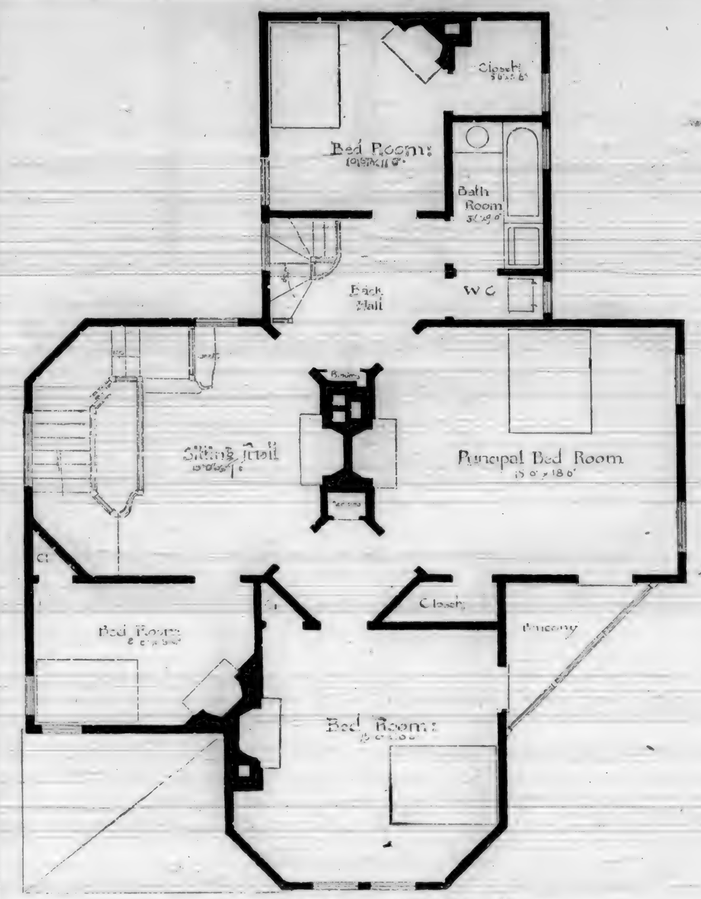
Very different now is the feeling among the Chapter members. They vie with each other in extending courtesies. Friendly visits are occasionally made, greatly to the benefit of each party. Vexed questions are considered at these visits, and the visitor retires convinced that the architects are now in the right path to make their profession an honorable one among all classes of the community.

We earnestly call the attention of our country brethren to the necessity of becoming identified with the Chapter. The benefits from so doing will more than compensate for the small outlay required. For the information of those intending to join, we quote the fees and dues necessary to become members.

Membership is divided into four classes: Fellows, Associates, Draughtsmen, and Students.

	Initiation Fee.	Dues Per Year.
Fellows	$6.00	$6.00
Associates	4.00	4.00
Draughtsmen	3.00	3.00
Students,	2.00	2.00

A copy of the by-laws, and any information in reference thereto, will be furnished by sending address, etc., by mail, or personal application to the Secretary, B. E. Henriksen, at his office, 218 Post Street, San Francisco.

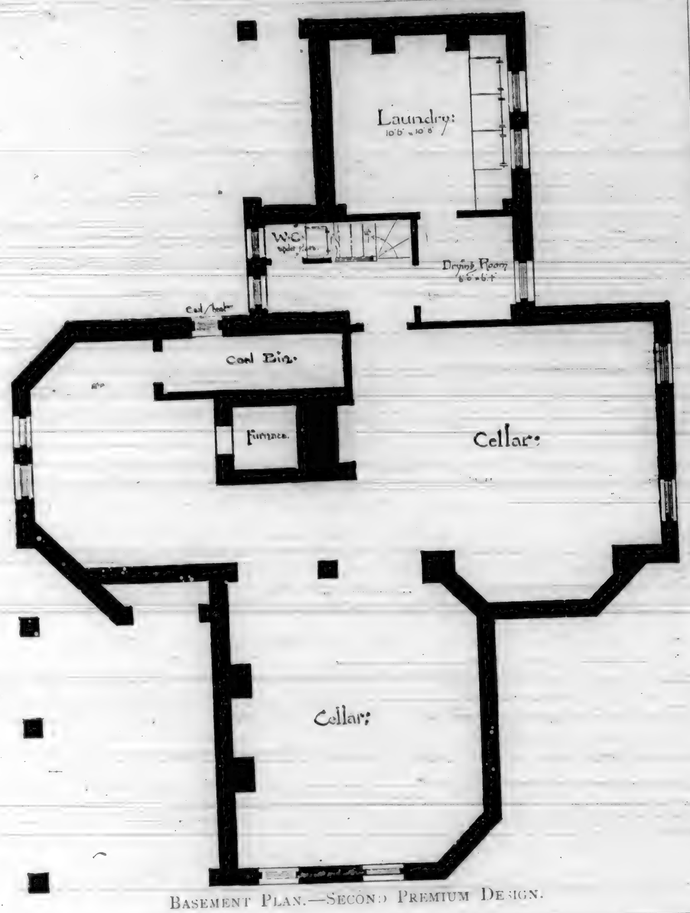


SECOND STORY PLAN.—SECOND PREMIUM DESIGN.

Joinery.

THIS important branch of carpentry was comparatively unknown in the early days of mechanical arts—the first dawn of the existence appearing in the construction of thrones, pulpits, and screens used in churches and cathedrals. The work was evidently performed by the carvers of the period, as this less artistic portion bore signs of carelessness, such as an artist would likely bestow upon what was altogether mechanical. When, however, carving assumed more classical pretensions, and joinery became necessary to the furtherance or perfecting of special modeling, then it was developed into a special department, and carried to a degree of excellence scarcely found among joiners of the present day. It is to the influence of this new study that the world is indebted for the light window sash, paneled doors, wainscoting, handsome mosaic floorings and a host of other interior decorations now so common. The inventive genius found scope in the improved practice of the science to produce machinery which not only assists the expert's joiners, but enables them to perfect work hitherto but partially well executed. There is still much room for improvement and invention. Wood shrinkage must be overcome, or so counteracted as to render the joiner's labors durable. The tools used by joiners are endless in variety, and need to be of great accuracy, so that the most perfect lines of the truth-telling rule may be adjusted with a precision barring detection. The work is necessarily tedious, and at times irksome, therefore of the number of mechanics who attempt the acquirement of the trade, but a small number reach the summit of excellence. —*Ex.*

OCCASIONALLY we hear complaints of putty that shows through the paint that covers it, in stains that even several coats of good paint will not remove. We have taken pains to look into the cause, and find the trouble due to the use of cheap oils as substitutes for linseed oil in making the putty. Painters who are troubled with stains of this kind will do well to learn whose make of putty they have used, and to forever afterwards avoid it. Some cheap putties are made with a portion of fine marble dust mixed with it, as a cheapening process, as marble dust is cheaper than whiting. Some glaziers prefer it, as it works smoother than the regular article and takes hold well, but in most respects it is a quite inferior article. The old-fashioned putty has never been improved upon much, and is a pretty good thing to stick to.—*The Painter.*



BASEMENT PLAN.—SECOND PREMIUM DESIGN.

Practical Workmen.

NO MAN can be said to be a practical workman unless he thoroughly understands the theory as well as the practice of his employment. Some men are content in the simple accomplishment of results without endeavoring to study the why's and wherefore's which lead to their production. Some workers accept without investigation the formulas of their trade, and do not aspire to a knowledge of the principles upon which these formulas rest. They may be very good artisans in their way; they may, so far as their immediate tasks are concerned, be excellent workmen, but it is needless to say that they are not composed of the material which makes the great, the rising, and progressive spirits of the age. —*The Wood-Worker.*

WE would like to place your name on our subscription book, if you are not already a subscriber.

THE following is given as the weight of hardwoods per foot, board measure. Some allowance must be made in the weight of fresh cut, as the same wood differs some in weight when green in different localities:—

Name of wood.	Green. lbs. to 1 ft.	Dry. lbs. to 1 ft.
Ash	4½	3¾
Apple	5	4
Beech	5	4½
Birch	4½	3¾
Basswood	3½	2½
Chestnut	4	3
Cherry	4½	3 1-5
Cypress	4	3
Cedar	4	3
Elm	4	3
Hickory	5	4½
Holly	5¼	4½
Lignumvitæ	9	8¼
Maple	5	4½
Mahogany	5½	4½
Oak	5	4½
Poplar	3½	2½
Rosewood	8	6¾
Walnut	4½	3 1-5

—*Miss. Valley Lumberman.*

Adulterated Oils.

LIKE all other trades and professions, that of the painter has met with many a serious drawback by the materials he uses being adulterated. At the present time, linseed oil seems to have undergone a great metamorphosis, inasmuch as out of thirteen samples, procured from all parts of the country, none were found without traces of adulteration, and in some instances there were more deleterious matters than linseed oil. Artisans use these oils, fail to make a good job, and receive all the blame, while those who have profited by the adulterations go free. It is not the dealers or even the manufacturers who make these adulterations, for they are more anxious than any one to send out pure oils, as they have a reputation at stake, to maintain which is utterly impossible if their goods are found to be tampered with. One sample of adulterated oil, drawn from a lot ready for export, was found to contain cotton-seed oil, resin oil, a sulphuretted oil and fish oil, and exhibited the property of dichroism, showing a yellowish-red tint by transmission and a blue by reflection. Distillation would separate nearly all the resin oil, the residue in the retort lost its phenomenon of dichroism. The presence of resin may be proven by boiling for a few minutes with an excess of alcohol at 90°, decanting and treating with natural acetate of lead, the result, if a curdy precipitate, shows the unmistakable evidences of lead. If the oil is now subjected to the action of the vapors of nitric acid, and set aside, a semi-solid reddish-brown mass will probably be deposited; then to detect the presence of any animal or fish oil, pass a current of chlorine gas through the sample for nearly an hour, when, if present, a reddish-brown color passing into violet will then turn a blue-black. With all these indications there need not be the least doubt as to the nature of the adulterant.

Another article of great importance is white or oxide of lead, and perhaps in a long catalogue of paints there are none adulterated to the same extent. To retain its weight heavy materials are used, and the color retained by the use of alkalies. The easiest way of determining the adulterants of this article is to extract the lead by means of a flux; this will seize upon the minerals other than lead, the increase weight of which shows the adulteration, while the lead is secured as a bright button, the careful weighing of which will tell the per cent. of this element; thus we have two very simple tests, either of which is correct, and the results obtained are beyond all question.

As before stated, it is not generally in the legitimate channels of trade in these goods that we find adulterations, but almost invariably a class of unprincipled jobbers, not known or even recognized in trade, dare not meet fair and honest competition in market, who employ the requisite skill to concoct adulterated articles of all kinds. It may be stated as a fact that when we find parties selling goods very much below all competitors, these goods are not pure, for the margins of all goods have been cut down to the smallest possible point commensurate with expenses, and no sane person does business for honor to lose money.—*Johan Frederic Elsom, in the Painter.*

School Department Matters.

TO SAY that the management of our public school interests is disgraceful, would scarcely express the state of things that have been and are in the hands of the present Board of Education. It would be as well or better for the educational interests of the city of San Francisco, if the present Board would change places with an equal number of fairly advanced—not necessarily high school scholars. If the boys should lack the wisdom which the experiences of manhood *should* bring, they would at least practice sufficient self-respect individually and collectively to avoid the numerous word encounters that have, during the term of office of the present Board, disgraced that body. If the same number of lads in either of the grammar or high schools should behave and act toward each other and their superiors as badly and as undignifiedly as the members of the Board have acted, they would be severely dealt with, and perhaps "tunned out of school," as violators of right rules, and as bad examples to good pupils.

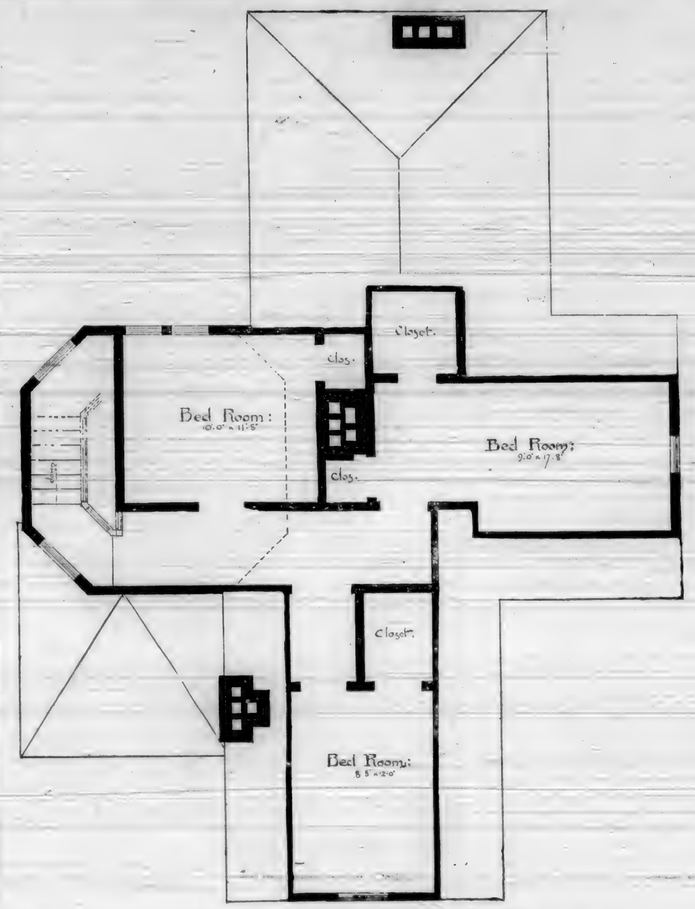
It is a great pity that the members of the Board cannot see themselves as every intelligent citizen sees them, and with shame-facedness vacate the positions held by them. But unfortunately in this land of ours, men in official position, not blessed by nature with sensitive mind and a reasonably high and refined order of intellect, reject and poise themselves above public sentiment, and act as wise and good men would not dare to act. But nothing that might be said or written is likely to produce a change in some of the members of the present Board, and the interests of the school department will have to suffer on, until by lapse of time the present manipulators of the school interests of our city shall settle back into their individual retirement, with no ray of prospect of ever again being intrusted with like public responsibilities.

In the matter of honest management, the facts made public, and others not yet fully exposed, in addition to secret manipulations which may never see the light, draw around at least some of the present Board a suspicion of the darkest dye. There are none conversant with the affairs of the department, who question the existence of great irregularities in numerous ways, and the use of the situation for personal and party advantages. It does seem that, unless the twenty-four hands of the twelve composing the present Board, have been more or less, or in some way dipped in some of the various contaminated streams flowing through the department, an exposé should be made, which would reveal more fully the hidden and unpublished workings, and open to clearer view the parties who are using a great public trust for personal and political gains and profits. The carpenter shop revelations, the lumber, plumbing, painting and numerous other transactions, manipulated and practiced under the disguise and at the cost and expense of the school department, should arouse every good citizen to a correct understanding of the necessity of electing as school directors not simply men of fair repute as citizens, but men of unquestionable and fully demonstrated purity and firmness against all political deviltry.

The methods of filching from the school funds and depriving school teachers and pupils of their rights under the school laws of the State, are not the result of clean hands and honest hearts. The marks and foot-prints of dishonesty and corruption are so transparent, and the machinations of those more guilty so outrageous, that it would be more an act of mercy than a miracle, if Almighty God should send an avenging angel with whips and scourges to drive out from the temple of education in San Francisco, as was done eighteen hundred years ago in Jerusalem, the rascals and evil-doers who perverted the sacred places to base purposes.

The daring affrontery and the deliberate coolness of the operators within the school department circle, if but one-half of what appears on the surface be true, may well surprise intelligent and honest people. But it is a well-understood fact, that in all cases of irregularities in human affairs, coolness and boldness are prerequisites to success. This is the testimony of "Black Bart," and all others of his kind, who preferred the dangers of a highwayman's life to the less manly and more ignoble pursuit of securing and dispensing to auxiliaries public funds through official position. The one demands and calls into exercise courage and the staking of one's life upon the issue, while the other is simply a toning down and modification of a like principle, involving neither personal courage, risk nor danger, so long as the perpetrators can conceal, gloss over, and manage to keep themselves just beyond the reach of criminal law.

The "higher law," which in the earlier history of San Francisco dealt with bad men as their conduct deserved, is a terrible resort to contemplate; but party corruptions and official depravity, continued and perpetrated with a too great boldness, may yet suggest measures not provided in the statute books of the State of California.



ATTIC PLAN.—SECOND PREMIUM DESIGN.

Authorize Firemen to Apply the Ax.

THE telegraph and telephone are necessities. Wires are necessities. The reliable and cheap transmission of messages is a necessity. Fire extinguishing machines are necessities. Corporations are necessities, and so are streets and high buildings. These different necessities collide. A big fire disjoints them all and they are confounded with confusion. Each conflicting interest then claims precedence and pre-eminence. Is there not some almost natural law that should determine which of these interests must bow down?

What is the most universally natural thing sought to be accomplished in the case of a great fire, which may involve life as well as property? Why, it is to subdue the fire as quickly as possible. That consideration is then held paramount to all others. If it is right to let such an impulse govern when a fire is on hand, the same idea should be the controlling one when there is no fire and when the only object is to so regulate the surroundings of property as that it may be saved when the flames break out.

The public necessity for telephone and telegraph should be pushed to the background before fire comes, so as to give extinguishing machinery a free chance to save property. A convenient passage of wires should be the secondary consideration.

We believe in the heroic remedy which has been devised but not really practiced in Chicago. Order the wires out of the way, and, if they are not withdrawn, remove them, and clear the streets of such hindrances of access to buildings by firemen. Let the wires be barred from any aerial passage across or along streets. Let the companies carry their wires underground or in a glass tubing along the sides of blocks or in any way they choose except through the air as now.

The cost to the public would be immense at first. The public would have to pay high for uncertain and unreliable service. After a while, however, that would all adjust itself and competition would operate to lower rates again. The companies would find ways to get their wires underground and make them work well there. And until they are most violently compelled to they will not find those ways nor abandon their aerial routes.

Meantime the public would save in another direction. The people's property would be saved from the flames to an extent which would more than make recompense for the higher rates which would be charged for m ssages. The value of the property which has been destroyed in St. Louis directly on account of firemen being impeded by telegraph wires, would many times pay for the cost of putting all the wires underground. This is an assertion that is impracticable to be proven by specific instances and figures, but every careful observer of our fires knows that the probabilities are strongly favorable to the assertion.

There is a possible remedy which seems to us easy of application, although it would perhaps lead to some rather dramatic scenes. Assume that an ordinance should be passed in St. Louis directing that after a stated reasonable time it should be the duty of firemen in service at fires to tear down and remove all wires and telegraph posts which impeded them in the extinguishment of fires. It would be safe to warrant that in a very short time the firemen would worry the companies into finding underground routes for their wires. There ought to be such a law rather than one protecting the wires. In a large city there is always a vast danger of a fire growing to enormous proportions, if quick access to it be prevented. After it had grown nothing would be too sacred to tear away in order to stop it. Why, then, should the wires be sacred at the start of a fire?

The direct fight against wires is inevitable. The longer it is postponed the more desperate it will be. It is sure to be a violent fight, if successful. The quicker it comes, the better. The more violent it is, the more speedily it will end. Authorize the firemen to cut, and down will go the wires forever. Courts will sustain the necessity of getting at fire to extinguish it.—*Western Insurance Review.*

Fire, Flues, and Chimneys.

PROPERTY augmenting millions of dollars annually, is destroyed by "defective flues" as the cause, and the fiery elements as the agency of destruction. Yet these often repeated and multiplied warnings have but a limited effect in the matter of flue construction.

As a general thing, owners do not, practically, care anything about how the flues in their houses are built, leaving the whole matter with their architect or builder, without remark or comment. This is well, provided they shall have secured the services of a competent and careful man of plans, who *will attend to it*, and see that the flues are properly built and plastered inside. But if he is neglectful, and trusts wholly to the "chimney builder," and that individual happens to be not a competent and careful brick-layer beyond and in addition to building chimneys, defective flues are very certain to result. There is a class of would-be brick masons who claim special qualifications in the erection of chimneys, mainly because they are incompetent to take their places in line with good men in wall work. In a limited number of cases, such men learn fairly the art of flue construction, but as a rule their mechanical incompetency is notorious, and if they happen to build a safe and good flue, it is more the result of it happened-so, or from abstract routine, than from good judgment, careful work, or a right knowledge of how the good result came about.

The danger from the cause under notice is far greater than is generally understood. Thousands of flues to-day which have not thus far caused conflagrations, are nevertheless in the exact necessary condition to serve that purpose at any moment when slight circumstances arise; they are comparatively "sleeping fires," ready and liable to break forth in flame at any moment, from exceedingly slight causes; and the unseen and unrealized, "barely-escaped-from fire" cases in all communities, are very large, and the sense of safety indulged in in a large proportion of dwelling-houses is more fancied than real.

The Science of Drying.

THE science of drying is in itself exceedingly simple, but to those who are entirely unacquainted with it, it is very mysterious, for the reason that the medium for carrying off the water, being air, is not visible. Water and other substances which can be seen are much more readily understood.

All the science there is about drying, is that the air absorbs the moisture as a sponge absorbs water. In winter, when the out-door air is dry, as it usually is (the frost condensing the moisture in the air), it will, if heated up to, say 150 degrees, take in or absorb moisture much more rapidly than in summer, when the out-door air has from 50 to 80 per cent. of its capacity for absorbing moisture already loaded; precisely the same as a sponge, when dry, absorbs water in large quantities and more rapidly than when it is wet. Heated air absorbs moisture in proportion to the increase of temperature, its capacity for carrying large quantities of water being increased by the heat. A cubic foot of air at 32 degrees will carry off only two grains of water, while at 160 degrees it will carry off 60 grains—hence the necessity of heating the air, which should be as dry as possible, and made to move rapidly, so as to wipe off the moisture from the surface of the lumber or other fibrous material as soon as it reaches the surface, as it works its way out from the center of the body being dried.

All moist, green or wet substances requiring to be dried, should be treated in precisely the same manner, whether it be lumber, brick, wool, cotton, corn or other grain. The process of drying all these is the same, viz., the rapid circulation of heated air. *The Wood-Worker.*

NEW PUBLICATIONS.

Day's Collacon. An Encyclopædia of Prose Quotations, consisting of Beautiful Thoughts, Choice Extracts, and Sayings of the most eminent writers of all nations, from the earliest ages to the present time, together with a comprehensive biographical dictionary of Authors, 40,000 quotations, 8,000 authors, 2,000 topics, 125 beautiful portraits in steel and wood. Day's Collacon is an encyclopædia of prose quotations, and one of the amplest dimensions. The number of authors whose works are quoted in the collection is said to be eight thousand, comprising the chief names in ancient and modern literature. The quotations are ranged under two thousand classified headings, and amount to some forty thousand. As to the quality of these grains of wisdom there is probably not one which has not a profound value for some order of mind and some mood of feeling; at the same time, it must be acknowledged, there are whole pages that certain fastidious students and advanced spirits will pass over as commonplace. This is inevitable from the vast plan of the work and the limitless progression of intellectual development. The compiler has manifestly not undertaken to suit the needs of any particular person or class, but he has made an immense gathering of waifs from the ocean of literature, and he invites every one to come and take what he fancies or needs. The materials are indexed so as to make reference easy and direct. The author's names, with biographical notes, are given in the appendix, making in themselves a quite convenient dictionary of literary biography. An attractive feature of the volume is the series of portraits which are scattered through it, numbering, large and small, a hundred and twenty-five. The price of this work has been placed at $12.00. A copy is in our office, and we will take orders for the same.

P. J. Barber.

WE present in this issue an engraving of an architect whose skill has done much towards beautifying the section of country in which he is located.

Mr. Barber was born in Nelson, Portage County, Ohio, in 1830. He was by nature a mechanic, as was his father and his older brothers, three of whom were master builders; and from them his mind was early inclined to that branch of mechanics which has resulted in such developments of his genius as unfavorable circumstances would permit.

In the spring of 1847 he was apprenticed to a cabinet-maker, where he gave entire satisfaction, attending the academy three months during each winter. But relief was sought from the monotony of country cabinet shops, by engaging upon the best of work in the city of Cleveland, Ohio; and after finishing his apprenticeship he resolved to strike for something more exalted, and at once commenced the rudimentary studies of building and architecture.

For the period he worked as a journeyman carpenter and joiner, and down to the present time, his knowledge of cabinet work has been of daily practical use to him; and he has had no regrets that, while acquiring the use of tools, he at the same time gained a thorough knowledge of the highest order of wood working.

Possessed of an enterprising disposition, Mr. Barber was not contented with merely listening to the stories of fabulous wealth that could be obtained in the then new El Dorado on the Pacific Slope, and so we find him on his way to California, by the old Isthmus route, arriving in San Francisco on the 22d of May, 1852, after a voyage of one hundred and eleven days.

P. J. BARBER.

Old Californians may remember the barque *Clarissa Andrews;* it was on that "floating coffin," as she was appropriately named by Prof. J. W. Pike, one of the unfortunate passengers, that Mr. Barber made the voyage from Panama to this port, accomplishing the same in sixty-five days. Upon his arrival in San Francisco, he again turned his attention to his trade, first as a journeyman, but soon assuming the role of contractor and builder, in which he was reasonably successful.

In early times, in San Francisco, his offdays and evenings were mostly spent in the libraries and in the society of architects. Many will remember the lamented "Reuben Clark," then in the zenith of his fame, and engaged in the plans of that proud monument of his genius, the State Capitol Building at Sacramento. Mr. Barber profited much in having the confidence and friendship of that learned man—his wise counsels and lessons in architecture, the principles of which he then became more familiar with, have been a source from which he has drawn on countless occasions during his practice.

Thus we see that Mr. Barber's career has been a gradually progressive one. Having mastered the principles of architecture, he assumed the practice of his profession in this city previous to 1869, when, for the health of his family, he determined to take up his residence in that beautiful city by the sea, Santa Barbara, where he has followed architecture as a profession until this time, and has planned and had charge of nearly all of the important buildings that have been erected in that city, amongst which may be mentioned the County Court House, the College, the Arlington Hotel, the Presbyterian, Congregational, and other churches, several school buildings, the theater, Cook's Block, First National Bank, and others. He has been nearly three years engaged as architect upon a large classic dwelling (Italian), and it is still incomplete, the owner of which expects it will stand when all others now built in this country will have crumbled to the ground.

Mr. Barber still feels that San Francisco should be his home, so far as business is concerned; and it is there he points with pride for the best buildings (for their uses) in the United States, not only for the enduring character of the work, but for symmetry, proportions, and their elegant and appropriate decorations.

It was with many regrets that he was obliged to leave the city of his adoption, and the many endeared friends and associations of early times; and nothing now affords him more pleasure than meeting with his old brother carpenters and the pioneer architects of San Francisco. The latch-string of his door will always be found on the outside, so all of his old friends, professional brothers, though strangers, should feel that they will be welcomed by him at his home in Santa Barbara.

$160,000 Flue.

SINCE the last issue of this Journal, a single fire, consuming a splendid $160,000 residence in Alameda Co., is said to have resulted from a defective flue. The architect in the case was and is a most capable man, but he likely trusted the erection of the chimneys and flues to the "mason," or "chimney builder" as the case may be. Who is to blame? That depends altogether upon where, under the circumstances of the case, the responsibility rested. If the owner interfered and reserved, assumed, and exercised certain dictation and direction, then to that extent *he* is responsible for the resultants. But if absolute and unrestricted control and jurisdiction was given to the architect, the only excuse or relief possible for him is, that he trusted that part of the work to a "reliable man," and did not personally inspect, at least not more than casually so, the execution of the chimney work. Result and loss to the owner is all the same nevertheless.

Cottages. A new work that recommends itself on account of the number and variety of plans presented. Price, $1.00.

Buck's Designs. For its size, one of the best books that has been presented to the public. Price, 50 cents.

The Late Fair.

SOME of the exhibitors in the late Fair, just closed, deserve special mention for the excellent display made.

PACIFIC SAW WORKS.—We think the Directors of the Fair should issue a diamond medal to be given to the firm making the best display. If such had been the case this year, the *Pacific Saw Works* would probably have been the one to receive the medal. In the artistic arrangement of saws, and the great variety shown, the company is deserving of special mention. Every variety of saw, from the mammoth seventy-two inch circular to the finest dentist's instrument, was exhibited by the company. This is strictly a home industry, and should be fostered by every mill-man and mechanic.

COOS BAY LUMBER AND STAVE COMPANY.—Although comparatively a new company, the exhibit presented would compare favorably with those in the older cities. Every variety of bucket, tub, and barrel is made, and the work and material is of the best quality.

CALIFORNIA ARTIFICIAL STONE COMPANY.—In another place we refer at full length to the meritorious exhibit made by this company.

HARVEY'S RADIATORS.—Every size of these noted heaters was shown, and the inventor was on hand to fully explain their working.

WEED & KINGWELL.—A beautiful exhibit truly, and one that proves that the manufacturing interests of San Francisco will be the means yet of making this the second city of the Union. Every description of brass work, and every shape and size of bells are made at this establishment.

G. W. CLARK & CO.—Artistic house decorations are now receiving the most careful attention of architects. The exhibit of this firm was a beautiful one, and drew around it many owners calculating to build. We noticed several of the latter in consultation with various architects, discussing the various styles of wall decoration. Stained glass is also a specialty of this firm.

JOHN MALLON.—The pioneer in artistic stained glass work was on hand with a novel and unique arrangement of stained glass in every conceivable form and pattern.

OSBORN & ALEXANDER presented a variegated assortment of every description of carpenters' and mechanics' tools. This house has fairly won the reputation of the leading supply house for fine tools.

BROWELL'S CHIMNEYS.—Mr. Browell had the advantage of compelling most every one who visited the Fair to gaze at his exhibit. Every variety of patent chimneys and tops, sewer pipes, etc., was shown.

MONTAGUE & CO.—Marbleized mantles, art tiles, ranges, grates, architectural decorations, etc., were exhibited in profusion by this firm. The new quarters on Market Street are well worthy of a visit by those desiring the latest patterns in above mentioned articles.

E. G. DENNISTON, of the San Francisco Plating Works, proved by his display that this city can furnish as good work in his line as any of the older cities. Every description of table ware is plated at this establishment.

FRANK P. LATSON presented a fine collection of bronze hardware.

BURR'S HOPPERS.—All the various styles were shown, and received much attention from those interested.

GRANOLITHIC PAVING COMPANY.—A notice of this new company appears in another column.

Good Bricks and Brick-work.

THERE are certain criteria of good bricks, which, being infallible and readily applied, constitute the best practical tests as to the quality of these valuable materials. In the first place, good bricks are always heavy—always solid and compact, ringing with a clear, sharp sound, when struck together, and well and truly formed with nice, sharp edges. Neither will they absorb much water. If you have to choose between two bricks of equal or nearly equal weight, immerse them in water after weighing them dry. Twenty-four hours after take them out, and reject the one which has acquired most weight, and therefore imbibed most water. Over-burnt bricks may be heavy, but they are also cracked and distorted in form by undue heat, and may be readily distinguished from the better sort by their general appearance. Bad bricks, on the contrary, are light, will not ring at all when struck together, are ill-shaped, hollow on one side and round on the other, readily abrade on the edges, suck up water like a sponge, and indeed are sometimes so soft that a strong thumb may force off the edges, such as they are.

Good brick-work is laid truly and accurately to a level, every joint answers truly to the line, and every part of the face coincides with the plumb. All the beds and joints are well filled with mortar until it is fairly pressed out in the faces; all deficiencies are carefully pointed up as the work proceeds, and the whole well flushed in course by course. The mortar is well mixed, lime and sand thoroughly blended, and the sand, if handled alone, is found to be clean and sharp to the touch, feeling thoroughly gritty, and free from all slimy, greasy, and tenacious qualities. The joints are never to exceed three-eighths of an inch and should never exceed one-quarter of an inch in thickness, and the vertical lines must be truly plumb over each other in such courses as intended, according to the kind of bond employed. The work is also carried up uniformly level throughout, and no difference permitted even for a temporary purpose, under any circumstances whatever. By these means only can unequal settlements be prevented. Contraction of bulk or settlement we know must occur from the combination of materials in an expanded condition, as mortars and cements are, when in a plastic form; and therefore all walls must sink or settle down as the mortar becomes dry, but it is essential, to prevent dislocation, that this settlement be uniform throughout, and this can only be secured by adopting the precautions prescribed above. For the same purpose the back and interior of the work must be brought up, laid, and finished as completely as the front, and no gaps or crevices left for subsequent patching. One other rule has to be observed, and we reserve it to the last, and separate, and emphatic statement, to show our estimate of its importance, in order to produce good brick-work, which is this—that the mortar should be as thick as it may be, or as nearly approaching the solid form as is consistent with the degree of plasticity essential for its proper distribution and penetrating into the joints, while the brick should be thoroughly wetted on the surface. By these means the adhesion between them is rendered the more perfect, and the subsequent amount of shrinking and settlement is reduced to a minimum. The watery mortar, on the contrary, suffers extreme contraction, while the essential properties of the lime are actually dissipated, and when the wall becomes thoroughly dried, if ever it does, little remains in the way of cement but the sand compounded with it.—*The Northwestern Improvement Record.*

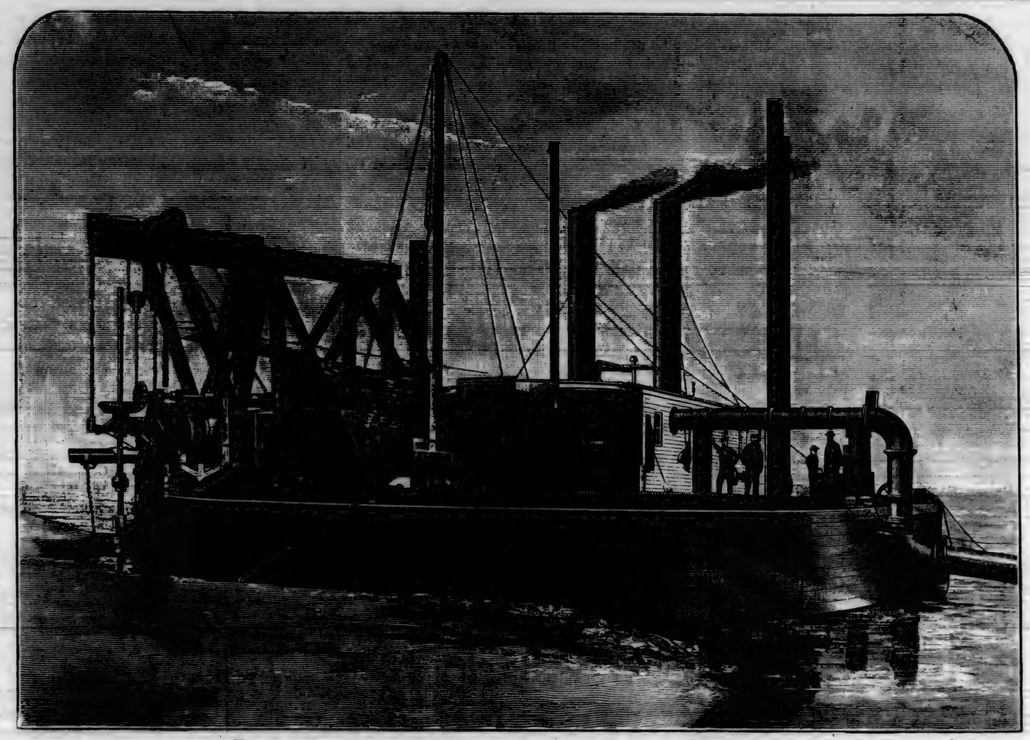

FIG. 1.—DREDGING APPARATUS AT OAKLAND HARBOR, CALIFORNIA.

Dredging at Oakland, Cal.

A PART of the extensive harbor improvements in progress at Oakland, near San Francisco, consist in the excavation of a tidal basin to improve the scour, at or near the harbor entrance. The material removed by the dredging operations is deposited in adjoining salt marshes, and retained there by means of embankments constructed along the shore line, so that a considerable area will be reclaimed. Fig. 2 shows the floating discharge pipe that carries away the mud. The dredging machines employed are, says *Engineering*, on the same principle as those used at the Grand Amsterdam Canal Works, that is to say, they belong to the type in which the material to be raised is first reduced by suitable machinery to a condition of mud, and then pumped to the surface, and delivered by means of a pipe line.

Fig. 1 illustrates the general form of the dredging machinery used at Oakland Harbor. The submerged and mixing part of the arrangement consists of a horizontal wheel with plowshares attached around the lower face. By means of steam power on the boat, rotation is given to this wheel, which is inclosed in a casing, so that water can enter only on the under side. On the top of this casing is fixed the rising main, twenty inches in diameter, of a centrifugal pump, six feet in diameter, placed on the boat. The delivery main of this

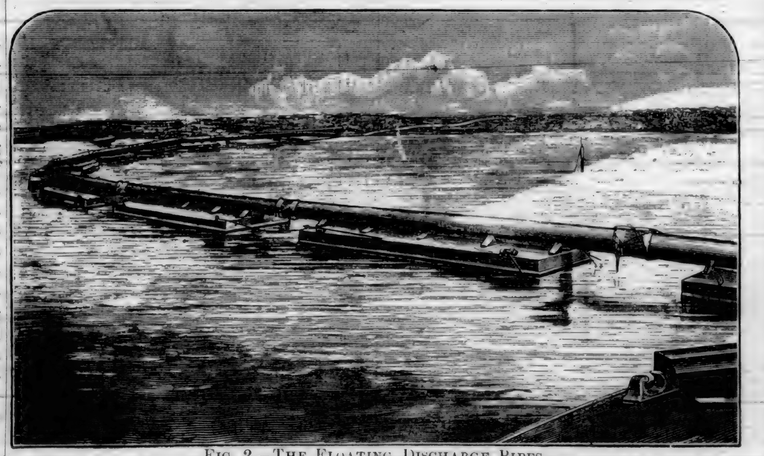

FIG. 2.—THE FLOATING DISCHARGE PIPES.

pump, also twenty inches in diameter, is extended from the vessel by a line of wrought iron pipe, with ball and socket joints and rubber connections; it is supported in position to the marsh where the mud is delivered. By this arrangement, which is shown clearly in the engravings, the material excavated, after being mixed, passes directly through the pump and delivery mains, and only comes to rest when it is discharged. As much as forty per cent. of solid matter can be carried in this way, but fifteen per cent. is found by experience to be the most convenient amount, one obvious advantage resulting from this dilution being that the solid material is more widely and uniformly distributed over the area to be reclaimed.

The pump is driven by a pair of engines having cylinders sixteen inches in diameter and twenty-inch stroke, and two other engines with cylinders twelve inches in diameter and twelve-inch stroke, drive the cutting and mixing gear, the winches, hoists, etc. Steam of ninety pounds to ninety-five pounds pressure is supplied by two one hundred horse-power boilers. The greatest length of delivery pipes employed has been 2,850 feet, and through this length 41,000 cubic yards of mud were delivered in 190 hours. During a period of eight months one of these machines raised and deposited 250,000 cubic yards, or an average of 30,000 yards per month. In one month of this period there were moved over 60,000 yards, through a distance of 1,100 feet. The total expense per day of ten hours of one of these machines, including interest, depreciation, and insurance, amounts to 100 dollars or about 20*l.*, and in connection with the work there are other expenses, as follows:—

1. The construction and maintenance of levees or embankments for confining the freshly dredged material. 2. The services of nine or ten men to guide the flow and distribution of the material as it is delivered. The cost of previous dredging operations on the Pacific Coast by ordinary appliances has averaged twenty-four cents, or one shilling per yard, while the maximum expense per yard, with the system we now describe, is a maximum of six cents, falling in some cases to five cents per yard. The Oakland Harbor dredging operations are under the control of Col. G. H. Mendell, of the United States Corps of Army Engineers.—*Scientific American.*

"Won't Finish up Other Men's Jobs."

THERE is both a good and a bad "rule" and "combination" in practice among mechanics in this city, in the matter of refusal to complete, or finish up work commenced by others under contract. The rule is correct and warrantable when intelligent and good business reasons exist for the delay or stoppage of the work, because of default in payments, or other equally just and substantial reasons. To "stand in together" and protect one another under such circumstances, is but just and right to the respective crafts generally, and the mechanic who would step in and virtually aid and assist defaulting or dishonest owners or contractors, by completing unfinished work not paid for, nor secured in doubtful cases, is not honorable, and should receive the *positive* disapproval of his craft, and of mechanics generally.

But the law of "just discrimination" should be evoked and practiced in all such cases, and the bars of mutual protection removed, when the default and wrong is altogether on the part of the craftsman. Every man has rights which should be respected, whether he be master or vassal, employer or employed; and it is injustice of the grossest kind for one who has it in his power, to exercise a mastery over another, simply because he can do so with impunity. It is cowardice that defies resistance from the helpless, and exultation over those who have been so unfortunate as to have committed the error of intrusting with innocent and right intent, work into unworthy hands, is diminutive.

The point and practice we are aiming at is this. It sometimes happens that original and sub-contracts are let to men who afterward develop characteristics, as individuals and mechanics, which should forever debar them from association and competition with qualified and good men. Such there are in all branches of mechanism, and it is unfortunate that the possibilities are not easy of access, by which they may be known and read of all men, other than that of severe experiences on the part of those who happen unwittingly to exercise mistaken confidence in them. But under the convention of mutual agreement among mechanics, the unfortunate employer of such parties, whether as owner or contractor, is powerless to shake off the mechanical incubus, as the "rule" forbids that any other should extend the relief of finishing up the work unreasonably long delayed or badly done by the first employed—no matter what the circumstances of the case may be, short of death itself. This is unjust in the extreme, and should be remedied; the better men should be equally prompt to redress wrongs practiced by their fellows, as they are to protect mutual interests.

A case in point: A well-known, practical stair-builder of acknowledged good qualifications, and comparative if not superlative large experience, entered into contract for the stair work in an $8,000 residence, which was being built by contract under a forfeiture of five dollars per day for over time. As soon as the architect was advised who the "stair man" was, he warned the building contractor that there would be trouble in getting the stair work completed in time, and it so happened. The stair work was delayed, and weeks rolled by, yet no stair man to be seen. The architect complained, and the contractor urged and re-urged almost daily, but still—*rails*, newels, and balusters not forthcoming. The house was painted, grained, and varnished as far as it could be, and still the stair work not in. The contractor endeavored to employ other stair builders, but the imperative *rule* of non-interference was the only answer received. Full-progress payment had been made, and the balance was secure, and yet no man could be found to complete the work, and, directly and indirectly, full six weeks passed beyond the time for completion of the building, because the stair-builder was neglectful, and no other would complete the stair work for love or money. And with sorrow we say it, that the derelict party spent at drinking, and was besottedly under the influence of whisky a much greater period of time than it would have required one man to have done all the stair work in question. Still the "rule" protected this abuse of the owner's and contractor's rights, and the man who loves his cups more than he does the faithful pursuit of an honorable trade, received his pay in full, because not bound by written contract to suffer liquidated damages for his default. The fully one and one-half months—forty-five days over time—could have been demanded and retained by the owner, from the contract sum, but it was not nor any part thereof, and he therefore suffered the loss of hotel bills for the period named, to a greater sum than the forfeit amount.

We claim that in any and all such and similar cases of failure on the part of first-contracting parties to perform the work undertaken, in a reasonably prompt and proper manner, the rule should be that any other party may, without violation of any principle of right, complete the unfinished work. Many like aggravating cases might be related, but this one is sufficient to illustrate the bad working aspect of a rule which certainly needs amendment in common practice.

Deceitful Builders.

THERE is seemingly no business carried on in the world where there is more fraud and dishonesty than in the building trades. All builders and contractors are not dishonest, but the number who are is legion. The chief aim of many of them seems to be to ascertain some plan for bringing in a bill for extras, or for evading the true intent of the contract by furnishing a different and poorer material than that stipulated in the specifications. It is a very difficult thing for a "green hand" at building to make a contract with a builder which will hold water. There is such a chance for ambiguity, and for concealments and omissions. Then, half of the parties do not know what is necessary to be done to insure a good building, and the honest carpenter is the last man to inform them. Go into court, and there will be seen case after case arising out of the attempt of some smart builder to palm off sham in the place of good work. There seems to be no way of avoiding this trouble unless one goes to a skilled and honest architect and places the matter wholly in his charge. Even then disputes and litigations frequently arise.

There is room for a radical reformation in the building trades. The cause of much of the dishonesty in these trades arises from the unscrupulous competition which there prevails. Bidders offer to take jobs at a loss, hoping to make up by scrimping and by obtaining payment for a liberal amount of "extras." It is difficult to point out a remedy for this evil. If one can find a builder who is known to be honest, it would be better to patronize him, even if his bid is a trifle higher than that of his competitors. Underbidding is the bane of the building trades. Cheap contracts usually mean cheap and deceitful work, and unsatisfactory results all around. It is pretty safe, too that no builder calculates to lose money on a job, and many of the gentlemen of the craft will get out from under a too low bid by means which will not bear the light of day.

All contractors for erecting buildings, as we have said, are not thus dishonest. Some, even, will go on to the end and faithfully perform their engagements when they know they will lose by so doing. Such men should be rewarded by good patronage, but unfortunately they do not always grow rich. The doctrine of the "survival of the fittest," we are sorry to say, does not always prove true in their case.—*Industrial World.*

Practical Graining.

THE subject of graining in imitation of oak, walnut, and other woods is a very interesting study for amateur painters. There is much to learn and it requires a steady perseverance to acquire even a superficial knowledge of the art. To those who wish to learn to grain, and have a taste for the work, a few suggestions may not be out of place here, for a little practice. In the first place it is necessary to know something of the ground-work or base for the different kinds of work; and it is useful for all to experiment with different shades to establish the tone that is necessary to produce a proper imitation of the various woods to be grained. For oak, the ground color is made of white lead, tinted with crome yellow and a little red, or yellow ochre alone; a light shade for light oak and a deeper one for dark oak. For walnut, various colors are used, white lead, yellow, a little amber, the yellow strong enough to keep it bright in tone and yet dark. Another color tinted with India red and yellow ocher in shade like sole-leather. This color gives a warm ground color and gives a pleasant effect to graining done over it. For mahogony, the color should be of a bright copper in tone, using Venetian red to tint with. A light straw color is used for laurel and a still lighter one for maple or ash. All these various colored grounds are put on in flat color, the paint having but little oil and more of turpentine, and when dry, sand-paper smooth and the ground-work is ready for the graining color. It is now in order to get the prepared colors at the paint stores, if they cannot befound, take burnt amber in oil, Sienna in oil red and some burnt Sienna, and mix them in two-thirds oil and one of turpentine. If the job of work to be done is small a very little of these colors is necessary, and put only a small quantity of the burnt Sienna in, and be sure and see that the color put into the oil and turpentine is only sufficient to color it lightly. It is customary to try a little on some part of the work to see that it is not too dark, for light oak requires but a very little color for general work.

The tools required for oak graining are a set of steel combs, one of rubber, and a sash tool, with a flat paint brush, some clean rags or cotton flannel. The rubber comb may be three or four inches long, 12 inches wide with one-half inch thick, the long edge to be notched with a knife into one-fourth inch teeth, and it is ready for use. Now everything is in order to commence graining, and as it is supposed to be the first effort, the panels of a door may be laid in with color or rubbed in, putting on only sufficient color to cover it evenly, and when set, having previously selected the style of work you wish to do, cover the thumb nail with the rag and wipe away.

The growth or sap is the work of the thumb nail, with a slight pressure of the ball sideways to give the sweeps, and the nail regulates the form and its contractions. After the wiping the growth, the comb is used to give it grain and complete the work of the panel. The lower panels may be champered to give variety, showing the oak lights in contrast to the heart growth. The latter can be retouched when dry with the checks or pores and shaded where knots or centers occur.

Growth or Heart.

Oak Lights or Panel.

When the graining is done it should look like the samples above. For styles, plain grain for the outside, the center ones a little sweep of the rubber to strengthen the combing, following the same curvature with the steel comb. The center rail, when the growth is in full on the panels above, may show a little heart work on its lower part, but if the panels are done in oak lights, the center rail should have a full heart growth wiped out clean, leaving only enough color at each sap length for shade. The lower rail is done with the rubber comb in a slight wave across its length and toned with a fine steel comb. The outer styles are sometimes touched with the rubber opposite the panels, in contrast with the oak lights of that part of the door. The shading is done with the same color, on the center of the heart growth and on the upper side of the curve of the rubber combing. The first is laid in a V shape at the point above and below the center. The color can be laid on with a small brush, and if you have a blender, you can soften the outer verges. The shade on the coarse rubber grain is laid on its full breath and softened with cloth or a blender, always on the center of curve in flashes not over an inch in width. In giving you this description of the work, you may gain the *ideal*, but the *real* is gained only by practice and observation which in fact is the great instructor. A tool for dappling out the oak lights, is made of bone in shape like the case-knife blade made sharp enough to take out the color. In use when dappling, the bone is wiped off after each application. In a future number we will give some practical hints on graining in walnut, mahogany, maple, ash, pitch pine, and so with color mixing for the various grounds for the imitation of these woods.

"Queen Anne" Style in Building.

A WRITER in the *American* thus fitly characterizes this so-called class of architecture:

"I have never been able to find any one who could lucidly define the new style, or formulate the principles that govern its designers. But no one will deny that there is a new influence at work in modern architecture, even if they cannot analyze it. The fact is that modern work defies classification, simply because its distinguishing characteristic is eclecticism. The selection of incongruous material from the older styles, and the attempt to weld them into homogeneity, are not likely to conserve the sterling principles of good design. Queen Anne has little significance as a name. Popular considerations have more to do with it than anything else. Among the better class of architects the name is held in derision as the work of those who ape foreign fashions Architecture is something more than a matter of fashion.

"The new movement, however, has a well-defined influence which has nothing to do with the appropriateness of its name. Its real significance is to be found not in its definite features as a style, but as showing how completely modern work has broken away from the spirit of the past and the principles of good design that formerly acted as a restraining influence. Up to a comparatively recent period architects have worked in, or under, the influence of schools of architecture; that is to say, certain styles were followed and developed at one time, and in which most architects made their designs. In France can be seen to-day an instance of a school of architecture deominated by the vigorous central influence of the *Ecole des Beaux-Arts*. With us, however, architects seek to be distinguished by the individuality of their word. The road to success lies through the tempting fields of eclecticism. In old times every man worked after his own method, but he kept the great principles of the style always in sight. There was to a certain extent a standard that might be appealed to, and by which the work could be judged. A controlling unity and fitness were acknowledged, but this did not prevent original conceptions. It was simply the restraint of law and order. As far as modern architecture has any tendency at all, I think thoughtful people must admit that it does not move in the direction above pointed out.

"There are few architects, even among our older men, who have not had their work affected by the fashionable demands of the day This is especially noticeable in the designs for country houses. It is admitted that the new style has been rather unproductive of sterling results in the more important secular and ecclesiastical work. Here its failure is striking. Logical principles are here lost sight of, and the rage for 'something new' has resulted in a radical chaos. The conservative reaction has not fully set in. Perhaps when it does something good may result."

Drawing and Shading. $1.25.

The Lick Free Baths.

AFTER a lapse of almost a decade, since the late James Lick bequeathed, and placed in charge of a board of trustees, the sum of $150-000 to be expended in providing free bathing for the masses, the time for action, judging from the report of the trustees, that "no legitimate obstacle exists to the erection of the baths," seems to have arrived. This admission places the board in front, to receive commendation and praise for prompt and wise action, or censure and reproaches for tardiness, delays, and mistakes as the case may be. They can no longer lie at ease within the casement of unsettled or unavailable means, as they have thrown open the doors and exposed the true condition of affairs within, and placed themselves in the position of exclusively responsible parties for all the unnecessary slowness and mistaken management of the future.

They may also rest assured, that however well they may direct and manage affairs there will be tongues and pens to express and write out, and journals to print and circulate statements which may or may not contain a single *whole sentence of exact truth*. For this they should be prepared, but not in that spirit of stoical indifference which too often characterize men under similar circumstances, in defying and disregarding the well meant suggestions and honestly expressed opinions and advice of others, whose interest and rights, and good judgment in the matter controlled, may be equal with those who by circumstance may be placed in a position of trust which would be better filled, and the interests and purposes confided better served by others of more enlarged and liberal views.

There are multitudes of things to be considered, and a large amount of excellent, practical judgment will be required. Chief and paramount to all others, is that of location. Individually we say, let it be as central as possible; as near the new City Hall as practical; as conveniently accessible by the greater number of street railroads as can be, without special favor to any.

SALT WATER BATHS.

This they should be by all means, as salt water in abundance can be introduced at any point within the city limits, at much less cost, lifting apparatus, conducting pipe, etc., considered, than an equal supply of Spring Valley water would cost. This matter of water supply is a very material one, as it must be in abundance to insure cleanliness and healthfulness. The supply must be furnished by Spring Valley, be pumped from artesian wells, drawn from the waters of the bay and brought into the city, or the baths must be located near or at some possible beach, a long, and to the poor, expensive distance from reasonably convenient accessibility to the great majority of those who will use the baths.

But as the whole matter is in the hands of men who are not lacking in intelligence and business experience, although they may never have built nor run a public bathing establishment, and may be novices in the details of such an institution, yet it is to be hoped that they will exercise as nearly faultless judgment as is possible, and consummate the completion of a bathing establishment which will be creditable to themselves every way, and fully respect the wishes, and do honor to the memory of the generous dead.

Tall Chimneys Are Dangerous.

IT is surprising that the powers that be, who supervise, and to a certain extent dictate under the law, how certain things shall be done in house construction, permit those tall, risky, and unsightly chimney tops which are to be seen protruding through the roof of so many of the "fantastic style" of buildings in San Francisco. That they are dangerous to life and limb needs no more than ordinary common sense to determine. There are many striking examples in various parts of the city, of tall, slender, disproportionate, heavy topped chimneys, which should be taken down to a reasonable height in brick, above which should the eratic designer wish to "pile on the agony," a metal top will serve all the purposes of his wildest fancies with greater safety. These high tops are dangerous affairs, particularly when not provided with flue linings of heavy iron. They are not safe even during ordinary "gusty" or "squally" winds, much less so during the winds which accompany severe storms, and most assuredly they are menaces to human life in times of earthquakes, from which California is by no means safe, even if the shaking forces which have so often stirred up things on this coast, and in this city, have taken a trip around the world, by way of the Eastern States, London, etc.

We may be answered by the guardians of safety, that there is no special ordinance limiting the height of chimney tops, and therefore the matter is beyond the control of the fire wardens. This may serve as an escape-from-responsibility argument, but it is not consistent. The same unwritten law of "safety" which is applied in other matters not ordinanced upon, may reasonably, with the same impunity, and with more reason and justice, be applied in cases of this kind, where men, without regard to consequences, pile up a ton or more of bricks above all support, likely to be toppled down upon the heads of people at any moment by the forces which have, and may at any moment, startle and affright the inhabitants of San Francisco. If a tumbling-down of these monstrosities—for such many of them are, without beauty or consistency—should do no greater damage than crack the skulls of those who caused them to be erected, there would be no loss of valuable human life—none that the architectural profession could not dispense with to advantage—and the entailment of reconstruction upon owners, who allow, and perhaps on account of their extreme oddness and peculiarities admire them, would be well deserved.

Stair Builders' Guide. $3.00.

Planking Yards, etc.

MR. EDITOR: In the general building specification, it is usually provided that yards and passage-ways at the rear and sides of buildings shall be planked with redwood planks, spiked to a certain size sleeper, spaced as may be directed. And now comes the part to which I refer in this article, and that is, that the redwood sleepers must be solidly bedded in the sand. Now is it not an outrage on the pocket of owners, to allow the sleepers carrying his yard planking to lay solidly bedded in sand, and to be covered on the top with the yard planking, and so allow those sleepers to receive the whole amount of decaying properties, through the dampness that naturally will collect under the planking, and permit them to rot in prematureness, as there is no way provided for ventilation, and not a particle of air circulation can be had, because every in and outlet is closed up, first, by the solid bedding under and on the sides of the sleepers, and, second, by the planking on top. Now I would suggest a mode of yard planking which is of long standing among practical men,—that redwood sleepers be lain to rest on rammed ground, distant between sleepers two feet; to be planked with one and one-half-inch rough redwood boards, spiked strong and secure to the sleepers; no earth, rubbish, or other materials whatever to be allowed between the sides of the sleepers, from the extend of under side of planks to under side of sleepers. You will observe that this will create a space between the sleepers, planking, and ground for a constant current of air to pass, and to dry the moisture collected, which, if the soil would be allowed to remain in the space where the air circulates now, it would hold the dampness and foster the rot of the timber.

M. P. SCHETZEL.

A MAN who is a thorough master of a trade carries his capital in his head. He is independent, and should be self-reliant, as his services will always be in requisition. Unless, perchance, he has drifted into some portion of the world where trade and manufactures are in a state of decadence. It may be an excellent thing to endow a youth with a splendid education, but often we find such young men failures in a business way. But there is no excuse for a first-class mechanic or engineer ever being found in such an unfortunate plight. The man possessing a good scientific or mechanical education who cannot make his way successfully through life must be composed of very poor material.—*The Builder and Wood-worker.*

Granolithic Paving.

ONE of the silver medals of the Mechanics' Institute was awarded to the Granolithic Paving Company. This was an exhibit which every one who visited the fair admired, and it is safe to predict that granolithic stonework will become immensely popular in San Francisco. Granolithic stone has for a number of years held the first place in Great Britain, and has been declared by experienced architects and contractors to equal in strength, durability, and appearance granite itself. It was first introduced into Great Britain and was registered at the patent offices of Europe and afterwards in the United States. It is composed of ground Scotch granite and a cement especially prepared for the purpose. The granite is reduced by rollers or crushers to irregular cubes which will pass through a half-inch mesh, and is entirely freed from dust or flour, so fatal to cement, by an air blast from a blower. The gradation of particles, from the size of a large pea down to the smallest sharp granite sand, with irregular faces and a small proportion of voids and interstices, furnishes a compact, interlaced mass, which offers the most favorable conditions for the cement doing its whole duty.

The office of W. S. Somervell, the manager, is at 422 Montgomery Street.

Artificial Stone.

THE California Artificial Stone Paving Company also won a silver medal for their display of paving flags, several of which have proved to the satisfaction of everybody the durability of this material by standing the wear and tear of time and constant usage for periods ranging from eight to ten years on our most populous thoroughfares. This company's stonework is by far more serviceable than granite, for, while there is a difference in the hardness of different blocks of granite and one will wear out more rapidly than another, this stone is perfectly uniform in that respect, and no one block can be found which shows any greater wear than another, so that pavements laid eight or ten years ago are as unworn to-day as when they were first put down. Another great advantage is that these blocks, while perfectly smooth, are never slippery, which is a matter of no small importance in a city having as many steep grades as San Francisco. The office of the company is at 404 Montgomery Street, and is under the efficient management of J. Goodman.

THE PAINTER'S FOREMAN.

A BOOK OF VALUABLE RECEIPTS.

It explains how to grain or imitate French Walnut that cannot be discounted; also Black Walnut, Oak, Ash, Chestnut Cherry, Satinwood, Bird's Eye, and Curly Maple; and the different woods that are imitated by graining. It gives you a sample color of the different kinds of background used to imitate the different kinds of wood, how to mix and what colors to use to make them, and how to apply them from the first coat to the last.

The graining department is explained so clearly and fully that by following the directions any one can do a first-class job of graining. It also explains how to do different kinds of Fresco work, what colors to use, how to mix and apply them. How to grain or imitate the different marbles, what colors to use, how to mix and apply them. How to make the different kinds of wood fillers, the different kinds of oil finish, the different kinds of polishes. How to gild letters on wood. How to make and use smalt. How to paint banners, etc. How to gild on japan, tin signs. How to make changeable signs that will read three different ways on same board. How to letter glass signs. How to do pearl work. How to gild on glass. How to color glass. How to ebonize wood. How to make paint for school blackboards, etc., etc.

In fact, it is the only work published that explains fully and clearly the different secrets of the painting art.

Price, by mail, post-paid $2.00.

Address. F. C. SHEPARD,

TERMS:

PER ANNUM $2.00 IN ADVANCE

ENTERED AT POST-OFFICE AS SECOND CLASS MATTER.

ADVERTISING RATES.

Front Cover, outside, each insertion, $2.50 per square.
Back Cover, outside, each insertion, $2.00 per square.
Page preceding reading matter, $1.75 per square.
Page following reading matter, $1.50 per square,
Inside Pages, each insertion, $1.00 per square.
Full Page, inside, one insertion, $40.00.
Each subsequent insertion according to agreement.

A square is seven-eighths of an inch in length by width of column.

Advertisements alone inserted that refer to materials used in the construction and furnishing of houses, and to matters and trades belonging to the building interest.

NO OTHERS RECEIVED.

Advertisements inserted for three months or less are payable in advance; payable quarterly when inserted for a longer period.

When money is sent for subscriptions, the receipt of a copy of this journal is an acknowledgment that it has been received. Unless requested we do not send receipts.

Building Prosperities.

To a certain extent, the low prices obtainable for lumber and hardware have stimulated owners to improve their property. There can be but one real cause, however, for the steady movement in building improvements, and that is, *a thorough confidence by our business men in the future of San Francisco, and a gradual advancement of her manufacturing interests.*

Last year, at this time, there was a general good feeling on the part of most of the population, on account of work being plenty, crops abundant, and times generally very good. This year there has been a universal complaint of hard times and scarcity of money among our business men, and yet we find that in our October issue, 1883, there were reported but **thirty-five buildings of value of $166,600**, while in our building intelligence for the corresponding period of the present year, we find **ninety-five of the value of $441,850**. The difference in the two amounts is sufficient to keep quite a large number of men at work.

Mechanics are in fair demand in city, with but a limited call for the same in country. We notice an increasing disposition on the part of contractors and others to offer lower wages, and, when possible, to demand ten hours for a day's work.

The price of bricks is still kept up. Masons' wages remain the same. Lath are very scarce, and command full prices. Hardware, abundant and cheap. Contractors are figuring very low, and the margin left for themselves is entirely too small for the risks incurred. Stock of lumber on hand in our yards is being reduced. Present prices of that material cannot longer be sustained, as it is actually being sold at a loss. Some remedy will soon be found for this difficulty, and then the price will be set at a figure to reimburse those now sustaining losses.

On the whole, as far as the city is concerned, an active winter's season is assured to all branches of the building trades.

Excavating for Cellars—Coterminous Rights.

WHEN the decision of the Superior Court of this State was rendered in the case of Aston, Respondent, vs. Nolan, Appellant, it was, at first glance, accepted and presumed to be a final and conclusive determination of the rights of coterminous owners in the matter of excavating for cellars, and supporting and underpinning adjacent structures. The decision clearly indicates that every owner of land has the right to enjoy the use of his property, in excavating to a proper depth—the depth being established by city ordinance at fourteen feet—for purposes of construction, imposing no other duty upon the one making the excavation than the exercise of proper care and caution in the prosecution of the work, and the service of proper notice upon the coterminous owner, thus placing the responsibility and cost of underpinning just where it should be, upon the owners of structures on lots adjoining such excavations. This is the plain letter, spirit, and intent of the decision—is right and proper as a legal proposition, and altogether just and correct in point of equity; and had not the learned judge gone beyond the facts of the case in review, and given expression to an opinion upon a point not in issue, the question of coterminous owners' rights would have been clear and well defined; for the language of the reviewing, and of each of the concurring judges, is sufficiently plain not to admit of misconception, that owners have a right to excavate their lots for the purpose of construction, subject to proper notification, care, etc., except so far as Judge McKinstry's volunteer opinion may intervene, which reads: "It may be added, if the building has stood for a period of five years (in this State), before the excavation, the person who erected it has acquired a specia of easement in his neighbor's land—a right to the support of his buildings as well as soil. No such question as this last is presented in the case before us."

This volunteer, outside opinion, not decision—for, as the learned Judge says, there was no such question before the Court—gives to owners of old shanties, dilapidated structures, and valueless buildings of whatever sort, a decided and special advantage over those who are so unfortunate as not to have on their lot constructions whose history extends back five years or more.

Why five, or any other number of years should give to one owner of adjacent property more than to another, "easements," or "prescriptive rights" in the property of others, is by no means transparent to those who are blessed with no more than ordinary, fair business common sense, and judgments unwarped by legal logic and training. Nor is it by any means clear to the same class of minds, why any one, at any time, or under any circumstances, should gain or acquire rights, or control of positive, conditional, contingent, easemental, or any other character in or over the property of another, short of paying the coin for the same, or giving other valuable considerations.

This fact everybody understands, that innumerable issues are, from time to time, determined *according to law*, which, in point of justice and fair equity, have assumed the char-

acter of positive outrages, so much so that the law-making powers have been, and from time to time will be called upon to change, modify, or entirely annul preceding enactments, which have been found to work hardships and injustice. All laws are presumed to be constructed upon the basis of equity and justice, but so long as they are of human origin, just so long will they be subject to human imperfections. Of this, however, for the present, owners and architects may rest assured, that in making excavations for cellars or other purposes, the party excavating is required, under the extra judicial edict of the Supreme Court in the case mentioned, to sustain and underpin all old, worthless, or other constructions on adjacent property, which has stood for five years or more; and by the decision proper, all adjacent owners whose improvements have not been in existence five years, are required to sustain and underpin their buildings.

No Cause for Owners or Builders to Rejoice When Lumber is Sold Below the Cost of Production.

ALTHOUGH the present price of lumber may be a boon to those building in the city, it is anything but agreeable to the wage workers in the lumbering districts. The rate at which lumber can be purchased, simply means a shutting down of the mills, or a decreased rate of wages; and as it is a well-known fact that a lumber mill deteriorates much more rapidly when idle than when it is in active operation, it follows that *low wages* will be the rule during the winter operations in the lumber regions, as the mills must be run part of the time in order to save the machinery from rusting, etc.

As explained in a previous article, over-production has been the cause of the break in the market; or, rather, to be a little more particular, non-consumption of the manufactured article, principally caused by the absence of a foreign demand, the latter item being the reason for the large quantity of lumber stored in the "Lumber Bone Yard."

It may be well to inquire what would be a fair rate for lumber, and yet leave a proper margin in first hands to cover extraordinary expenses. The price on the late schedule was $22.50 per M. for rough. During the past week, we have heard of sales as low as $13.00; while the former price is too high, the latter is decidedly too low. For although the latter may be of temporary benefit to those now building, or those able to lay in large stocks for speculation, in the end it will be found to work disadvantageously all around. There is, however, a fair profit all around at $18.00 per M., and all over that price is but adding to the coffers of those who now have more money than they will ever need for the reasonable purposes of life.

It is almost impossible to name a price at which lumber can be sold the year around. The wage workers are in a measure responsible for this; the filling of unusual large orders, necessitates additional help; and when the latter observe that there really is lots of work ahead, they consider it a good time to *strike*, and so demand increased wages. The manufacturers, of course, add enough to the price to cover this increased expense, and thus the market becomes a battledore and shuttlecock.

This can only be remedied when men can be found who are willing to work by the year for a stated sum per month, taking the dull and brisk season into full consideration. Take a year's work under the present system; a common hand around a mill will get eight months' steady work at $40.00 and board. Two months he will not obtain over $30.00, and two months idle; during the latter period he will have to pay his board out of his previous earnings, say $16.00 per month. So $340 would be the full sum of his earnings. Suppose the same man should say to the owner, I will agree to stay one year for $30.00 per month and board, and no lost time. He would have at the end of the year $360, or $20.00 more than by holding out for higher wages and temporary work.

We are not advocating by any means the rate mentioned; we use the figures given simply for comparison, to show that steady work is much preferable to occasional jobs. We are well aware that when lumber is selling at a high rate, it is not the wage workers that receive the benefit. True, they receive a slight advance, but nothing commensurate to the profit enjoyed by the manufacturers themselves.

Not only is it a sign of bad times in the lumber regions when the price is "way down," but the same thing is evident in every other trade, when the price of any particular commodity is below its normal condition. At present prices of hardware, the profits are so small that of necessity the manufacturers do not produce any more than is actually required, thus only calling into use a fraction of the great army of wage workers in that line. The same may be said of every other calling. Over-production or under-consumption of any line of goods leads to the same result. It is evident, therefore, that extreme low prices of any commodity, result in the end to the disadvantage of those who really require the most help.

San Francisco Chapter American Institute of Architects.

THE meeting of the Chapter was held on Oct. 3d. It being the first meeting since the election of officers, more than usual interest was taken by the members, and, as a consequence, a larger number were present than at any meeting since the installation of officers the preceding year. The President, A. Laver, occupied the chair.

The usual routine business was proceeded with. Proposition received from J. Laver as a student member. H. Geilfuss was elected a member as Fellow.

The President then read his acceptance of the office to which he had been elected. It was as follows:—

FELLOWS, ASSOCIATES, AND MEMBERS OF THE S. F. CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS: It is no ordinary meeting of the S. F. Chapter of Architects which I have now the honor of addressing; and with better health, trust that you will find me less remiss in my duties to the Chapter in the future than in the past.

You have placed me in the highest position, and to be connected with this meeting is not only to me a great honor, but also a great responsibility in one respect especially. I feel that the Association might have done well to have chosen another President. I cannot but congratulate you on the able administration of affairs by the past President and the other officers of the Chapter. Under their *regimé* our Association has prospered and largely increased in numbers—the benefit growing out of the various schools of art and design for the advancement of the student, which have been established by them, should not be underestimated, in view of the great interests which cannot be withheld from the great future of San Francisco—the vast harbor with its defensible entrance which we possess, in which all the navies of the world can ride in safety, and toward which commerce seems to be gravitating, will make this city the equal in wealth and population to any city of the world. This, however, will perhaps not be for many centuries; knowing these probabilities, is it not well to lay the foundation for the architecture of the city worthy of its founders, and bring up our students in art to be equal to the great architectural future of San Francisco. Fellows and Members, it gives me pleasure to accept the position of President of the Chapter. I trust in your cordial support, and hope you will overlook my possible shortcomings. It is my fervent desire that good counsels, together with harmony and good feeling, will at all times prevail.

I now thank you warmly for the high compliment you have conferred on me by placing me in the chair. AUGUSTUS LAVER.

The committee in regard to the revision of the Fire Ordinances reported that they had received copies of the Ordinances of several different Eastern cities. During the coming week several more were expected. Upon receipt of these, the committee would be in a position to make comparisons with the older cities. Further time was allowed the committee to report.

Mr. G. H. Sanders then read an instructive paper on "Urban Improvements." It was ordered printed in full in the CALIFORNIA ARCHITECT. (It will be found on another page.) Adjourned.

Ingenious Idea.

IT is told of a man living away down in the Nutmeg State, that he wanted to put a water pipe through a drain several feet below the surface of the ground, without digging up the drain. To accomplish it, he tied a string to a cat's leg, thrust her into one end of the drain, and giving a terrific "scat," the feline quickly appeared at the other end; the pipe was drawn through the drain by means of the string, thus saving considerable expense.

FRONT ELEVATION OF $5,000 COUNTRY DWELLING.—3D PREMIUM DESIGN.

Our Third Prize Plan.

IN this issue we present the third of the series of prize plans. The author is W. Claude Frederick, 65 West Fayette St., Baltimore, Md.

The arrangement of the rooms is most certainly a novel one. The entrance hall is unusually large. It seems to have been the idea of the designer, to convert the larger portion of the first floor into one grand promenade, as he has omitted doors between the hall and the principal rooms connected therewith. We doubt the expediency of an open doorway in the dining-room, exposing those at the table to the gaze of all who may enter the front door. In California, even with its mild climate, fires would of necessity have to be kept in the fire-places most of the time, in order for the occupants to feel comfortable.

The conveniences attached to the kitchen are neatly arranged, the principal objection being the small size of that room.

The arrangement of the second floor is much more in keeping with our ideas on this coast. Abundance of closet room is especially noticeable. There is, however, an utter lack of stationery wash-bowls. One only is provided in the bath-room. It is almost inconceivable to us on this coast, that a house of this size should be unprovided with those most necessary appendages. It most certainly would cause a great deal of labor for a servant to carry all the refuse water down to the yard, as she must needs do, no hopper being shown in either story.

In the basement are located the laundry, vegetable cellar, wine cellar, fuel room, and furnace. In the attic are three servant's rooms, trunk room, and a billiard room.

We regret that the various estimates for the different work connected with the design, have been misplaced. The amount as furnished us by the architect is $4,889. To this should be added 5 per cent. for architect's fees, making total cost $5,114. We are assured by the designer that the house can be built as per plans, for the sum mentioned, in the vicinity of Baltimore.

A LITTLE chloride of lime dissolved in warm water left in a lamp or a can which has held kerosene will deodorize it very soon.

The Way That Houses Are Ordered and Planned.

WHEN a woman goes to a dry goods store to order the materials for a dress, she has usually something like a definite idea of the kind, color, quality, and quantity of the stuff and trimmings needed; but whether a man, or a married couple, or a woman give the order for a house, one and all have usually but a very undefined notion of the size or number of the rooms, of the quality and quantity of the materials, or of "trimmings," external or internal, that they require. All these things are left to the interpretation of the architect, if he is called upon, but, if not, to that of the builder, who, for the occasion, is compelled to do an architect's work. Under these circumstances it is no marvel that the plans have to pass through three or four editions, to the great dissatisfaction of both architect and client; for though it is doubtless the province of the architect to provide for all the needs of the plan and for the details of construction and ornament, it is yet impossible that he can make the size and arrangement of the rooms to suit, unless the client has definite ideas upon the matter, and is capable of explaining them. Few persons have clear conceptions of size. How large a room 16 feet by 12 is they have no idea. When the length and width are measured off for them upon the floor of a large office, they think the dimensions awfully small, and make them 20 by 15. This does very well on paper, but when the estimates come in, there is wailing and gnashing of teeth, and the design has to be submitted to the process often called "boiling down."

A design for a house is usually made something in this wise: A man suddenly makes up his mind that he will have a house built. He has waited until the last moment for his decision, and rushes to the knight of the T-square with the request that he will at once get out the plans and specifications for a house to cost so many thousand dollars. Perhaps he wants it like So-and-So's house, and, occasionally, he has a wish for a bay window to one of the parlors, or for two communicating bedrooms. He wants to see the drawings in a day or two, and to commence work in two weeks or less. The architect—who is generally, in these progressive and mechanical days, neither an artist in general nor a student of architecture in particular, but simply a man with considerable tact, and knowledge of men, and with an extensive aquaintance among moneyed men and speculators on the one hand and among practical builders and artisans on the other—has been through the operation so often that he has become case-hardened, and simply orders one of his assistants, probably the youngest, to make a copy, with variations, of a plan that has been used before. This is done, the sketch is submitted, alterations are made, and finally all is ready. The architect puts as little thought and labor into it as possible. In matters of construction, sewerage, ventilation, etc., he follows the exact routine to which he is accustomed, and in ornament and finish he sticks to his own stock patterns to save time. Except in a few points of arrangement, which are evolved in consultation with the client, the house is as like a hundred others turned out by the same firm as though it were made by a machine. Some architects do better than this—think, plan, design, try to perfect sanitation, construction, ventilation, ornament, etc.; but such architects remain poor. They are voted slow and behind the age, get no work to do, and are usually considered fools for their pains. The same general truth holds good for houses and architects, medical practice and doctors, congressmen and government, namely, the general public that needs houses, medicine, and government, must itself know more about house building, physiology, and social science before it can expect to be served by better architects, better doctors, or a better set of law-makers.—*Sel.*

Fire in Hay Lofts.

THE *Scientific American* makes a suggestion as to the cause of the frequent burning of barns, which deserves the attention of architects. As an illustration of its theory it relates a story of a workman who, while helping to get in some hay which had been gathered in cocks and protected with caps the night before, remarked that the hay was warm. Another man suggested that it might be hot enough to light a match, and the first, to satisfy himself, dropped an unlighted match into a rick near by. In five minutes the rick was in a blaze. If hay stacked in an open meadow will set fire to a match, the *Scientific American* thinks that when packed in masses in a close loft it may heat so much as to kindle the more combustible particles, and burn itself, with the building containing it. Any one can satisfy himself of the effect of fermentation in raising the temperature of leaves or other vegetable substances by looking at a thermometer plunged in a fresh hot-bed, or by thrusting his hand into a heap of moist leaves, or fresh-cut grass, or even tan bark. In the former case he will often see the mercury far above one hundred degrees Fahrenheit, while the hand will sometimes detect a heat in the interior of the mass which it cannot bear without some discomfort. The larger the mass, and the more closely it is packed, the higher will be the heat, and where the air is prevented from circulating, the constant addition of heat may bring it to the point of charring the woody particles. Once at this stage, the sudden admission of air would probably set the charred material into a blaze. The best way of avoiding this danger is to provide thorough ventilation for hay-lofts. With free access of air, not only is the fermentation of the imperfectly cured hay checked, and a part of it thus saved from spoiling, but the heat is carried away before it becomes intense enough to do harm.

A HINT FOR TAX DODGERS.—In Mianus, Conn., there is a house built twenty-five years ago by a man named Van Nostrand, who has lived in it all these years without removing the scaffolding that was used in its erection. Only part of the rooms are finished, and it is said that the house was left in that condition to escape the payment of taxes.

TO WRITE upon terra cotta tablets, dip the clay tablet into milk with a few drops of acid added, and then dry. When this is done, you can write upon it as easily as upon paper.

FLATS,
Their Disadvantages and Conveniences.

MANY have been surprised at the large number of "flats" erected in this city during the past three years. At first the impression seemed to be among those whose business it was to study the wants of the people and provide accordingly, that the "flat" system of building was an erroneous one, and in a short time would be relegated to the obscurity of the past; they did not comprehend that in this system there would be found a solution of a difficulty, the solving of which has occupied the attention of American housekeepers for years. The one great question has been, how best to combine the comforts of a home, and all the privacy and freedom thereby implied, with the smallest degree of expense, and the least household cares.

That this question has been answered satisfactorily, is proven by the large number of flats already erected, and in process of construction. We propose, however, to present a few of the drawbacks, as well as the advantages of the system under consideration.

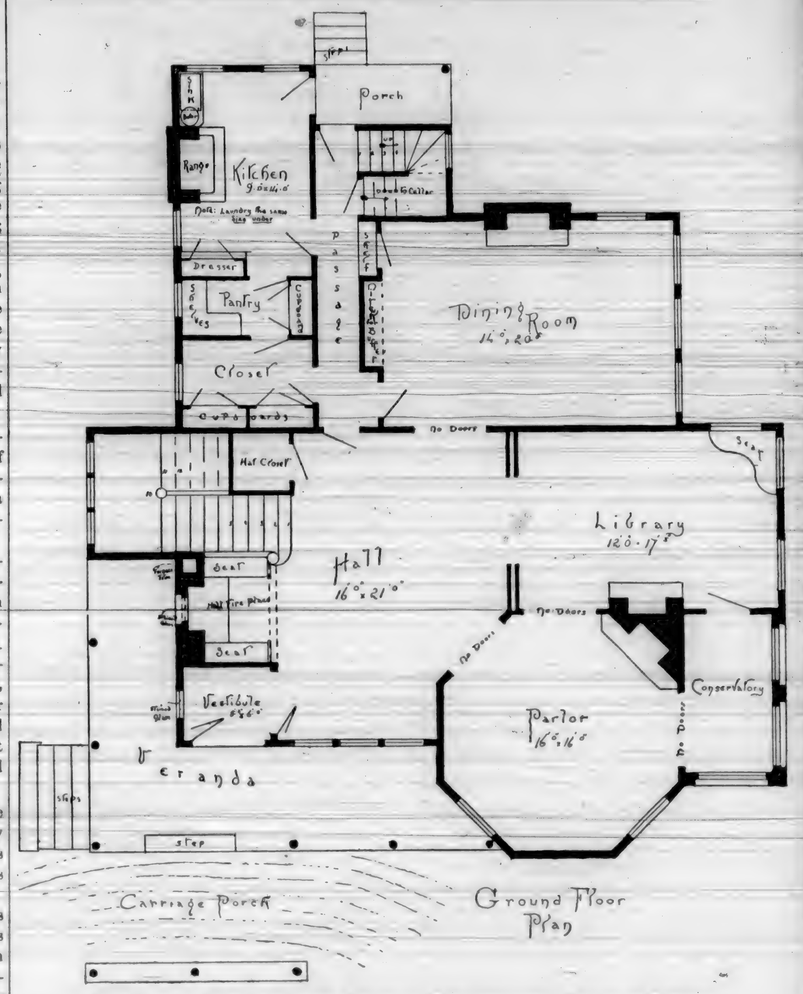
In the first place, there is always the impression—if you are a person of sensitive feeling—that you will annoy the people down stairs; and this impression is greatly heightened if you are lucky enough to possess several children. California children are proverbially healthy, and when they romp and play, no thought is given as to that which is over their head, or under their feet beneath; and so the delicate (?) tramping of the little feet may cause folks down-stairs to wish flats had never been thought of.

Again, it may be that you yourselves are quiet and the tenants above are the noisy ones. If so, you have a chance to see how it is for yourself, and endeavor to keep as quiet as possible for the comfort of those below.

Many complain that the servants in flats are too handy and just in the way; one does not, you know, feel free when a servant is in the next room, and liable to overhear your conversation. To this objection we will say right here, that the class of buildings referred to, are not for people able to keep servants. They are intended as a home for families, and, as a rule, but little provision is made for a room for any one outside of the family; a *spare* room is not to be thought of.

One of the most serious objections is the lack of yard room. This is especially felt when one is blessed with children. Probably much more confusion is caused by the noise from play in the yard than from any other cause. Generally the yards are covered with tongue and grooved flooring. Where there are three of these over each other, the lower tenants suffer at times more than their share from the noise.

Much of the inconvenience from this cause can be overcome by adopting a similar plan to that used inside, viz., *deafening*. The timbers supporting the different yards should be heavier to allow of the extra weight necessary for deafening to be used.



FIRST STORY PLAN OF $5,000 COUNTRY DWELLING.—3d PREMIUM DESIGN.

Another great advantage of flats is the inducement offered to young people by the knowledge of cheap rents, to get married. The first thought of every newly married couple should be to own a home. While saving their earnings for this object, nothing is more conducive to a general understanding of the ways of this world, than to keep house; by this means they learn to be frugal and to purchase only what they *need*, and not that which they may *desire*. Flats, from the cheap rent for which they can be had, give every young couple a chance to start immediately in their own cosy home.

Flats also give to many a chance to gratify their taste for *show*. Landlords have taken this freak of tenants into consideration. The outside appearance of the house is made very ornamental; the interior, with the exception possibly of the parlor, is left with very plain finishes; using the latter reduces the cost of the building and thus cheaper rents are secured.

Taking all the disadvantages and conveniences into consideration, we think that the system referred to is one that meets the approbation of a majority of those whose means are not sufficient to have a house all to themselves.

IN putting up your screen doors and windows be very particular to have a little hole in one corner so that the flies can go outdoors when they get tired of being inside.

Various and Sundry Conundrums.

To the Editor of the Builder: One of our Chinese students, after visiting a young ladies' seminary in New England, expressed his opinion of the institution by the remark, "Too much plenty girls." My sister house-keepers may not believe it, but I have too much plenty of another good thing—to wit, closets. To tell the truth, I don't so much object to the closets themselves as to the doors. What can I do with all the doors? A. B.

Richfield, Conn.

A very good way to manage obtrusive closet doors is to take them off and send them to the auction room or give them to the poor, substituting portieres. These will not give so much protection against burglars, moths, dust, inquisitive servants, and other troublesome insects as a good, stout door, well padlocked; but if you have several closets, one or two can doubtless be treated in this way to hold those things which are least valuable or tempting. Another can be disposed of by fitting the lower part with drawers, the face of the drawers forming a neat finish, with open shelves above for books or bottles. When two closets for one room stand adjacent to each other, it is sometimes practicable to make a small lobby between the two, with a door opening to the closet at either side, thus keeping the two separate closets, but having but one direct opening into the chamber.

Sliding doors are usually convenient for closets, because, as few, it is greatly to be feared, make a practice of entering their closets and shutting the door, there is not the ordinary objection to them in closing after passing through, and they are not half so troublesome or dangerous as the ordinary swinging sort.

Dear Sir: How can we manage the outside blinds on our wide, *very wide*, windows? The blinds sag when they are open so they will scarcely shut. The fastenings are so far around outside that I am in fear of breaking my neck when I try to reach them, and if a gust of wind happens to catch them, it would take a sailor to bring them into place. We *must* have outside blinds, and we *can't* give up the wide windows. MRS. E. K.

Manchester, N. H.

So far as crawling out the window to reach the fastenings is concerned, this is unnecessary, for there are fastenings that can be operated close by the hinge, and even inside the house, without opening the window at all. Of course they will sag, all things earthly sag unless well supported, and wide blinds should have something firm to rest upon, to keep them in a strong, upright position, both when open and shut.

The sail they carry is inevitable, and in a country of furious winds there is no protection against disaster from this cause but caution. There are outside rolling shutters, which would not be exposed to this peril, but they may have other serious defects, and are always expensive. We have seen outside blinds contrived to slide sidewise on a slender track, and this arrangement obviates the essential difficulties referred to. They can neither sag nor slam, and can be reached without leaning around the corner of the window sill to a dangerous extent. Of course, the tracks and guards will show, but that is not an unpardonable sin in a thing which is really useful.

WE are in a quandary about the front door. The houses in our village are "all in a row" along the one street that runs east and west. We live on the north side, consequently the house faces south; the lot is not very wide, and we hate to give up any part of the south side for a front door and hall. What can we do?

South Windham. H. M. G.

Whatever else you do, don't give up the sunny south side to the formal entrance hall—always uncomfortable and rarely used. Either make the front entrance at one side, leaving the whole of the south front for rooms for daily use, or else make a hall in one corner large enough to be used as a sitting-room. There is no law requiring your main entrance to face the sidewalk squarely except the law of fashion, and the more frequently and courageously you break this law, the greater will be your reward. Whether the entrance shall be on the east or the west side, the sitting-room hall in the southwest or the southeast corner, will depend, of course, upon the approaches and surroundings.

OUR chamber has three large windows, which is all right, *only* they are so placed that if there happens to be a breeze and the windows are open, the bed is directly in a draft. Perhaps this doesn't concern building, but I think if the house had been properly planned in the first place, it might have been avoided. Can anything be done to remedy the evil and still leave us the open windows? A. R.

Lowell.

Doubtless it is a question of house-keeping rather than house-building; still, as the fault is ascribed to the house, it is not amiss to ask for suggestions. People have been known to turn their beds around during the summer months, so that the high head-boards would turn aside the currents of air; but we think the simplest, prettiest plan is to have one or two light folding screens, say five feet high and five or six wide when fully open, that can easily be placed where they will do the most good—that is, where they will intercept the

"Blasts of evening air
That take our health away;"

And, what is more agreeable to some of us, ward off the too bright rays of the early morning sun when we desire a little more folding of the hands to sleep.

OUR dining-room would be quite satisfactory if it were not for a very ugly notch which is taken out of it by the back stairs. We want precisely the space they occupy for a sideboard. Without seeing the house, can you suggest any way of disposing of them?

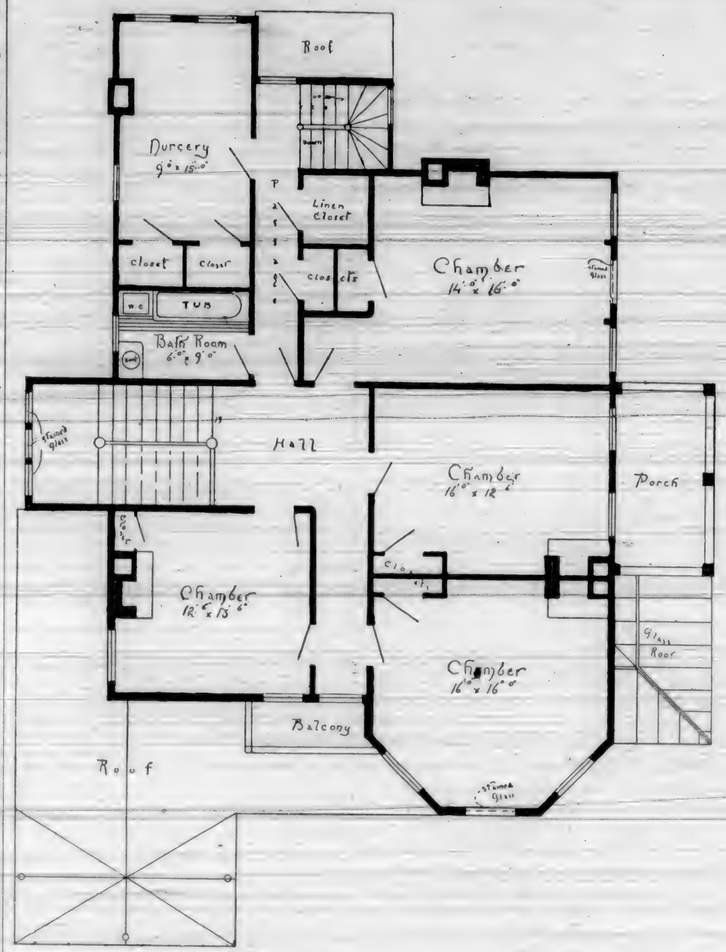
Lennox. M. C. D.

No we can't, and should not attempt any reply whatever, but for the opportunity afforded of saying in a general way that housekeepers, as a class, suffer untold martyrdom by means of their back stairs. They (the stairs, not the housekeepers) are very apt to be, as evidently in the present case, just where they ought not to be, and just what they ought not to be—steep, dark, narrow, crooked, dangerous, and, withal, used continually, both by the servants and the mistress. In some cases it would be wise to destroy them, root and branch, compelling the household to use the revered front stairs, which are, presumably at least, safe. Another expedient, not often adopted but nearly always practicable, is to make an addition outside the main walls, in cold blood, boldly, in defiance of Mrs. Grundy and all the builders, that shall contain a good, strong, easy, and well lighted staircase—that, and nothing more. This will not only be found more convenient, but very likely more economical than the making over or readjusting a flight entirely within the house.—*The Builder.*

The Enriched Grained Varieties of Redwood.

IT was not until many millions of feet of the more richly grained redwood of California had been recklessly and thoughtlessly consumed for general purposes, that special attention was attracted to the fact that a considerable percentage of redwood lumber possessed characteristics of great beauty and inherent qualities as to shrinkage and in other particulars, which entitle it to favorable consideration among the ornamental wood of the United States, for manufacturing and house finishing purpo e During the earlier periods, and until more recent years, the rich, curly "bird's eye," and other peculiarly marked species were cut for "rough lumber." The softer, straight grained kinds being so much more "easy to work," less liable to shrink endwise, and not so liable to split in nailing, became the favorite material for building and other purposes for which redwood was used, to the exclusion of the waivy and peculiarly grained varieties from the list of first-class redwood. Consequently, trees, or logs indicating the very features, which of late has given prominence to California redwood, were cut into plank, scantling, and dimension lumber, where size and strength were specially required; and millions of feet of choice grained wood have been split into railroad ties, and cut up for firewood, and otherwise destroyed, which, if to-day was available in board lumber, and on the market, would command a largely advanced price over and above present merchantable, first-class redwood.

The redwood forests of California have yielded some most beautiful specimens of tree growth, which, for richness and peculiarity of grain, is excelled only by the finest of costly hard wood. The peculiarity of shrinkage endwise is, perhaps, special to this wood, but does not extend beyond thorough seasoning, which perfects itself much more rapidly than in California sugar, or Eastern States pine. The value of the one discarded kind of redwood for manufacturing and finishing purposes has greatly increased during the past few years, and the present demand is greater than the supply of the "handsome variety," even for home consumption. Consequently, manufacturers of redwood lumber are paying attention to this fact, and will in the future regard with special interest such trees as will produce the rich grained article.



SECOND STORY PLAN OF $5,000 COUNTRY DWELLING.—3d PREMIUM DESIGN.

Something for Nothing.

THE desire to get something for nothing seems to be inborn in human nature. In general, people count themselves fortunate if they get an entirely satisfactory equivalent for an expenditure of time, labor, or money. Few, however, are averse to receiving benefits without rendering an equivalent. Newspaper publishers long since discovered this tendency of human nature, and are reminded of it often enough to keep it from passing out of memory. These gentle reminders seldom come in requests for gratuitous space in the regular advertising columns, although such instances are not unknown. The editorial columns are good enough for people who are willing to accept gratuitous advertising. This class of people always have something which they feel sure the public and ourselves must be interested in, and as a matter of news, you know, etc. Now, no persons in the world are so eager to get hold of news, something good, which they can appropriately use, as newspaper men. None have so keen an appreciation of what "the public" will be interested in as they. But there is a very wide margin between what would interest the party concerned and what would command the attention of the public, which has no personal interest in the matter. The obligation of the newspaper publisher is honestly discharged when he has given a certain amount of space in his advertising columns in return for a stipulated consideration. But, as a matter of fact, publishers are exceedingly liberal in their notices, reports, news items, etc., which call the attention of readers to persons or products. These notices, while they are of value to the business of the persons or firms mentioned, are gratuitously published because they are of interest to the public, and are a part of the history or record of the progress of trade. No class of business men in the world render so much service to business interests without asking or expecting direct return as newspaper publishers. Such being the fact, it is not strange that they should sometimes feel that good nature is trespassed upon when people who rarely or never do legitimate advertising go too far in their efforts to secure something for nothing.—*Amer. Artisan.*

Steel Square and Its Uses. $1.00.

Urban Architecture.

BY G. H SANDERS.*

SAN FRANCISCO, whether viewed from a distance, or seen from within, cannot be called, by even its most ardent admirer, an attractive city. Covering the lower ground and creeping over the hill-tops like a lichenous growth, it presents to the eye of the observer no single feature of beauty or of grace; nothing to excite the imagination or please the taste. Surrounded on all sides by lovely stretches of flashing blue water, the undulating lines of still bluer mountains, and overspread by the canopy of our glorious blue sky—beauty everywhere, by night and by day—the city itself presents to the disappointed spectator the barren desolation of a dry, verdureless waste! A closer inspection only adds to the dissatisfaction of the beholder. The general condition of the roads and sidewalks and other necessary evidences of a prosperous community may be truly said to be indescribable! While the city is not wanting in many structures of real architectural merit, they are so handicapped and disgraced by their immediate surroundings as to leave upon the mind only a general impression of dilapidation and disrepair!

Not a single street in the city can be said to afford to the pedestrian a continuously agreeable walk. Scarcely a street in the city possesses a paving of one uniform material of approved quality. Stone blocks moldering, tarred brick, cobbles, rotten planks, ill-conditioned macadam, or the picturesquely varied surface of Mother Earth in her roughest aspect, succeed each other in bewildering succession, and dispute possession of the streets, even down into the very midst of our busiest business centers. One of the causes for this state of things is doubtless found in the fact that no block in the city can be improved without the consent of the majority of the property owners, accompanied with a deposit of the estimated cost—a necessary and useful arrangement in some respects, truly, and an admirable provision for the protection of unwary citizens against the wiles of the knavish contractors of a few years ago; but one, nevertheless, which seems to work a serious discredit to the appearance of our city.

But one of the principal reasons for the desolate aspect of our streets intimated above, is the conspicuous absence of trees. Wheresoever they are planted and *allowed to grow*, they lend a grace, even to dilapidation, while they never fail to afford a beautiful and necessary foil to the most perfect architecture.

And here I wish to interpose a vigorous protest against the *gardener* fiend, who goes about with shears and saw, leaving bald deformity and relentless destruction in his wake! The finest and most promising trees go down before him, and the small modicum of umbrageous beauty we possess is either converted into some form of unnatural monstrosity, or is subjected to such mutilation as, alas! too often results in total destruction to arboreal life. Times and seasons never come amiss to the gardener fiend, and the more trees he destroys the better chance for him to sell others to replace them; and to aid him in his nefarious schemes he raises the nearly always false alarm of *dampness!* Go to the beautiful because leafy towns of Oakland, Alameda, San Jose, Santa Rosa, or Sacramento, and ask the inhabitants thereof if the lovely and verdant sentinels, which, in double ranks, guard each shady street and wave high in air their graceful, leafy plumes—ask, I say, if *they* find *dampness* a consequence of which to complain? Give me tall trees, branching trees, with abundant foliage, and plenty of them, and hail, all hail! to the noble and beautiful blue gum, to whose fresh, verdant leaves no speck of dust ever adheres, and from whose fragrant foliage exhales the very breath of health and sanitation!

What would this world be without the blessings of vegetation? Neither better nor worse than the hideous barrenness of lunar desolation! And yet the average man, in his blindness and folly, never ceases to make havoc of the perennial bounty of prolific nature. But even while she showers her abundant gifts upon her ungrateful children, they fell her forests year by year to gratify their boundless rapacity and selfishness, never even planting a sapling to replace the centuried monarchs, which they so ruthlessly destroy!

The average farmer only regards the trees on his land as something to burn, and, heedless of consequences, cuts down the finest of them all, to satisfy a passing need! The average townsman is also an enemy to trees, and avoids them whenever he can. The man of intelligence alone regards trees as they really are,—agents of mercy in the hand of God, and endeavors to renew, by planting, the verdure destroyed by his ignorant neighbor. The benefit of trees in the streets of a town, and especially of San Francisco, should not need to be explained. We are every summer swept by comparatively cold trade winds from the west. Every tree planted acts as a wind guard, and serves to modify the blast in its passage across the peninsula.

Rows of trees planted in our streets would greatly temper the harshness of our climate, and would render the town a much more agreeable place of residence, especially to people in delicate health, outside of any considerations of beauty.

But attention has been drawn to the general condition of San Francisco only to furnish a reason for the observations which follow. It seems wholly unnecessary to enlarge on the themes above briefly touched, which one would suppose must be so apparent to those who allow themselves to be interested in such matters, as to sound somewhat trite.

Nor must it be supposed that the city possesses no natural beauty whatever, for even while I write, on the upper levels of California Street Hill, over-looking the city, the fog has swept across the lower portions, revealing only the larger buildings, and the City Hall, the Synagogue, Trinity, St. Ignatius and other churches, and the great hotels lift their domes, towers, spires, and roofs, through its soft and swathing mantle, and the rising sun gilds them with a glory of soft, matutinal beauty which must be seen to be appreciated, while the Mission Hills beyond, with their lovely waving lines of delicately shaded gray, with the blue mountains of San Mateo County towering beyond, all together present to the admiring gaze as pleasing a picture of quiet beauty as any often seen.

And here I would add a word concerning towers. These appendages to buildings, ancient or modern, notwithstanding their often apparent inutility, never fail to lend a grace and dignity to a structure, or group of structures, to which they may be attached, unattainable without their aid,—a lofty line leading upwards; a tapering spire reaching heavenward; a square, bold mass rising abruptly against the sky; a graceful pinnacle, whose delicate outline is a perpetual protest against the coarseness and ruggedness of every day life—all, all, are types, of things mental, intellectual, and even spiritual, which in their silent way may act upon the soul, and do their humble, patient, but, nevertheless, noble work of elevating, refining, and spiritualizing to some extent, more or less, the base materialism to which we are all inclined. And by purifying the perception, and educating the taste for the pure, the sublime, and the beautiful, may in some measure prepare the popular mind for the reception of some things that are not popular, namely, the *true*, the *noble*, and the *good*.

To return to our subject. All that San Francisco, that any city needs to become beautiful, not only as seen from the hill-tops, or at a distance, but even in every nook and corner of it, is *supervision*—and improvement. Supervision by people of taste, observation, and experience on the artistic side of practical, every-day life. Such men as *architects* are or ought to be. Who so well fitted as they (constantly engaged as they are in the construction, improvement, and adornment of buildings), to see and suggest the æsthetic needs, necessities, and possibilities of the various localities in which they reside.

Some years ago, in a New England village, it matters not which, there lived a man who saw—well, first of all he only *began* to see—certain disagreeable and descreditable things in the neighborhood in which he lived.

The village was an ordinary village,—white-painted clapboard houses, with green shutters, here and there a "brick." In the principal street there was some sort of attempt at paving; in places, fragments of sidewalks stretching away into the borders of the town, and ending in foot-paths beside dusty roads in summer, and muddy roads in winter. Irregular dilapidated fences inclosed ill-kept front yards or gardens, lined by treeless, desolate streets, or perhaps having a chance tree here and there apparently by accident. Each householder plodding on in his own fashion, altogether regardless of his own or his neighbors' surroundings.

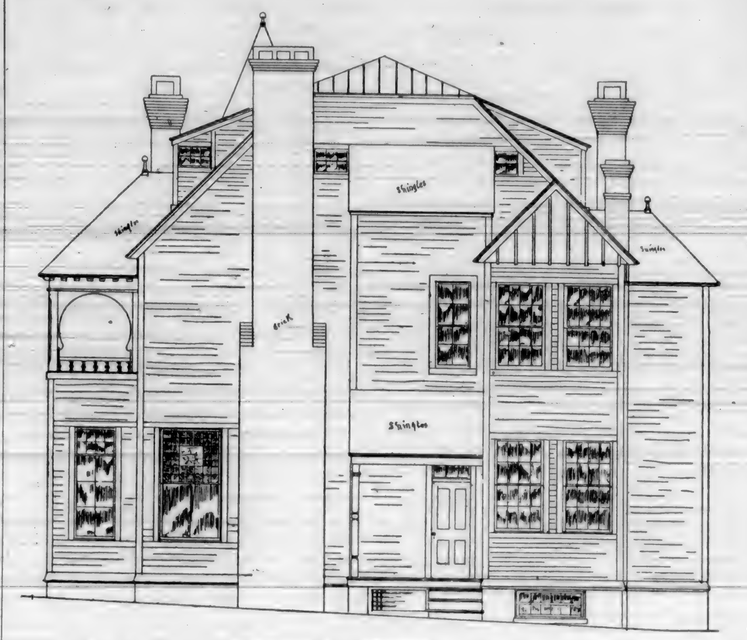
These matters began to interest him, and he felt convinced that by some sort of concerted action a better state of things could be brought about. He gathered together some of the most intelligent of his neighbors, and after meeting with the usual amount of opposition, persuaded a few of them to join him in effecting a few improvements in their own immediate neighborhood. Their street was nicely paved; sidewalks were put in order; front yards improved; fences repaired, and houses painted some other color than white. Trees were planted, and gardens laid out; and they were surprised to find that their property had sensibly appreciated in value. That settled the question with the opposition. The dollar was eloquent, if the man was not, and improvement spread. Trees grew, roses blossomed, beauty began to be developed out of ugliness, and passing travelers began to say, "What a pretty village." Soon dwellers from the neighboring city began to look in, and one or two came to make a summer resort of the place; then others came; better houses began to be built; trade improved; and still improvement went on. The original "improvers" became a permanent society, called a "Village Improvement Society," which found an echo in other dilapidated villages. All sorts of expedients began to be adopted to make country towns and villages more attractive to city dwellers, so that at the present time there are few places in New England, in the neighborhood of large cities at least, which have not felt the impulse of improvement. But it may be asked, What has that to do with San Francisco? It may be answered that what is possible in a village, is equally possible in a large city, and with still greater possible results. The difficulties may also be greater, but one thing is certain, improvement pays, and that is an argument, appealing as it does to the innate selfish interests of the average American home, which seldom fails to attract his attention. The next question in order is, of course, What do you want us to do? I answer, in the first place, Simply to convert the San Francisco Chapter of the American Institute of Architects into a Committee of the Whole on "Local Improvements," and to let each member of the Chapter consider himself appointed as a standing Committee of Investigation and Suggestion, whose duty it will be to report at any meeting of the Chapter on all the various and sundry needs, necessities and possibilities of his own particular neighborhood. In the second place, to endeavor on every available occasion, to interest his neighbors by every available means in joining in the "Improvement Mania." On fit occasions the whole Chapter might interest itself in drawing the attention of the citizens of some particular locality to the desirability of effecting some special object—such as the planting of a street for instance, the improvement of some one of the many unimproved squares in the city, the uniform pavement of some leading street, the placing of a fountain or a "toilet Kiosque" in some public place.

It is a noticeable fact that San Francisco possesses as yet not one public lattrine! Where is there a city of like size in which such a state of things can be found to prevail, in any really civilized country? As to fountains, there should be one in every park and in every prominent place in the city, especially in the neighborhood of the principal saloons. Local societies of property owners together with such members of the Chapter as happened to reside in the vicinity, would be very desirable and doubtless possible in certain quarters.

Some adequate efforts might be made towards converting Van Ness Avenue into a "Boulevard" with park lots, and grass-margined sidewalks. It would soon become one of the most attractive features of the town, and would be a good beginning. It is said to have been the original intention in regard to that thoroughfare.

All that is needed is to get the popular ear, capture the popular eye, and arouse popular attention in the interest of the popular pocket, and the thing is done! For I hold that any improvement in the appearance or convenience of a neighborhood will at once be found to affect the commercial pulse, the pulse which controls the golden current, which circulates like life-blood throughout the popular body, and is at once an indication and a test of the state of the public health not only in a sanitary point of view, but mentally and intellectually as well; for prosperity as surely follows, mental and moral advancement as does health follow sanitation; and both in their way form respectively a basis for the better life, which is the real strength, not only of individuals, but of communities and nations.

* Paper read before the San Francisco Chapter of Architects, October 5, 1884.



REAR ELEVATION OF $5,000 COUNTRY DWELLING.—3d PREMIUM DESIGN.

Painting Shingled Roofs.

MORE shingle roofs are painted now than ever before in the history of building in this country. It is mostly seen in cities and suburban towns, although in the country it is by no means rare. Considerable inquiry has led to the conclusion that many have their roofs painted to add to their appearance, which in many cases it certainly does, while others labor under the impression that the paint acts as a preservative to the shingles. The latter are probably right, provided the paint is renewed as often as it needs to be. If the roof is allowed to remain with the paint partly worn off, the shingles will retain more moisture, and consequently decay sooner then they would were they not painted at all. On the score of durability, little can be gained in cost by painting. A good shingle roof unpainted will last a great many years, and the expense of painting it a few times would replace it. One painter, who had painted the roof of his own house, when questioned by a representative of the *Lumberman*, used good logic from his stand-point. He thought that painting a roof would add somewhat to its length of life. "You see," he said, "that I have painted mine. I do for myself what I desire to do for others. If I did not, the influence would be bad."

American Architects.

THE American Institute of Architects will be convened in annual convention on the 24th inst., and continue in session three days.

The aims, objects, and purposes of the institute should enlist the earnest, thoughtful interest of every intelligent and worthy member of the profession in the United States. It should be recognized and treated as the great "*camp-fire*" of the profession, around which all should gather—if not in person—in fraternal thought and reflection, at least once a year. As the "*parent organization*," it has exerted a very beneficial influence in numerous cities and towns, in the organization of local chapters, and the bringing together in fraternal fellowship and intercourse, thousands with interests co-equal and alike, who otherwise might have remained estranged in sympathies for all time; and it is to be regretted that there are and always will be some—and some very excellent and competent men in the number—who prefer professional bachelorhood—a pre-eminent selfishness—rather than a liberal and generous, personal, and intellectual intercourse with others as worthy in all respects as themselves.

To such, there is a standing rebuke in the fact that the parent body has had and holds in its list of membership, many of the brightest lights of the profession—men to whom every intelligent architect in the United States is indebted to a greater or less extent, for the very information and knowledge which enables them to handle with greater perfection the numerous intricate principles and problems involved in the practice of correct architecture.

At the time when the institute was first founded—1852—almost co-existent with California as a State, the architecture of the country was still in the tight laces of ancient ideas, but very few attempting in their conceptions to depart from the teachings and examples of Angelo, Wren, and others of those whose names and memories will continue coeternal with the grand architectural monuments upon which their names are inscribed. But with the coming together, in 1852, of men of common sympathies and interests, and the development of more enlarged views and fraternal sentiments, there was a nucleus formed, which has since opened out into a broader field of thought, and led to innumerable results—in conception and execution—differing widely from those of former ages, yet practical; serving all present purposes well; in harmony with the advancements of the period; suiting and serving existing conditions better, and more pleasing to the tastes and fancies of present generations, who construct and build, not to meet the views of their successors in life, but for their own present pleasure or profit.

The history of the institute from its inception until the present, is interesting and worthy the sincere attention of every well-wisher of the profession. As before stated, the date of its inception was 1852, but as the result of our country's trying times, when bloody strife, instead of the peaceful pursuit of architecture, prevailed, its meetings were discontinued and its archives consigned to temporary obscurity, until in 1864, when the return of peace had so far removed the gloom of the past, that the members of the institute renewed active operations, and have since continued, each year enlarging and increasing its influence, and pointing to the time when interest in its welfare will be universal, with all good and true men of the profession.

From an address delivered before the institute (Mr. Gilman), we quote: "It is to the position taken by the institute, and to the wise, beneficent measures inaugurated and urged on the general community by our own body, that I look mainly for the future improved position of the profession, and for the gradual education of the public taste in all that relates to our complicated and fascinating art. I may say now, what I have never lost an opportunity of saying, both in private and public life, that I consider it a great privilege—the greatest privilege in fact that can belong to the professional architect—to become a member of this body, and thus be permitted to aid, individually, as well as collectively, in the great work that we have to do."

Although S. F. Chapter was first organized as the "Pacific Coast Association of Architects," as such its success and permanency was doubted, inasmuch as several attempts of similar character had not long survived their organization. With Mr. Augustus Laver as the first—and at that time the only "Fellow" of the institute in San Francisco—a knowledge of its high character, and of the great benefits likely to flow from union with the central head, led to an earnest desire by all the members, that the "Association" should resolve itself into a "Chapter," which was duly accomplished; since when its growth in interest and permanency has been steady and continuous, and is now well established. And if all the reputable brethren of the profession would, with unity of high purpose, and the earnestness of which they are capable, join heart and hand in setting in motion and perfecting all that a united body of well-meaning, honorable architects may and—if they will—can accomplish, S. F. Chapter would equal the best and most prosperous, as it is now in membership, one of the most numerous Chapters in the United States.

St. Peter's and Angelo.

"To POPE Julius, the world is indebted for that wonder of architecture, St. Peter's Church, at Rome. The vanity of Julius had prompted him to order Michael Angelo to give him a design for his tomb, which the great artist made upon so grand a scale that the choir of old St. Peter's Church could not contain it. 'Well, then,' replied the pope, 'enlarge the choir.' 'Ay, holy father, but we must then build a new church, to keep up due proportions between the different parts of the edifice.' 'That we will do,' replied the pope; and immediately gave orders for the sale of indulgences to carry on the erection of the noble fabric.

"Some of the figures intended for the pope's Mausoleum, the famous figure of Moses sitting in St. Pietro da Vincuti at Rome, and two or three of the slaves at the Hotel de Richelieu in Paris, are preserved. The original design of the tomb is engraved in Vasari; it has much of stately gothic grandeur in it, and was to have been decorated with thirty-two whole length figures of prophets and apostles."

"Eastern" Specifications.

WE have before us copies of printed specifications published in Chicago, intended by the author to meet all of the specification requirements for buildings costing from $500 to $10,000. However well adapted they may be for the purposes for which they are intended in Eastern cities, they are in many respects inapplicable to the architectural and constructive arts as practiced upon this coast. To fit them to the building customs of California, they would require considerable corrections, the materials named in numerous cases being altogether different from those known and used on this coast for like purposes, and the general idea of construction differing considerably. Reference is made, not to the intrinsic merits of the documents, but more especially to the fact that the architectural and constructive practices established upon this coast are largely in contrast with those of other cities,—to a great extent special and original, and the greater part of the lumber material particularly. Being Pacific Coast production, it is a very difficult matter for any one to arrange specifications suited to materials special to Eastern markets, and to professional and mechanical customs prevailing, and differing greatly from those in common practice in California.

Eastern Architecture.

WE present on page 185 a new phase of Dwelling Architecture now being introduced in Chicago. As shown, the front is intended to be of pressed brick, with brown stone trimmings, and large carved panel of terra cotta on second story. The porch is of wood with iron railings. The roof is of red slate, and the mansard of black slate, both thus making a strong contrast. The finish of the house throughout is first-class.

This design is well adapted to this coast, and is in striking contrast to the bay window system of this city.

We are indebted for the illustration to the kindness of the editors of the **Inland Architect and Builder*. The engraving presened so many new features that we desired the pleasure of placing the same before our readers. The editor of the journal mentioned forwarded the plate to this office, for which thanks are hereby tendered.

Balance of the numbers of this year given free to all new subscribers for 1885.

*Published at Chicago, Ill.—$1.75 per year.

W. H. Williams.

THE father of Warner Haywood Williams, the late Stephen H. Williams, was well and favorably known in this city as an architect and gentleman of most scrupulous integrity and uprightness of character, both in and out of the profession. Commencing the practice of the profession in the early days of California, his experiences ran with the numerous changes and exciting scenes which characterized the City's history, up to the day of his death.

The son having the advantage of a thorough training under and with so excellent a father and thoroughly competent architect, entered upon his professional life's work well qualified by example and precept to attain an honorable reputation, and work out for himself a name and fame in the practice of his profession and in domestic spheres, which will bring respect and honor to him in life, and when time's work shall have ended, surround his memory with remembrances worthy of imitation by those now most dear to him, and those who may hereafter fill the place now so creditably occupied by him.

Mr. Williams was born in the city of New York, on the 9th day of February, 1844. Attracted by the glowing accounts of the new El Dorado, his father, leaving his family behind him, set sail for California, and arrived here in June, 1850. In July, 1852, the family rejoined the parent, arriving on the 13th of August. After a few years' study in our public schools, Mr. Williams entered his father's office, on January 2, 1860. He continued there first as an apprentice, and afterwards as a partner, until Sept. 6, 1872.

W. H. WILLIAMS.

Salt Lake City at that time presented to young, energetic men an unusually favorable opening. Mr. Williams concluded to try his chances there, and in the middle of September, 1872, arrived in that city. He remained until January 16, 1873, when, finding business very slack, he concluded to leave Salt Lake, and try his fortunes in Oregon. He arrived in Portland, January 23, 1873, and immediately opened an office for the practice of his profession.

Mr. Williams has worthily won the esteem of the business men of Portland and vicinity. Some of the largest and finest buildings have been erected under his careful supervision. He is also an active worker in various secret orders, and was one of the delegates to the Conclave recently held in this city. He is an active member of San Francisco Chapter of Architects.

Professional Perils and Perplexities.

IT is a common superstition among those who contemplate building that the employment of an architect, though it may lead to a better appearance of the proposed building and possibly to some other æsthetic and practical advantages, will surely result in a much greater outlay than was originally intended,—that all following of professional advice will lead to an empty treasury or new assessments and appropriations.

With honest architects—and it is a waste of argument to discuss dishonest people of any sort—the opposite result should be obtained, and doubtless would be, if the instructions given by many clients were not so absurdly unreasonable, loose, and contradictory. Nothing is more common than for the size and number of the rooms to be marked down, the height of the stories, the kind of material and the quality of work desired, and then, the incidental instruction added, that the whole is to cost five thousand dollars, or two, or ten, as the case may be.

One might as well go into a tailor's establishment and order a certain number of garments of a certain size and style, made of specified goods, and trimmed in such a way as he directs, and then himself fix the price for which they are to be furnished.

It is by no means an uncommon experience for an architect, honestly aiming to carry out as nearly as possible the instructions received both as to quality and cost, to find, when the contractors' estimates are brought in, that his ambitious client is enraged or discouraged because his five gallons of requirement cannot be put into his half-peck measure of appropriation. He, therefore, flatly refuses to pay for what has been done, on the ground that, through the fault of the architect, he cannot use the plans.

If building houses were an exact science, if it were easy or even possible to say how much it would cost to build any given thing, there would be some ground for this excuse; or if the instructions concerning the amount to be expended were as emphatically set forth and maintained as is the necessity for introducing certain points in the construction of the building,—an extra window or door, two feet more in width for the hall and three feet more in length for the dining-room, hardwood finish, a stained glass window on the stair landing, oak floors and open fires, a few finished rooms in the attic, a deep cellar and absolutely perfect plumbing,—all these and many more necessities arise during the discussion of plans, and the architect, unwisely, perhaps, but very naturally, infers that, as nothing more is said about keeping within the appropriation, it is preferred to exceed it if necessary rather than forego these advantages. In fact, in most cases, it would be wise if he did, for unless a man must cover the whole cost of his house with a mortgage—in which case he has no call to build at all—it is usually the best policy to carry out a satisfactory plan thoroughly rather than spoil it forever by too rigorous economy.

In the majority of cases, when contractors' estimates exceed the desired outlay, it is not primarily or chiefly the fault of the architect. And it should always be borne in mind that a contractor's estimate is not a safe guide as to the actual cost.

But in case it is plainly owing to the carelessness, the ignorance, or faulty judgment of the architect that the necessary cost of carrying out the plans exceeds what the owner is able or willing to spend, what should then be done? Clearly, as it appears to us, the architect should make such modifications in them as would make it possible to bring their execution within the appropriation. Having done this, or signified his willingness to do so, the man who refuses to pay him for his plans is unquestionably unjust.—*The Builder*.

Another Competition Fraud.

THE Board of Directors of the Victoria (B. C.) Theater Company have placed before architects, through the medium of the press, a proposition to present plans in a public competition for a theater; also, additional brick buildings to cover a space of 36x120. Total area to be covered with buildings, 96x120.

The printed notice is plain in regard to the structure. The theater is to be of brick, and contain parquette and dress stalls, first gallery or dress circle, and second gallery. In addition to the theater, a three-story building, for hotel purposes, is to be erected. The cost of the whole work, complete, is put down at the moderate sum of $35,000. This sum is to include everything, with seating, lighting, and ventilation for theater, and completion of brick buildings, stores, rooms, etc.

"The architect whose design may be adopted, will be paid the usual commission *if the work is carried out under his supervision;* otherwise the sum of $250 will be paid *as bonus without superintendence,* as ordered by the Directors."

We have received from "Observer" a communication in regard to the above mentioned building. The gentleman with the *nom de plume* given stands high in a professional capacity, and his thoughts are entitled to consideration.

BAIT FOR ARCHITECTS.

VICTORIA, B. C., September 30, 1884.

TO THE EDITOR OF THE CALIFORNIA ARCHITECT—*Dear Sir:* Knowing your views, and that of the San Francisco Chapter with regard to architectural competitions, I inclose you a copy of the advertisement which, in their liberality (?) or ignorance, the Directors o the new theater here have issued. The amount offered as bonus and the terms proposed, among other things asking for specifications and estimates, are refreshing in their liberality—a little over a fourth of what ($875) any architect could claim for preparing plans and specifications alone *on an order*. The Directors offer a little over the fourth for the *chance of being paid*, competing with perhaps twelve or fifteen others! It is evidently the object of the Directors to get plans and specifications to build from and save half the commission.

Several plans of some merit have already been received from local and foreign architects, who got private information before plans were advertised for. Therefore a choice was not wanting to the Directors, and makes their conduct the more strange. I think I may safely say that no local architect will now send in plans. Very truly yours, OBSERVER.

We notice the same objection in the notice alluded to above that appears in the statements contained in the advertisements or circulars giving particulars of various competitions that have taken place on this coast, viz.:—

The sum stated in the advertisement will be paid to the architect whose plans are accepted, but the directors claim the privilege of electing their own architect to superintend the building, even if the superintendent never presented a plan.

That this is unjust is apparent to all right-minded people; $250 will not pay the labor of the draughtsmen employed to work up the architect's plans; and then to be debarred from superintending his own plan—if it be accepted—is an outrage to all professional architects.

We are assured by competent authority that the amount named as the limit for cost of building is totally inadequate to the ideas entertained by the Directors.

A Word to Publishers of Architectural Works.

THERE seems to be a growing tendency among publishers to issue works containing Architectural Designs. Descriptions of buildings are given and an estimate for which they can be erected. This is all well, but care should be taken not to mislead people who buy the books, in regard to the COST of the buildings. A page should be devoted to a table containing the rate of wages, prices of lumber per M., bricks per thousand laid, plastering per yard, painting per square, and all the rest of the items necessary to complete the building. Great care should be exercised in this particular, and all the amounts given be such that absolute dependence may be placed upon them. Of course, this table would contain the amounts for which the building could be erected at the place of publication of the book. If this were done, it would be an easy matter for one in California to estimate the difference in cost it would require to erect and complete a building of any desired plan. We have heard of many complaints from parties to whom we have furnished books; they followed the plans, the cost of which was given at, say $1,500; and, after spending $2,000, found that their house was not fully equal to the plan they followed.

We think if publishers would follow the suggestion mentioned, it would remove one great objection to the purchase of books by parties residing in different localities to the place of publication.

New Styles of Hardware.

WE call particular attention of those interested to the new advertisement on back page of cover. Huntington, Hopkins & Co. is one of the most substantial firms on the coast, and carries a stock unsurpassed by none. They invite owners and builders to call and examine the new styles of *bronze* hardware. These they keep in great variety. Every variety of mechanics' tools known to the trade, from the smallest gimlet to the finest iron planes, will be found in this establishment. They are also agents for many of the prominent patented inventions which have gained sush popularity on this coast. Carpenters in the country who desire a first-class "kit" of tools, should address a note *first* to this firm, as their immense stock will enable them to fill any order. Prices of everything in the hardware line in conformity with the quality of goods sold.

Smoky Chimneys.

FROM a paper read by Mr. J. P. Seddon before the health conference in London last month, the following abstract is made: Chimneys smoke from five causes: 1. Because air is not supplied to houses systematically, like water, but is, rather, excluded. 2. Because fire-places are illy-constructed, being drawn over from the openings of the fire-place to the flues in such a manner as to provide large vacant spaces above the grates, which contain cold, stagnant air, in contact with which the smoke becomes chilled and is prevented from being drawn into the flues. 3. Because flues are usually made too large. They should seldom be more than nine inches square. 4. Because no provision is made for down-draughts of air to expend themselves before reaching the fire-place. 5. Because architectural guards are not constructed at tops of chimneys against wind. Mr. Seddon depreciates the use of cowls.

Hanging a Grindstone.

TO HANG a grindstone on its axle to keep it from wabbling from side to side requires great skill. The hole should be at least three-eighths or one-half inch larger than the axle, and both axle and hole square; then make double wedges for each of the four sides of the square, all alike and thin enough, so that one wedge from each side will reach clear through the hole. Drive the wedges from each side. If the hole through the stone is true, the wedges will tighten the stone true; if the hole is not at right angles to the plane of the stone, it must be made so, or the wedge correspondingly must be altered in the taper to meet the irregularity in the hole.

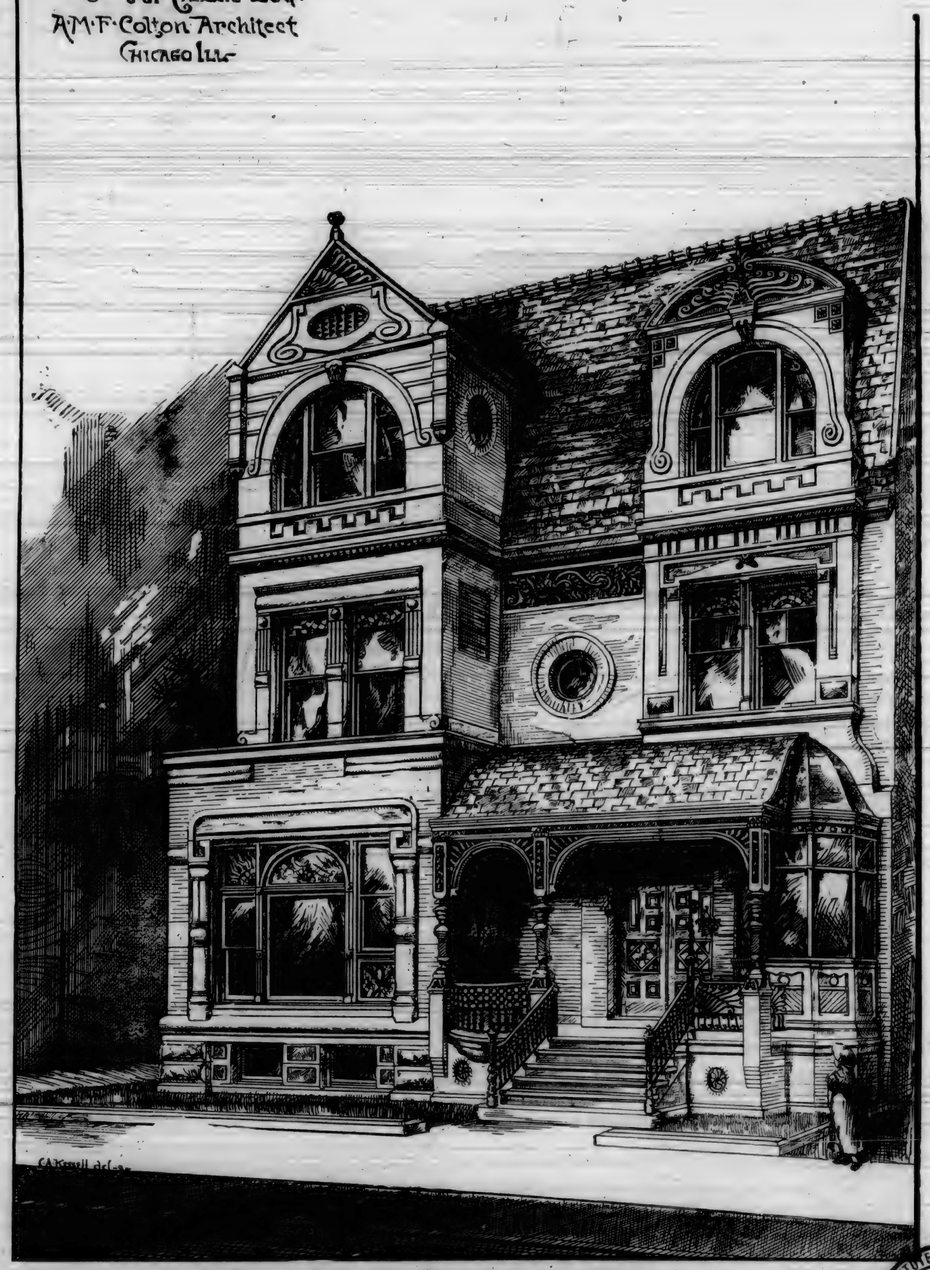
Bancroft's Histories.

THIS magnificent work embraces a complete history of the Pacific States. The territory covered is the western half of North America, from Panama to Alaska, including all of Central America and Mexico, and is equivalent in area to one-twelfth of the earth's surface.

There are to be thirty-nine octavo volumes, with maps and illustrations, fifteen of which are now ready. They will be well printed on good paper, neatly and substantially bound, uniform in style, and will average over 700 pages each. Three or four new volumes per annum will appear until the entire series is completed. Subscribers will not be obliged to take the work unless it corresponds with the description in every particular.

	PER VOLUME.
Bound in Extra, English Cloth, neat and attractive style	$4 50
Bound in fine leather, Library Style	5 50
Bound in half calf, half Russia, or half Morocco	8 00
Bound in Russia Leather or Tree Calf	10 00

Any information in regard to the above will be given by addressing the office of this Journal.



A NEW PHASE OF DWELLING ARCHITECTURE. (SEE PAGE 182.)

INSTITUTE OF BRITISH ARCHITECTS MDCCCLXIV

Sources of Ornamentation.

A. C. BOND.*

NATURE is to be considered merely the germ of ornamental art; art must develop nature's suggestions, combine her forms and, besides pleasing the eye, subserve a purpose. Forms and colors seen in nature excite admiration of a very different kind from that involved in the artistic rendering. This rendering must please the eye, gratify the taste, and exhibit fitness for its special intention. The art of the past, that aggregation of experiences derived from the application of the suggestive hints of nature, is simply a means of study to the ornamentist, an aid to the mastery of principles and rules. The range and variety of illustrations to be found in nature represent every principle on which beauty depends; its study supplies a fertility of resource, even as regards construction, as well as the harmonious arrangement of parts, the ornamentation of those parts, and as to the degree of prominence which decoration should assume. But it is in decoration setting forth the special qualities of the artistic mind, conforming what is material to a designed purpose, expressing the perception and feeling of beauty and truth in the designer, that its great interest lies.

In designing, the decorator has to take into account two kinds of expression, the one definite and certain, the other conventional and capricious, the former dependent on natural principles, the latter upon association. The force of association was illustrated when, in France, archaic severity in ornament, at a period when republicanism had triumphed, was regarded as "the thing," and decoration assumed a funereal aspect. In projecting ornamental designs, as in realizing their effect, mental impressions have to be taken into account in artistic rendering. Thus, in form, angular expresses strength and durability; the curvilinear, softness, delicacy, and fragility.

Definite forms may be classed as the rectilinear and rectangular, the rectilinear but oblique angled, curvilinear forms without contrary flexures, curvilinear forms with geometrical contrary flexure, and curvilinear forms with contrary natural flexure. The discovery of the means by which expression is given to them involves an extensive process of comparison. Often their conjunction has merely the significance that attaches to playfulness and delicacy.

The adoption of ornamental treatment suitable to a material, has a decisive influence on design, as in gold in sheet—beaten, raised in lobes, fluted to give strength and shadow; in wire—in coiled, spiral, and numberless curved forms. Stone has its natural expression in masses, chamfers, etc. This condition does not exclude one material taking designs proper to another. Foliage should perform no office other than ornamental, such as adding richness and variety, filling out forms, and covering junctions, as in metal work. Hence the impropriety of supporting a canopy on the innate stability of a floral boss.

The Persians, in seeking to produce masses of brilliant and variegated color without offensive gaudiness, betook themselves to mosaics for the adornment of their walls and the exterior of their mosques, showing magnificent incrustations glistening a vitreous glaze. The radiant hues being natural, the colors and tints of real stone could not offend the sight; there was a certain sobriety even in the splendor of surface. Beautifully veined and naturally tinted woods have a charm independent of the design into which they enter, whilst the design, taking them into account, is also enhanced in its effects.

The character of material used for decorative purposes necessarily affects the essential features of ornament. Lustrous or dead surfaces, hues, or intrinsic qualities are themselves constantly suggestive of new devices and effects. Mechanical operations and chemistry, brought to the preparation of materials, wonderfully augment the resources of the ornamentist. Both the art and science are illustrated in enamels, which, having for their base hard, resistive substances that are ground to an impalpable powder, and blended with cohesive elements, are rendered plastic and absorptive of color, finally being fired, so placing an essentially perishable colored design beyond the reach of change.

There are mysterious properties in colors that serve the purpose of the ornamentist, and suggest various departures in design that result in excellent effects without apparent rule. The eye, for instance, possesses the power to supply the complementary color of the hue on which it rests. A celebrated French painter remarked that every bed of violets was surrounded with a halo of purple. Again, whatever the laws that regulate color—and theories and deductions on this point differ—their æsthetic value or influence on the sentiments must be taken into account for satisfactory treatment.

A reed, a flower, a broken stem, what significance may not attach to them when elevated to decoration, as the reed in the flutings of Corinthian columns, the flower in moulded form or beaten metal as a symbol or emblem, like the lotus of Egypt, the broken stem setting off curvilinear lines in a capital or in the mouldings of a cornice, a band or frieze on a vase, or on a panel in simulated carelessness of rendering.

To what are we to ascribe the simply perfect use of color by the Orientals? Whether they use the brightest or most subdued tones, it makes no difference, the patterns are harmonious and gratifying. They value the color only as it assists the purpose of design. As all pleasing effects obtained in decorative art are referable to the conjoined or separate expression of the laws of harmony and contrast, it would seem as though by some latent principle of mind, or passive reception of the subtle teachings of nature, they had unconsciously acquired their marvelous aptitude to treat color not only appropriately but so as to secure the best results. It is the same with their faience, their enamels, their silk stuffs, and their tapestry and embroideries, executed with surprising manual rapidity, and often without a formal pattern, and not merely in color. Whether by instinct or tradition, they have a marvelous appreciation of true form and proportion.

A man, aided by a child, constructs a gigantic jar as we build a house, and with no other instrument than the hands and a spatula, an amphora of extreme height, and presenting beautiful curves, is produced. On the borders of the Nile, females with their children make alkarazas so elegant in form as not to need the aid of color to command admiration. With Orientals, the sense of the beautiful shows itself in all things.

Flat ornament is the most natural and obvious means of decorating solid surfaces, and this in conventional form. The source of this appropriateness is to be found to resent, so to speak, the moulding or carving of natural forms as something simply imitative, and, therefore, with all the labor and ingenuity exercised, of no high order of art, and therefore not conforming to an imposing position.

In many branches of art the designs are drawn direct from nature. The designers of textile fabrics may be seen with a group of flowers, freshly gathered from a garden, in small vases before them, arranged so as to present some novel or pleasing effects, which are transferred, in modified form, to their patterns. The same colors or precisely the same forms, may not be reproduced, but the flowers and the portion of the pattern dealt with.

Sometimes the flowers that serve as models for decorative metal work are pressed between boards, so as to present an aspect, to some extent conventionalized, for treatment in bas relief. This method of securing the originals of patterns has for ages been adopted in the East, and serves to account for some of the really exquisite transformations that we witness.

Many forms of the ornamental class are not naturally supplied. Such is the Greek fret series of squares, one within another, interior lines being brought up at intervals, thus getting rid of the mere square. Arabic decoration, though very ornamental at first sight, was in reality based on extremely simple combinations.

It is a curious fact that some of the choicest patterns, apparently of Eastern origin, of the Eastern carpets, have been reproduced from the paintings of old Flemish masters—Van Eyck, Memling, and others, and the Florentine artists, such as Ghirlandago and Montegna. So also with partieres and table covers. Some of these painters simply give divisions of color and main outline of the patterns, and in place of angles substitute curves; others, like Hans Holbein, delineate even the very stitches.

In a design of varied character the desirability of introducing a few points of resemblance between the forms, thus establishing certain affinities, provides a contribution to decoration. The securing appropriateness in the ornamentation is another requirement that has its influence in fashioning ornament. The ox heads and festooned garlands carved on the friezes of Roman temples, had a practical value as betokening sacrifice, whilst in other public buildings they would only have been stupid and vulgar.

Consonance or agreement with the general design is a prime element of good ornament, and it is just because this consonance is not found in ornamentation of a different purpose that the ornamentist finds so much in bygone art that cannot be utilized. The introduction of an opposing tone in colors to impart unity of effect, is a leading element in color design. The upholsterer who brings together two colors—say yellow curtains with green covered chairs—will wisely repeat the green in the curtain in a narrow strip the same as the chairs. Contrast usually involving alternation, some of the most beautiful effects of form are obtained through their connection. To the contrast of form and color decoration owes some of its happiest inspirations. A further source of beauty in ornament is derived from the prevalence of one quality in color, or of a given size of form over another.

It is noticeable that all that is lovely in landscape is produced by contrast of tone, not color—by the bright green of young shoots against the dark, somber green of the older wood; by the gay, light larch against the dark, green fir, and these against the deep, blue sky as a background. The present advance of decorative art is largely due to more attention to contrasts, and to their more skillful manipulation.

The circumstance that the mind never draws the line too close between use and ornament, has led in articles of vertu in the precious metals to the blending of both in structural forms, and with little conventionalism as regards ornament. An instance occurs to us in a silver standard consisting of a stalk with leaves of the aloe plicatalis regularly folded within the other in alternate directions. The richness of the material justifies the labor and ingenuity expended on elegance of forms. Similarly, on vases of precious metal nature, leaf, foliage, flowers, and stems may be imitated as closely as one pleases in relief, or as undercut work, if only care be taken that it shall fill up a defined and bordered space.

In the arabesque style of foliage and tracery there is a mild freedom which pleases the fancy, partly because no actual natural forms are portrayed, whilst yet they are suggested in the flowing outlines, in the lightness with which the ground is touched and yet transformed in effect, and the way in which the sight is lured to traverse over the whole surface. But as a means of decoration, arabesque is to be used charily; it has indeed the charm of repetition, but where uniformity is equal, the beauty of forms is in proportion to their variety. The harmony established is by analogy of size, color, and form, but affinities may be carried too far. The true law of harmony is conformation and diver ence.

The collected experience of artisans of the past constitutes a leading source of ornament. Carvings and mosaics, figured tissues, stained glass, metal work, even paintings and architectural treatment of decoration, supply a fund of artistic instruction, not for reproduction, but suggestive of new combinations.

The course of ornament, renewing at intervals of time features of previous periods, with new characteristics superadded, has its counterpart in seeds transplanted to new soils and climes, the change resulting in developments that in some respects are wholly new.

* Written especially for this Journal.

Saw Milling in th California Redwood Districts.

ALTHOUGH there may be minor differences, a brief description of the methods employed in logging here will apply to the business generally. The roughness of the ground and size of the timber necessitates an entirely different system from that pursued in the East. Jack-screws take the place of cant-hooks and peaveys, and, instead of a single team, eight or ten oxen with block and fall, or a steam engine is required to move the larger logs. First come the choppers, or rather sawyers, as most of the timber is sawed down now, and it requires much skill and experience to fell these giants without breaking and destroying much valuable lumber. Following these are the barkers with axes and long steel bars to remove the bark. Then fires are set which burn most of the bark, limbs and brush, and if the tree has been broken or split in falling the devouring flames soon find every defect. In due time the sawyers, swampers, jack-screwers and road-builders put in an appearance and perform their respective parts of the work. One man handles a cross-cut saw eight to ten feet in length, and if the applicant for this position does not possess unlimited hope and the muscle of a Sullivan he never gets through the first 10-foot cut. If the logs are up on the side hill, or in some of the side gulches—nearly all redwood grows on rough ground—two men with jack-screws roll and slide them down to where they can be reached by the long, slow-moving 10-ox teams, which take them to the landing on stream or railroad. Where the ground is steep a number of logs are attached to each other by the use of dogs, or steel hooks, driven deep into the logs near the end and connected with chains, and in some places, bridle chains are necessary to retard their progress down the hills. If once the logs get to running their speed is increased by being bumped and pushed by the logs behind until there is danger of running over and ruining the whole team. Such cases require great skill on the part of the driver, but if he understands his business and has sufficient time in which to deliver himself of a volley of oaths, as only a "bull-puncher" can, the oxen are warned of the danger and are seldom caught.

On more level ground the roads are made by imbedding "skids"—logs from 12 to 15 inches in diameter—about half their depth in the ground at right angles with the road, about six feet apart, and the logs are hauled lengthwise across these skids. This would seem as hard work as hauling a cat by the tail, but not so. The friction is removed to quite an extent by the use of oil or grease on the skids and usually 1,000 feet is taken for each yoke of oxen in the team, and in some cases much more. Logs exceeding six feet in diameter are usually split into two, three, or four parts by the use of powder or wedges. This facilitates handling them both in the woods and at the mills, but often at a sacrifice of much fine lumber. As a means of getting the logs to the mills, railroads are taking the place of natural water ways. The size and weight of these logs, the rapidity of the mountain streams, and the uncertainty of floods sufficient for driving purposes, are strong arguments in favor of railroads, and there is no doubt of their superiority over the old way. At first sight an Eastern man accustomed to handling small, light logs, is impressed with the idea that everything moves too slowly here and that little is accomplished, but when we realize that many of these logs are from 50 to 100 inches in diameter, and that the green butts are so heavy that they will sink in the water like a stone, we conclude that these loggers understand their business, and have adopted the best methods.

In the mill there is a mulay, double and single rotary, edgers, butting saws, two planers, which give a capacity of about 50,000 feet per day. The clear lumber passes directly from the saws to the planers, and is dressed green. While it is probable that many of the modern inventions in mill machinery could not be successfully applied in this timber, there is no doubt but the mills here generally can and will be much improved. The few gangs which have been tried are thrown out as impracticable, and steam feed, improved set blocks, live rolls, gang edgers and butters, etc., are the exception rather than the rule. That active competition which has compelled the manufacturers in the Northwest to adopt all new labor-saving appliances would no doubt have a beneficial effect here in reducing the cost of manufacturing, and in due time they will come.—*Northwestern Lumberman.*

Garland Trap.

THIS excellent preventive against sewer gas entering houses, has achieved a reputation in California ahead of all competitors. Some of our largest hotels have lately substituted the Garland for those previously in use, and the result is more than satisfactory to the occupants. Full particulars in regard to the cost, etc., of these traps, can be ascertained by either writing or visiting the manufactory in Oakland.

Modern House Painting. $ 5.00

ONE of the English papers points out that every gas-meter in a large building is a source of additional danger in case of a big fire. In large public buildings, apartment houses, and tenements, there is generally a separate meter for each suite of rooms. The lead pipes are melted by the fire, sometimes even by the heated air before the flames reach them, and then the inflammable gas does its share towards spreading the conflagration. Says the journal referred to: "The gas poured into burning buildings through such openings doubtless helps materially to account for the surprising suddenness with which many great buildings have been swept by the flames, and in all cases the outflow of gas must seriously counteract, if it does not altogether thwart, the efforts of the fireman."

Ventilation of Sewers.

THE ventilation of sewers by gratings over the manholes may not always be satisfactory. The commissioners of sewers of London have entertained the notion "that in all instances where new houses are being erected, the commissioners of sewers place themselves in communication with the building or other owner, and treat with him or them for the construction of proper ventilating-shafts in the chimney-breasts of party or other walls, for the purpose of ventilating the sewers, carrying the ventilating-shafts well above all adjoining roofs." The ventilation of sewers by uninterrupted communication from the sewers through the house-drain and soil-pipe of each house, has long been urged in America, but this suggestion may be a new one to our architects and builders.

An Ingenious Device for Taking Down a Chimney.

AN ingenious arrangement for facilitating taking down an old chimney was designed and put into use at the Middlesborough Iron Works.

The chimney had to be taken down from the top and the bricks lowered inside, as it was situated in a crowded locality and it was desired to lower them with as little damage as possible, as they were to be used again for building purposes, and would have been broken by throwing them down on the inside, and lowering by ordinary mechanical means was too tedious, and, in the present instance, impracticable. The following device was adopted, which would allow them to fall by their own gravity, and at the same time be cushioned sufficiently to break their fall and prevent damage. In order to do this an air-tight iron box was placed at the bottom of the chimney; this box was fitted with an air-tight door mounted on hinges and closing on an India rubber face, against which it was tightened by a wedge.

A wooden spout, the edges caulked with white lead, making it air-tight, was then fixed on to the top of the box and carried up the chimney. The inside measure of this spout was slightly larger than a brick, so that the air would cushion it sufficiently to break the fall and prevent damage. The air-tight box was opened by an air-tight door, which, when full, was opened by a workman at the bottom, and the bricks removed. This device was simple, ingenious, and proved quite effective.—*The Building Trade Journal.*

NEW EDITION.

Ferguson's History of Architecture.

Two large volumes, beautifully printed, splendidly illustrated. Every Architect and Draughtsman should possess a copy of this work. Price, post-paid, $15.00.

REMEMBER.

Balance of the numbers of this year given free to all new subscribers for 1885.

CARPENTRY.

By L. D. Gould, New Edition	$2 50
Album of Mantles	8 00
How to Build, Furnish, and Decorate	5 00
Building Superintendence	3 00
Eastlake's Hints on Household Tastes	3 00
Manual for Furniture Men	1 00
Shavings and Sawdust	1 50
History of Architecture	15 00

NEW BOOKS.

Leffel's House Plans.—Contains elevations, plans, and descriptions of houses costing from $500 to $3,000, at New York prices of labor and materials. The size of the book is 8x11 inches, printed on good paper, and neatly bound. Cost, $2.50. Copies can be had at this office.

To those desiring to build, but whose means are somewhat limited, this book will be found of special interest. The plans are all of modern design, and embrace conveniences in keeping with the amount specified. One objection to the elevations is the low height of the stories. In California, much greater height is given to the ceilings than our friends of the East desire. Many of the plans would be found impracticable if stories were made 12 and 11 feet high, without the area was enlarged on account of stair room, etc. On the whole, however, it is one of the best works we have received at the price quoted.

History of Architecture.—By Ferguson. We have received a supply of this justly celebrated work. It should be in the possession of every architect. Draughtsmen especially will find it very entertaining and instructive reading. Two large volumes. Price, $15.00.

What Dulls Varnish.

IT may be said in general terms that all influences that tend to retard drying will also impair the lustre of the work, and that the large majority of flatting is caused by chilling the varnish while only partially dry. Hence, in all cases of flatting or deadening, the painter is forced to the conclusion that the trouble is entirely the result of his own oversight or neglect, and not by any means due to the quality of the varnish.

The loss of lustre of the varnish soon after it is applied is almost invariably caused by the varnish being exposed to too severe action of the atmosphere before it is thoroughly hard. This may be caused by a badly protected shop, which allows cold air to pour in through every seam, and to thus retard the drying of freshly varnished jobs; or the painter thoughtlessly runs a fresh carriage out into a cold repository soon after the varnish has "set," and it undergoes thorough chilling while partially soft. Coal gas in the varnish room, coming often from the stove, and frequently from the smith shop under the varnishing department, is likely to cause varnish to deaden at any time.

Many painters do not realize how comprehensive the term "drying" is. Finishing varnish continues to harden and dry for many months after spreading, and it follows that when a finished job is judged to be able to take care of itself a few hours after the varnish is dust dry, any neglect of it, based on that conclusion, will usually be followed by disastrous results. The colder the season and the slower drying the finishing varnish used, the longer should be the time allowed a nice job to thoroughly dry before exposing to the elements (from three to five days, according to circumstances).—*The Painter.*

How to Make a Bed.

WE are inclined to think that few people really know how to make a bed properly, or they are too much in a hurry to put things to rights in a chamber to be thorough. A writer in a Philadelphia paper ventures the following practical remarks on the subject:—

"Let every bed-maker, as soon as all the covers are spread, turn down the upper sheet and all above it, leaving a generous margin below the bolster. Some people, you know, pull all the covers straight up to the top and lay the bolster upon them, so that when bed-time comes they must be arranged at the head. Boys don't like this way, and perhaps some other folks don't either. It is the custom to pile two big, square pillows on the top of the bolster, and then put on two pillow-shams, and then, sometimes, or perhaps before the pillow-shams, a sheet-sham. This is setting a trap for the unwary. Only a remarkably careful woman is equal to the task of getting off all the 'finery' properly. Why not almost, if not altogether, abolish shams of all kinds? Why not honestly take off the big, square pillows and supply every bed with a comfortable bolster to take the place of pillows? If you like adornment, embroider or decorate the slips and sheets themselves without any make-believe. Silk, lace, and the like seem out of place on a bed, which should suggest repose. Imagine a big boy with boots on flinging himself into the midst of a fairy creation of pink satin and torchon! Let beds be what they look like, and let them look like what they are—real resting-places."

Unoccupied Houses.

THERE are, always have been, and ever will be croakers,—wise (?) men who presume to grasp and comprehend more of the future than any of their neighbors, and who are ever ready to proclaim their extreme wisdom and foresight in all matters, interests, and affairs, from the most insignificant and local, to the grandest of national magnitude. Many such, prophetically inspired individuals in San Francisco, have, from time to time, during the past two years—lifting the vail of the future—discovered that too many houses were being erected in this city; that the supply was far in advance of demand; that the continuation of building activities would result in a large array of "houses to rent," without people to occupy them. Every unoccupied building is urged as confirmatory evidence of the theory advanced, and two or three empty dwellings in an *occasional* block, is held as proof positive of the early tumbling of all tenement property in rentals. This sort of prognostigation has been going on, and is prevalent at the present time; and the comparatively few houses labeled "*to let*," pointed at as ominous of pending disaster.

But what are the facts? The "*To Let*" sign business as practiced by real estate men and house renters, is ludicrous and extravagant. If but a single house is empty in a whole block, the "To RENT" show bills, printed in large black letters, on cloth or paper, from 8x12, to 14x20 inches, are pasted on every available part, so that on the front of a two-story house with bay windows, it is common to see a poster on each of the three or four window openings at main story, as many more at the second story, others on any single window opening that there may be, and at the front entrance—more generally on both sides of a sign board so placed as to protrude beyond the line of the street fence, to catch the eye of any one, up or down the street, a thousand feet away. It is a common thing to see from eight to twelve of these "*to let*" signs on an ordinary two-story house, and the number is increased when there is a basement or other stories additional. Consequently, upon approaching a block where but one house is labeled to rent, the array of "*to let*" signs in sight is sufficient for the renting of a half dozen, and where two or more occur in he same block—particularly if adjoining each other—the appearances are decidedly demoralizing, and well calculated to mislead the judgment of those who form conclusions from general appearances, without examining minutely into the true state of the case.

Should a person spend half an hour riding over one of our street-car routes, along which, within the twenty or thirty blocks passed, there should be ten houses to rent, he will have seen from *seventy-five to one hundred* of those showy signs; and the impression created becomes fixed that there are a great many unrented houses, while, as a fact, the number is comparatively small, notwithstanding the large addition of new buildings erected during the past two years, with no present indications that the near future, if years to come, will witness any material abatement in building activities.

The more important inquiry, however, is not so much the number, as the class and description of buildings which fail to find ready occupants. Those who have given any special attention to the matter, will have noticed that the idle houses are generally those built several or many years ago—less convenient than the more modern planned, and far less complete in their appointments and finishes. And of the number, basement houses are by far the more numerous, thus demonstrating the fact that people prefer to live above, rather than one or more feet below the surface of the ground, and that the day has passed in which tenants find pleasure in running up and down the extra flights of stairs necessary in basement story tenements. It is and will be so, that those who are compelled to pay rent, will seek the best they can find for their money, and owners of houses unsuited to the neighborhood, inconvenient in arrangements, well worn, and in need of repairs, painting, whitening, etc., need not wonder that rent-payers vacate, when, for the same or less rental, nicer and more convenient homes can be had.

Terra Cotta vs. Stone Trimmings.

THE manufacturers of terra cotta are putting forth commendable effort to induce the use of these productions, for trimmings and ornamentations in the fronts of brick buildings. In some of the Eastern cities, the new idea of clay manipulated into various forms and shapes, as a substitute for cut stone, has been adopted in very many cases. There are several illustrations of the work in this city, notably, Gladding & McBean's building, No 1358 Market Street; also DeYoung's building on Farrell Street. The same has been adopted for the front of the Pioneer Hall, on Fourth Street, and in other cases. Its more general use will depend upon the judicious and harmonious use of it in its introduction by architects, and the degree of favor accorded by owners. Architects and producers may kill off the possible success of new things possessing merit, by forcing them, and making them particularly conspicuous in advance of an appreciating sentiment among owners of property. By the use of terra cotta, elaborate ornamentations may be had at moderate cost, where numerous new patterns or moulds are not required in the same job, or patterns already made will answer the purpose, the patterns and moulds being the more expensive part of the work. Several very handsome specimens may be seen in the office of this journal.

PATENT CHIMNEY BUILDERS.

NOTICE.

I have a new, light weight, fireplace and chimney complete, which I wish to dispose of in part or in whole, to responsible parties. For further particulars inquire of T. C. Nativel, East Oakland Pottery, Brooklyn, Cal.

MASONS' AND BUILDERS' EXCHANGE
OF SAN FRANCISCO,
Room 11, 314 Montgomery St.

BELOW will be found a list of the members composing this Exchange. Boxes are provided for each member, so that architects, owners, or others desiring the services of any particular member, or those having boxes who are not members, and yet whose business is directly connected with that of the Exchange, can readily secure the attendance of the party sought, by leaving a note in the respective boxes.

San Jose—Second, cor. Reed. Two-story frame and brick basement. O., M. P. O'Connor; A., Theo. Lenzen; C., carpenter, Thos. Livingstone; mason, L. C. W. Otto; $30,000. Los Gatos Road nr. town. Two-story frame and brick basement. O., T. Burgess; A., Theo. Lenzen; day's work; $8,000.

Vacaville—Two-story brick. O., Ulatis School District; A., A. A. Cook; C., J. B. McKenzie; $11,800.

San Mateo—Two-story brick. O., San Mateo Library Association; A., Percy & Hamilton; C., J. Cox; $10,500.

Oakland—Webster, nr. Twentieth. Two-story frame. O., Convent Sacred Heart; A., B. J. Clinch; C., J. Binet; $3,100. Broadway cor. Prospect Ave. School house. O., City of Oakland; A., S. and J. C. Newsom; C., C. R. Lord; $7,000. One-story frame. O., J. J. Meehan; A., T. J. Welsh; C., J. Glenan; $1,500.

Alameda—Central Ave., nr. Willow. Three one-story frames. O., Mr. Wilson; A., S. and J. C. Newsom; C., W. Clark; $6,500.

Petaluma—Four one-story bricks. O., I. G. Wickersham; A., T. J. Welsh; $8,000.

San Rafael—Two-story frame. O., J. Sheehy; A., T. J Welsh; C., —— Robertson; $10,000.

MARKET REPORTS.

Lumber.

PINE lumber may be quoted at almost any price from $14.00 to $20.00 for rough, and $22.00 to $35.00 for surfaced.

The price of redwood is better maintained, although large concessions may be had on schedule prices ruling a few months ago.

Nails

Are selling at $2,90 rate for 10s.

Parquet FLOORS
All Styles of ¾ in. thick, tongue and grooved
Wood Floors in the European styles. Also
WOOD CARPET
or Ornamental Wood Floors, 5-16 inch thick for rooms of all kinds, in new and old houses. We make a specialty of these goods for Floors, Wainscoting, Walls and Ceiling, both Plain and Ornamental. We have the largest variety, largest stock on hand, and the largest factory in the U. S., as well as a large saw mill and factory in a first-class timber country, devoted exclusively to this business, and defy competition in price or quality of goods. Send stamp for book of designs and prices, and the size of your rooms for diagram & estimates

Rooms 11, 12, 13, No. 240 Montgomery Street.

TERMS:
PER ANNUM $2.00 IN ADVANCE

ENTERED AT POST-OFFICE AS SECOND CLASS MATTER.

ADVERTISING RATES.

Front Cover, outside, each insertion $2.50 per square.
Back Cover, outside, each insertion, $2.00 per square.
Page preceding reading matter, $1.75 per square.
Page following reading matter, $1.50 per square,
Inside Pages, each insertion, $1.00 per square.
Full Page, inside, one insertion, $40.00.
Each subsequent insertion according to agreement.

A square is seven-eighths of an inch in length by width of column.

Advertisements alone inserted that refer to materials used in the construction and furnishing of houses, and to matters and trades belonging to the building interest.

NO OTHERS RECEIVED.

Advertisements inserted for three months or less ar payable in advance; payable quarterly when inserted for a longer period.

When money is sent for subscriptions, the receipt of a copy of this journal is an acknowledgment that it has been received. Unless requested we do not send receipts.

Progress of Building Operations.

AT no time in the history of this city have there been as many buildings under process of erection at this season of the year, as is shown by our reports in another column. In looking over our files, we find nearly double as many now under way, as is recorded for any similar period of any previous year.

This is certainly a most gratifying exhibit, and proves that our prosperity is of the most substantial character. One of the influences that has greatly helped the grand total of building improvements, is the assistance that has been extended to people of limited means, through the aid of BUILDING AND LOAN ASSOCIATIONS. More than 100 houses have been built through the instrumentality of these societies, and we confidently expect in the future to record many more transactions of this character, than is shown by past records.

During the past month there have been started in this city

101 BUILDINGS OF THE VALUE OF $418,266.

This is most certainly a large and gratifying statement to make for November. While it is naturally to be expected that this ratio cannot be kept up for the next three months, still from the number of jobs now in architect's offices, we can confidently predict a large list for next month, and 1884 will be the banner year for the number of building improvements recorded.

San Francisco Chapter, American Institute of Architects.

THE regular monthly meeting was held on the 7th inst., Vice-President, A. Pissis, occupying the chair.

Mr. R. H. Daley was elected a member as Fellow, and C. J. Laver as Student Member.

The committee appointed to make awards to the pupils of the various classes, reported as follows: To the S. F. Chapter, A. I. A:—

GENTLEMEN: We have carefully examined the work of the pupils under our charge during the last year, and cheerfully recommend the prizes to be distributed as follows:—

First prize in free-hand drawing, Max. G. Bugbee, of the office of Wright & Sanders.

First prize in architecture, Louis Stone, of the office of Curlett & Cuthbertson.

First prize in mathematics, Robert Freese, of the office of Newsom & Gash.

We also recommend special prizes for their general proficiency, and for remarkable progress in the several branches, to Wm. Lee, office of Wright & Sanders, and E. A. Williams, office of Curlett & Cuthbertson.

Respectfully submitted,
ALBERT PISSIS.
J. GASH.
G. H. SANDERS.

The report was unanimously adopted. Action in regard to the award of the premiums was deferred until next meeting, in order that those securing the premiums would have the chance at that time to exhibit their sketches, etc.

(The sum of $50.00 was appropriated by the Chapter to purchase suitable books for those receiving the awards as recommended by the committee.)

A matter which is likely to become one of great interest to both parents and youths, and which may also become an important one in the history of the Chapter, was introduced and discussed favorably, looking to the establishment of a school or some method or system by which school boys, during leisure hours out of school, may have an opportunity to practically demonstrate their mechanical genius, each according to his inclination as to specialty preferred; carpentry, carving, modeling, in metal devices, machinery, or any other of the mechanical arts.

A committee of five was appointed to take the subject-matter under consideration, and to confer with the Directors of the Mechanics' Institute as to the advisability of co-operation, consisting of Messrs. H. C. Macy, J. J. Clark, G. H. Sanders, Wm. Curlett, and James E. Wolfe.

A member present made some inquiry in reference to the "Restoration" of Carmel Mission Church, Monterey County, which led to statements from some of those present who had visited the old church prior to, and since its alteration from what it was in its ruins, to what it has been made, during the present year; and from the information presented, a feeling of deep regret on the part of the members of the Chapter was expressed, that better judgment had not been exercised, and the old structure preserved by faithful restoration, to pass down to future generations, as one of the monuments of California antiquity.

The two articles appearing in this issue—"A New Idea for Boys," and "Restoration! *vs.* Ruins of Carmel Mission Church," more fully present the subject-matters discussed before the Chapter.

OCTOBER, NOVEMBER, and DECEMBER numbers of this year will be given free to all new subscribers for 1885.

Master Mason's Association.

THE aversion to combinations regulating special interests, and presumably fixing and regulating prices to the disadvantage of purchasers of materials, or the employment of labor, is universal with all classes of owners; consequently, whenever any one class of mechanics or building operatives organize as a body, —it matters not how reasonable, right, and proper their action may be—how well sustained by honorable and just principles of self-protection—the suspicion of monopoly and extortion attaches; and those seeking to embark in building ventures, as a rule, scan the condition of the material and labor market, before entering into any definite, progressive arrangements. This is all natural, as no human being, not even the individual participants in the most reckless and soulless extortion ring, is willing to be extorted.

With this as a common rule of practice, among the first inquiries instituted by owners is, "Are there no 'corners' in material or labor?" "Is demand and supply in all directions easy and equal?" And among others the master mason's organization is quoted as suggestive of a "corner" in connection with the mason's work of both brick and frame buildings. This speculative inquiry has been answered in former numbers of this Journal, but as the question continues to be repeated daily, and some people seem anxious to have it believed that the brick masons of this city have combined in society organization for the special cause of advancing the cost of the mason's work, we again repeat, as a fact, that the prime motive, aim, and purpose of the personals of the society, was and is, safety and protection from the uncertainties of the sub-contract system, by which, through the ignorance of values of work and material, or the dishonesty on the part of many original contractors, large amounts have, from time to time, been lost by sub-contractors in all the various branches, and largely so by master brick layers. And while the frequency of failures by original contractors is much less than in former years, there is still a certain degree of risk in sub-contracting, which is sought to be obviated by the master masons demanding their rights as original contractors for all specialties in their line. There is no rule among them regulating prices—that being left with each member of the association to determine according to his own judgment. Nor does the existence of the society preclude those who have not become members from participating in all offered competitions; consequently, owners have the option to confine figuring to society limits, or they may go outside of these, and seek the advantages to be found in those who prefer to take all chances, and catch jobs as best they can.

WHAT has become of the straw lumber which, three or four years ago, we were told would revolutionize the lumber business?

Dwindling Away of Old Customs.

AMERICANS are noted the world over for their ingenious methods and contrivances in adopting machinery sufficient to perform much of the heavy work required in and about buildings; and it is in ill accord with the present plentitude of building novelties for builders and contractors to increase their risks by pertinaciously clinging to a clumsy and inferior kind of scaffolding, and to bungling means for raising materials, instead of adopting contrivances of a scientific and safer character.

Crowds of hodmen continue to excite the pity of the multitude who chance to witness their toilsome climbing, encumbered with the shouldered hod. Apart from the waste of strength involved by a man lifting his own weight with a load of fully one-fourth of that amount in addition thereto, there is no little danger in a fagged, drowsy, or partly tipsy laborer ascending a lofty, upright ladder with a hod seemingly well devised to shoot out a brick or two from its open end. Passers by and workmen on the job are further imperiled when the hodman steps off the ladder on to an already overloaded, slender scaffold, especially when he happens to be quickly followed by a mate making strenuous efforts to poise on his head a badly balanced mortar board.

It is only in country jobs that one sees the almost primeval method of hodmen carrying brick and mortar to the different parts of the building. In the large cities various contrivances have taken the place of manual labor. At first, a block and fall rigged to an overhanging pole were used, by which the various materials were raised to the required place. This innovation, however, at once displeased the hodmen, for with quick perception they saw that the idea, if improved upon, would be the means of displacing a large number of men. In this city, decided steps were taken by them to discountenance the use of any devise that would tend to substitute manual labor on buildings.

Some of the objections at that time used by the laborers to the new system seem rather amusing to mechanics in the later days. It was claimed that contractors would use the rope until it was completely worn out and thus the men below would always be at the risk of receiving damages from a rope breaking and the consequent fall of the board. The dust from the brick and mortar would continually be deposited in the strands of the rope and the friction caused by its rapid transit through the block would soon wear the rope out, and aside from the danger mentioned, be a continual expense to the contractor. That the assumption was a false one is shown by subsequent events.

The change from the old way to the new has been a gradual one. It is rarely now that a hodman is seen on our city jobs. The wheelbarrow has taken the place of the hod, and the inclined plane instead of the ladder. Steam power has superseded manual labor, and has to a large extent minimized the danger of accidents.

An inventor called at our office not long since, and showed us working plans of a design through which much of the labor on a building could be dispensed with. It consisted of a long pole firmly secured at the bottom to a carriage, the latter having small wheels to enable one to easily move the pole in any direction. Peculiar sliding extension arms were rigged to the pole, by which it was intended that the load of brick or mortar could be raised to any desired height, and be delivered to any part of a staging within a radius of twenty-five feet, or even if necessary to a much greater distance. We keep our promise to the inventor by simply stating his proposition without giving the details of construction of his "labor revolutionizer."

Put away the old and take on the new is now the motto of mechanics and contractors. Especial study is given to new ways of performing work quickly, and he commands the greatest respect amongst his fellows, who, by dint of hard study and application, can do, with but apparently a slight effort, the most work in the least time, through the methods employed by the knowledge gained in applying the principles gained by such study.

Kitchen Sinks.

AN erroneous idea prevails in the minds of many, that kitchen sinks in daily use requires oft repeated painting in order to prevent them from rusting. It is not necessary to paint them at all. The grease in the dish-water will keep the iron from rusting. All that is necessary is to keep the sink clean. No paint that we know of will stick to a kitchen sink for any length of time.

WOOD may acquire an oak, walnut or cherry tree color by staining it with ordinary tincture of iodine diluted with spirit until the exact shade is obtained. White shellac must be added to the iodined solution if the stain is to be made permanent, or the wood after the stain is applied may be French polished. The iodine may be laid on with a rag or a brush.

IF stove polish is mixed with very strong soap suds, the lustre appears immediately; consequently there is less dust to breathe and blacken.

SPECIAL OFFER.

BOUND VOLUMES OF THIS JOURNAL

TO NEW SUBSCRIBERS FOR 1885.

Upon receipt of $3.25 we will send a bound volume of this Journal of either 1880, 1881, or 1882 and the full year's numbers of 1885.

We have had an extra number bound of the years mentioned, and make this offer to increase our subscription list. We are bound to increase our list, so that the end of the year 1885 will witness not less than

TEN THOUSAND

Paying subscribers on our books.

FRONT ELEVATION OF $5,000 COUNTRY DWELLING.—4th PREMIUM DESIGN.

Our Fourth Premium Plan.

ON this and succeeding pages, will be found the full plans and elevations of the design to which was awarded the fourth premium in the competition held under the auspices of the editors of this Journal. Under the *nom de plume* of "Hoosier," credit for the design belongs to J. W. Hammond, Frankfort, Indiana.

The general character of the elevation is more in keeping with architecture as exemplified on this coast, than any of its predecessors. The arrangements of the rooms are shown very specifically by our engravings.

COST OF THE DESIGN SHOWN.

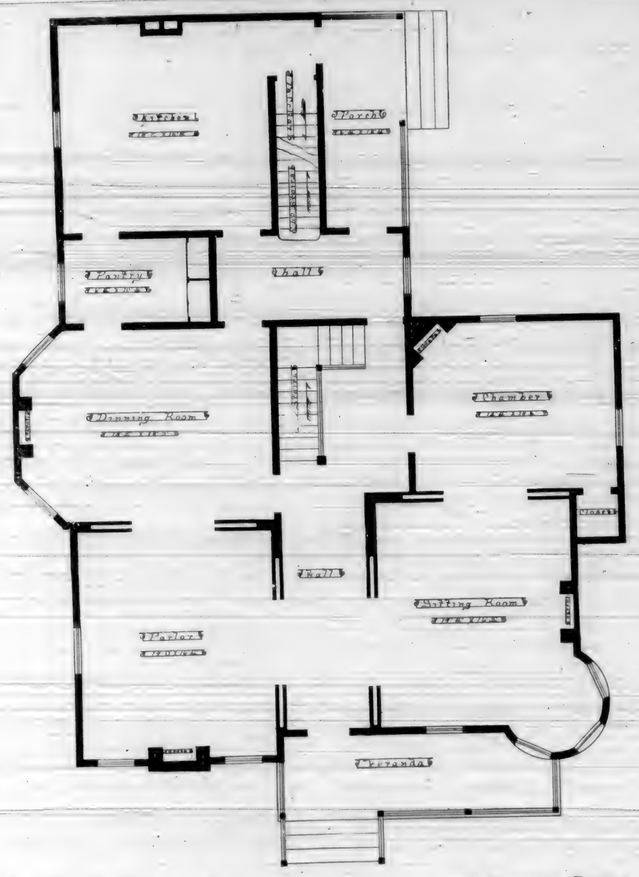
We want our readers to particularly bear in mind that the estimates given for the various competition designs are those for which the houses can be erected at the place where the designs were prepared. None of the premium designs thus far shown, can be built in this city or State for anything like the sum mentioned for each. In the present case the total amount would have to be nearly doubled in order to erect the building as per plans shown.

We give below a full estimate as furnished us by the architect. He assures us that it has been carefully scrutinized by one of the principal contractors of Frankfort, and that reliance can be placed upon the figures given as being correct.

ARCHITECT'S ESTIMATE.

Estimate of material and labor required in the erection and completion of the plan submitted by "Hoosier" (J. W. Hammond).

155 yds. excavating @ 25 cents per yard	$ 38 75
2,800 ft. stone foundation @ 15 cents per ft	420 00
140 ft. cut stone @ 40 cents per ft	59 00
35,340 brick @ $9.00 per M	318 00
1,940 yds. plastering @ 25 cents per yd	485 00
166 yds. concrete and cementing @ 25 cents per yd	41 50



First Floor Plan of $5,000 Country Dwelling.—4th Premium Design.

15,188 ft. timber @ $17.00 per M.	$258 19
4, 448 ft. sheathing boards @ 20.00 per M.	88 96
5,550 ft. clapboarding @ 22.50	111 00
20,000 shingles @ $4.00 per M.	80 00
2,500 ft. sheeting @ $17.50	43 75
220 ft. belt, etc. @ 10 cents	22 00
Cornice	120 00
Tin work	100 00
4,171 ft. flooring (inside) @ $30.00 per M.	125 13
586 " " (outside) @ $35 " "	20 51
Stairs complete	150 00
Veranda	125 00
33 windows (box) @ $12.00 each	396 00
12 " (attic) $5.00 each	60 00
10 " (cellar) $5.00 each	50 00
42 doors complete $12 each	504 00
4 grates and mantles	160 00
Hardware	100 00
Plumbing	200 00
Gas piping	40 00
Painting	400 00
Carpenter work (not included in above)	500 00
	$4,893 79
Architect fees (complete) 5 per cent.	244 68
Total cost	$5,138 47

In making an estimate for California, there are several items in the above that must be materially changed. The price given for brick work should be doubled. Add twenty per cent. to the amount set down for plastering. Cornice and stair work are very low. Grates and mantles for the price given, would be too common to suit our ideas. Hardware is much too low. Price for plumbing would have to be multiplied by at least 3, in order to secure a job satisfactory to our "plumbing inspector," Other items are low in comparison with those for which the same work could be performed in this city.

We find the same fault in this plan that we mentioned in our remarks in those already presented in the competition series, viz., a total lack of wash-basins in the bed rooms, one only being shown in the bath-room. No water closet is shown, a fact totally inconsistent with the general character and size of the house.

We make the above remarks simply to call the attention of our readers on this coast to the lack of those things that we regard as "essentials;" the cost given being so much lower than the building will cost here, that no one will be led astray by adopting a plan for a $5,000 house, when we know that $8,000 will be required to finish the same satisfactorily to residents of the Pacific slope.

Night Work in Lumber Mills.

One of the principal causes of the glut in our lumber market is the greed for gain by our manufacturers; not content with running the mills under their control from 6 A. M. to 6 P. M. they seek to further enlarge their bank account by keeping them running the balance of the twenty-four hours. This is especially noticeable when large contracts have been secured, to carry out which, an extra number of men have been engaged. When the latter have been placed at their respective stations, it is policy in the company hiring them, to keep the men at least a month in their position. And just here is where the trouble commences. One mill running the full day, causes other mills to be run the same time, and, as a natural consequence, in a short time, a vast amount of lumber is manufactured, for which no present use can be found. A slight decline in the building line is met by a similar result in the price of lumber, and thus, those intending to build cannot, with certainty, lay their plans for any length of time ahead, owing to their inability to determine the price of the material most required for their purposes.

Our Exchanges.

We have made arrangements with the Editors of the following Journals, by which we are enabled to offer quite a reduction to those subscribing for any one of them in connection with this Journal.

(The figures in parenthesis denote the price of the journals alone.)

California Architect and Building News
Terms, $2.00 per annum.

With *American Architect* ($6.00), $7.00 per annum.

With *Builder and Wood Worker* ($1.00), $2.50 per annum.

With *Inland Architect and Builder* ($1.75), $3.25 per annum.

With *American Artisan* ($1.00), $2.50 per annum.

With *Building* ($1.00), $2.50 per annum.

With *North Western Lumberman* ($4.00), $5.00 per annum.

With *Scientific American* ($3.20), $4.50 per annum.

With *Leffels' Mechanical News* ($1.00), $2.50 per annum.

With *Decorator and Furnisher* ($4.00), $5.00 per annum.

With *American Machinist* ($2.50), $4.00 per annum.

With *The Wood Worker* ($1.00), $2.50 per annum.

With *The Builder* ($2.00), $3.50 per annum.

With *Hall's Journal of Health* ($1.00), $2.50 per annum.

With *Cincinnati Building Review* ($1.00), $2.50 per annum.

We will add to the above list from time to time, as our arrangements are perfected with the publishers. We are prepared to furnish any journal printed at the shortest possible notice.

Side Elevation $5,000 Country Dwelling.—4th Premium Design.

"ALL carpenters know how soon the butt ends of chisel handles split, when daily exposed to the blow of a mallet or hammer. A remedy suggested by a Brooklyn man, consists of simply sawing or cutting off of the round end of the handle so as to make it flat, and attaching, by a few small nails on the top of it, two round disks of sole leather, so that the end becomes similar to a boot heel. The two thicknesses of leather will prevent all further splitting, and if, in the course of time, they expand and overlap the wood of the handle, they are simply trimmed off all round."

The foregoing item has been going the rounds of the press for nearly a year, yet no one seems to have noticed its absurdity. Chisels used by carpenters are of three kinds: Firmer chisels, paring chisels and mortising chisels. Firmer chisels are the ones most generally in use and are employed for trimming off stuff, removing superfluous wood and sometimes making mortises in thin and soft wood, though this latter purpose is not what they are made for. The handles on firmer chisels *should* always be slightly rounded on the butt end, and in all cases the handle should be turned and have a ferrule on the end next the chisel. These handles are not to be pounded by a mallet; they may be tapped *lightly*, and the rounded end of the handle is sufficient protection to prevent splitting if this rule is kept in view. To use this class of chisels as mortising chisels, argues one of two things: Either that the user does not know his business, or that he does not possess the proper tools to perform the work he is at. Paring chisels should have flattened handles with the corners worked off, which would make a section of them like an elongated octagon, with four long and four short sides. A paring chisel is much larger than a firmer and is made thin and of a superior quality of steel. The handle should be something larger than the handle of a firmer, and on no account whatever should a mallet be used on it. The paring chisel is used for the finest kind of work and is guided in its movements altogether by the hand. The mortising chisel is a heavier-made chisel, and has generally, though not always, a socket on one end to receive the handle.

Mortising chisels are the only ones on which a mallet is intended to be used, and the butt end of the handle is protected with a heavy iron ferrule. These handles are turned in a lathe and the point entering the socket and the end receiving the ferrule, are fitted nicely to the places they are to occupy.

The idea of a carpenter or joiner using a hammer on the wooden handles of his chisels is something absurd; only a botch would be caught at so unworkmanlike a trick. Putting leather on the tops of handles to prevent them from splitting has been used by carpenters, cabinet makers and shoemakers for several centuries; by the two former on their bradawls, and the latter on their "pegging" and "sprig" awls. The cushioning quality of the leather requires a heavier blow for a given effect than when the awls are used without the leather.—*The Builder and Wood-Worker.*

To make plaster set quickly mix it with water into which a little sulphate of potash has been dissolved. To make plaster set slowly mix it with fine slacked lime. The time of setting may be regulated after a few trials by changing the relative proportions.

SPECIAL OFFER.

BOUND VOLUMES OF THIS JOURNAL

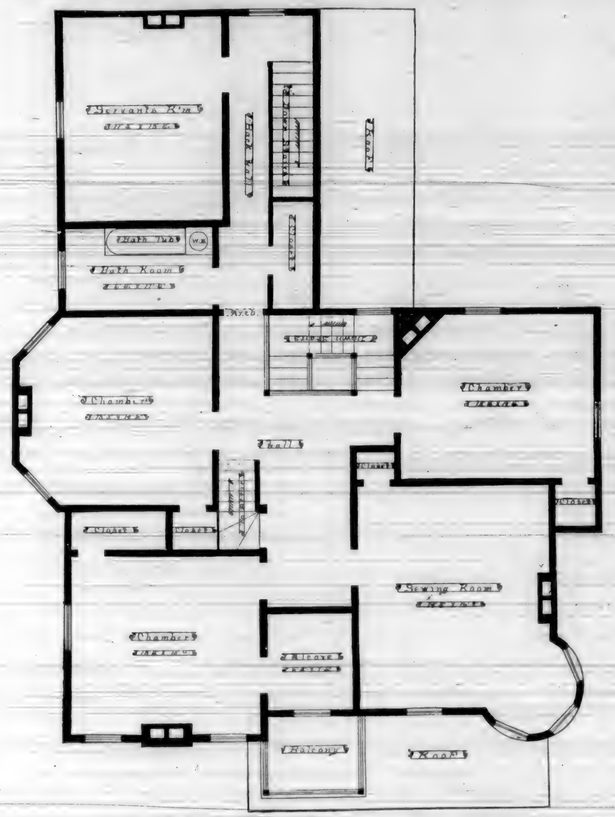
TO NEW SUBSCRIBERS FOR 1885.

Upon receipt of $3.25 we will send a bound volume of this Journal of either 1880, 1881, or 1882 and the full year's numbers of 1885.

We have had an extra number bound of the years mentioned, and make this offer to increase our subscription list. We are bound to increase our list, so that the end of the year 1885 will witness not less than

TEN THOUSAND

Paying subscribers on our books.



SECOND FLOOR PLAN OF $5,000 COUNTRY DWELLING.—4TH PREMIUM DESIGN.

The Locomotive of To-Day.

THE locomotive of to-day is a giant by the side of the production of 1851. The New York Central express engine is a very Anak. Its weight is 84,000 pounds, or nearly two and a half times heavier than its above mentioned prototype. The cylinders are eighteen inches by twenty-four. The average man's head is far below the top of the driving wheels, which are seventy-five inches in diameter. In 1854 a New York express passenger locomotive traveled 25,000 miles in a year; last year the average mileage per engine stood between 70,000 and 80,000 miles. A locomotive for express passenger service costs, taking the experience of the past few years, from $3,500 to $10,000 to build. In comparing the locomotives of to-day and a quarter of a century ago, you will notice that while the weight of the whole machine has increased greatly, certain of the dimensions have not altered much. This is because we are limited in various ways in constructing a locomotive. We cannot make the body of the engine over a certain width, because of the gauge of the track; not over a certain height, because we must keep the center of gravity at about the same position; not over a certain length, because of the wheel centers. So the locomotive must always remain nearly the same in form. It is to increased capacity of boilers that we must look for increase of power. At present an express locomotive boiler is of eighty-horse power, that is, if it were a stationary engine that would be its capacity. But when the locomotive is drawing a train of cars at five miles an hour the boiler supplies the strength of 375 horses, and at forty-five miles an hour the power expended is equal to that of from 700 to 800 horses. That's a curious fact, isn't it?—*Exchange.*

WHEN filing hand-saws there are two objects to be kept in view, namely, cutting off the fiber of the wood, and removing it as fast as it is severed. If the teeth be filed too fleaming, they will cut faster than they will remove the saw-dust. On the contrary, if the faces near the points be not dressed fleaming enough, the saw will *tear* out the kerf in a rough manner, rather than *cut* its way through the timber.

The Window of the Ark.

WE were much impressed, at a meeting held a few weeks ago, at various suggestions made in regard to the description of the ark as given in Genesis. The size of that immense structure was settled as being 450 feet long, 75 feet wide and 45 feet high, and was divided into three stories. (Does it not seem strange that our best vessels to-day are modeled in the same proportions as the first great vessel made under the direction of the Almighty?)

In this great leviathan, two of a kind of every living creature were gathered together. The discussion was rather warm on the subject of *how many kinds* there were at that time, and the point was not settled satisfactorily.

The main point, however, was in regard to the *window* of the ark. It was shown that the ark was built on the ground, and as the waters gradually rose, it was lifted from its foundation in a perfect natural way. Of course with the immense weight inside at least one-half of the structure was submerged. Necessarily the animals in the hold or bottom story, lived in absolute darkness. Now how did they get the fresh air which was absolutely necessary for their preservation?

There was but one window in the ark, in size, "in a cubit." A cubit is eighteen inches, so the window was eighteen inches square. We are aware that there is a dispute in regard to the size of the cubit; the size given, however, is that in use by the Hebrews. No matter whether it was smaller or larger than the size given, the other measurements would increase or diminish according to the size given to the cubit.

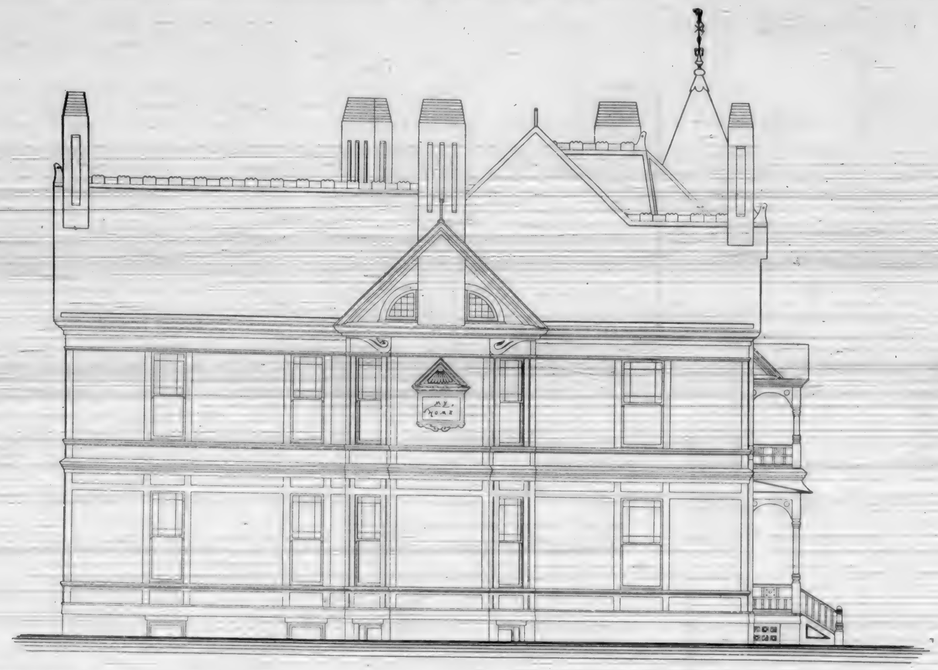
"Think of one window about eighteen inches square in the roof or near the top of this huge ship, and that remaining closed for 100 days after the flood began. The door was also closed. Moreover the vessel was pitched within and without. It follows that the entire ark was without ventilation. How, according to natural laws, could this multitude of living creatures endure such confinement without ventilation for a day, let alone 100 days, as mentioned?"

Some contended that the eaves of the roof projected over the vessel quite a distance and that under the eaves was an open space that extended around the vessel, giving room for ventilation. Evidently a false assumption, for the space would have afforded egress for numerous small birds, etc.

The window of the ark, and the means by which the latter was ventilated, we will leave to the tender mercies of the scientist, and the cool reasoning of theologians.

SLATE is simply a clay deposit under water, but it is a great resistant of water, and is almost fire-proof—much more so than marble or granite.

"Builders' Guide and Estimators' Price Book." A new edition just received. Will send a copy to any address upon receipt of $2.00.



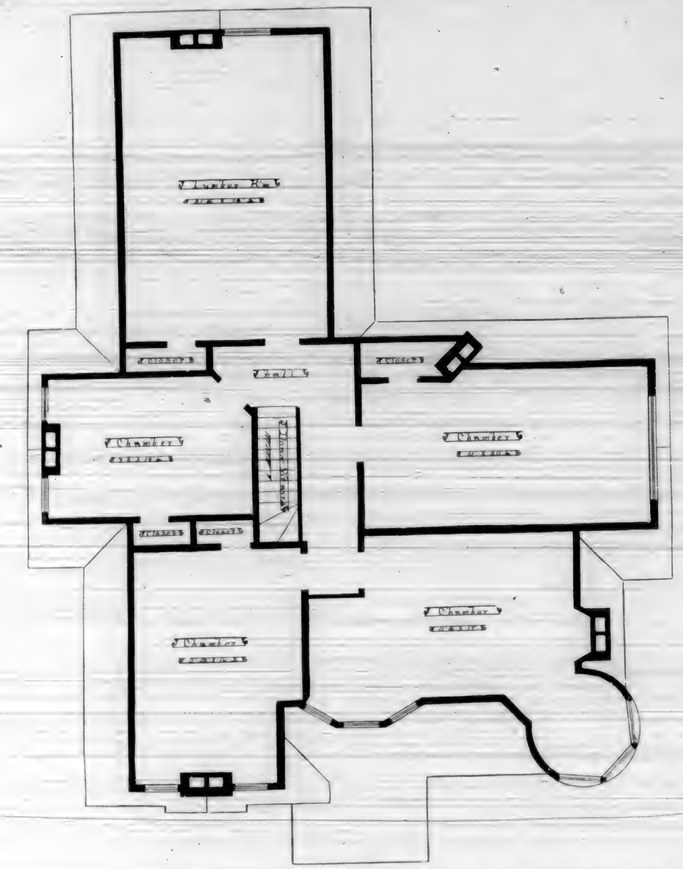
SIDE ELEVATION OF $5,000 COUNTRY DWELLING.—4TH PREMIUM DESIGN.

Separating the Branches.

THE rule prevails to a certain extent (and is sought to be made general), in San Francisco, in the erection of buildings, other than the shoddily built, inexpensive class, to separate the various branches of mechanism. There are very many "good and sufficient reasons" why this should be done, and fair and honorable considerations why but few, if any, segregations should be made. There are, and for many years have been, but few instances in which some few of the architects have not practiced the separation of the plumbing, plastering, painting and decorating work, in all ordinary, good, and better buildings. This has been considered a necessity, to avoid the sub-contracting of the branches to incompetent parties, who come not, even if they desired to execute faithful and good work.

But for the purposes of protection against the risks and financial uncertainties attending sub-contracting, and as a matter of right as master mechanics, all the more prominent branches have sought and are seeking to secure to themselves recognition as original contractors. Without, at the present time, presenting any argument *pro* or *con*, we suggest a few thoughts for the reflection of those who are striving to secure a concession from architects and owners, in the separation as asked for. To encourage and justify such a course on the part of architects, the spirit of kindly co-operation, good will and harmonious intercourse should be made the first principle of action. It is one of the most reasonable and natural things imaginable for men in positions enabling them to control matters to guard against every cause of unpleasantness and annoyance; and if by the segregation of the branches, disagreements, contentions and disputes arise between parties operating, about trivial matters, each pulling his own way, drawing lines over which he will not pass, nor allow others to pass; claiming points, and clamoring for rights, easements, and privileges not consistent with a liberal and unselfish disposition, thereby rendering it necessary for the architect to exercise his persuasive or authoritative perogative or authority,—a request to make general a rule of action liable to the results suggested would be extremely unreasonable. Consequently, the possession and practice of the right spirit, the spirit of mutual interest, integrity and co-operation, promptness of action, ready acceptance of all legitimate responsibilities, is a first necessity in those seeking to make general a rule by which every man shall be considered and recognized as a *master* in his special line of mechanism; and when this principle of action prevails, and architects become assured that the letting of the branches separately will not impose upon them additional trouble and annoyances, requiring of them patience equal to that of him who refused to "Curse God an die," then the realization of the result sought will be more likely of accomplishment in its universality.

PAINTING TIN ROOFS.—Tin on a house-top should be well painted once in four years. For roofs light, cool colors are preferable because they reflect the warm rays of light, and thereby lessen the expansion and contraction of the metal and the shrinking of the boards underneath, and so lessen the liability of the tin to crack in the seams. The temperature of attic rooms in summer will be materially lower if the roof be painted with a light rather than with a dark color. The writer has learned from long experience that the finest French ochre is the most economical pigment that can be used for that purpose. If, as is sometimes the case in country houses, where the roof is a conspicuous object in the architecture of the building, a dark color be indispensable, the use of pure Venetian red darkened with lamp-black, is recommended as the most durable and economical. If, by some process the oil used in roof-painting could be prevented from becoming hard and brittle, it would be a great gain. The poorest oil-paint, however, is better than neglect; and the best economy consists in keeping tin entirely and thoroughly protected from the corroding influence of dampness. Old paint, which has become "fatty" from exposure to the atmosphere, is better than new for roof painting. Not a drop of turpentine should be used for such work.



ATTIC PLAN OF $5,000 COUNTRY DWELLING.—4TH PREMIUM DESIGN.

Restoration! vs. Ruins of Carmel Mission Church.

AT the regular meeting of San Francisco Chapter, the 7th inst., the "Restoration!" of Carmel Mission Church, Monterey County, furnished a theme of discussion, during which statements were made by members of the Chapter present, who had visited the once universally revered, sacred relic of California antiquity, in the completeness of its ruins, and its solemnly grand desolation under the wear and waste of time; bowing with awe within its once consecrated, but for many years unroofed and broken walls, with reverential feelings akin to that of standing in the spirit presence of the revered and self-sacrificing Padre, who founded the mission, laid the foundations of the church, and dedicated the structure to the service of Almighty God; and whose dust of mortality lies buried beneath where worshipers once knelt in solemn acts of devotion; and, also, since then—since its *transmogrification* into what it is at present—as much unlike the original as possible—*desecrated*—NOT *restored*. Its *high, steep, Gothic, redwood shingled roof*, and its modernized inside finish, wiping out and obliterating all semblance to the original, stone-arched, tiled roof, placed on it by the pioneer Padres of a century ago; the covering up and concealment from view, by plasterers' mortar or cement, the interior stone-work of the walls, which pleasingly illustrated the great care, regularity, and mechanical exactness with which the work was at first done, and many other departures from originality, simply reverses the order of things—the "restoration" being no less than the almost complete *ruin* of the once venerated *ruins*, thus exemplifying the entire unfitness of Father Casanova as the managing man, which position he seems to have occupied in the *modernizing* of the ancient edifice. If the reverend superintendent of the work understood the correct meaning of the term restoration, his practical demonstration of that knowledge has certainly produced a something as little like the original as can well be conceived, short of entire destruction, so far as his judgment and ideas of things have been reduced to practical execution.

The original *façade* of the edifice remains but little altered, as far as bell and stair towers, main entrance, and its peculiar Gothic gable window is concerned, but not so with the front wall itself; the sharp-pointed, Gothic gable rising many feet—perhaps near ten—above its original terminal, so mars and changes general effect that all preconceived ideas of the structure, whether derived from photographs or personal observation, are at fault.

A Lesson in Shop Management.

THE costly results of putting off till to-morrow that which not only can but ought to be done to-day are nowhere more surely felt than in a workshop. The number of failures in business which could be traced to this single cause no statistician will ever be able to compute. How in one instance the evil was pointed out and its consequences checked, is related by the *Cabinetmaker* as follows: We once worked in a shop where a specialty was made of builders' finish, brackets, mouldings, fancy finish, etc. About eight hands were employed in the room we worked in. The machinery consisted of railroad combinations, band and jig saws, panel and buzz planer, a boring machine, and a two-spindle moulder. The two planers and the jig saw had loose pulleys which were so badly worn as to necessitate throwing off the belts from the main shaft to the counter every time each machine was used. In that shop each man took an order from the order book, got out his stock, and finished the job, using whichever machines were needed. When it was necessary to use the panel planer, we had to climb up on the jig saw table and throw on the belt; when the buzz was needed, the planer must be used to stand on, in order to get at the requisite belt. If the planer was running, it must be stopped, thus delaying the man who was running it. One day after getting thoroughly disgusted, we "went for" the boss and asked him if he was going to have those pulleys bushed this year. He said he was going to "just as soon as he got time," but he let them run in this way for two whole months. One day we noted the number of times we had to throw on and off those belts. We used the planer fifteen times, the buzz ten, and the jig saw sixteen times, making forty-one times. It took about a minute to put on, and another one to throw off a belt, thus taking in all eighty-two minutes in one day. There were eight of us who had to do the same thing, so it took 656 minutes, or about eleven hours, to handle those belts—more than one man's time every day. Running this way for nine weeks would amount, at the rate of forty cents per hour, to $212, and our boss could not find time to have the pulleys fixed. We showed the figures to him one day. He scratched his head, took them into the office, and ten minutes afterwards came out, shut down the shop instantly, and sent those counters and pulleys to the machine shop. A loose pulley that rattles has not been seen or heard in that shop since. You may go into every shop in the land and six out of ten will have one or more of these "hand shippers" in operation. How is it in your shop? If the coat fits, put it on.

The Prompt Return of Plans.

AMONG the many office annoyances to which architects are subjected, that of bidders neglecting to return plans and specifications promptly at the time appointed for their return, is one of the most provoking,—alike to the architect, and the party who by appointment is the next in order to receive and use them. Each party figuring is entitled to the full period of his allotment of time and no more; and the one who by arrangement precedes the other, is in all fairness toward his fellow competitor, and the office which permits him to figure, in duty bound to observe his time privilege, and avoid encroachment upon the time and rights of the "next man," by the prompt return of plans and specifications at the understood or specially appointed hour. In all well regulated offices where business is conducted by rule and system, each bidder is allowed one or more days, according to the magnitude of the work to be figured upon, in which to complete his use of the papers; and when more time is taken by any one of those figuring, than the days or hours appointed to him, he takes—by encroachment upon his successor's time and rights—that which he is not entitled to, and does an unfair thing; for the time of the next bidder in the order of appointment is his own; and his predecessor in figuring is in honor and duty bound to so act his part that the other shall not be subjected to loss of time, nor to any other inconvenience through failure of the first to exercise due diligence in carrying out the understanding which usually in such cases exists. There can be no consistent excuse or palliation in such cases, short of *absolute impossibilities;* and the bidder who is careless and thoughtless in this respect, justifies suspicion on the part of the architect, that the same spirit of carelessness, and lack of promptness may develop, should the not particular one be the successful bidder.

Sometimes plans are delayed and held back for the purpose of shutting out multiplicity of bidders, and lessening competition. This may work in some cases, when circumstances preclude extension of time, but ordinarily such acts simply provoke, and result in the number of parties invited to figure being largely increased, or, as has been the case in some instances, an entire change in procedure, excluding entirely those so manipulating matters.

To the architect it is unfair; involving him in disappointments, and rendering explanations necessary to explain to his client the reason why the number of bids at the hour set for opening is less than had been requested, arranged, and fixed upon; thus rendering it possible for the owner to suspicion complicity somewhere, a result not beyond the bounds of reason when irregularities of the slightest character appear, particularly in cases of "first transactions," and with owners of quick discernment and perceptive minds, qualified by business experiences to take in and apply seeming, if not actual departures from strictly correct and business-like procedures.

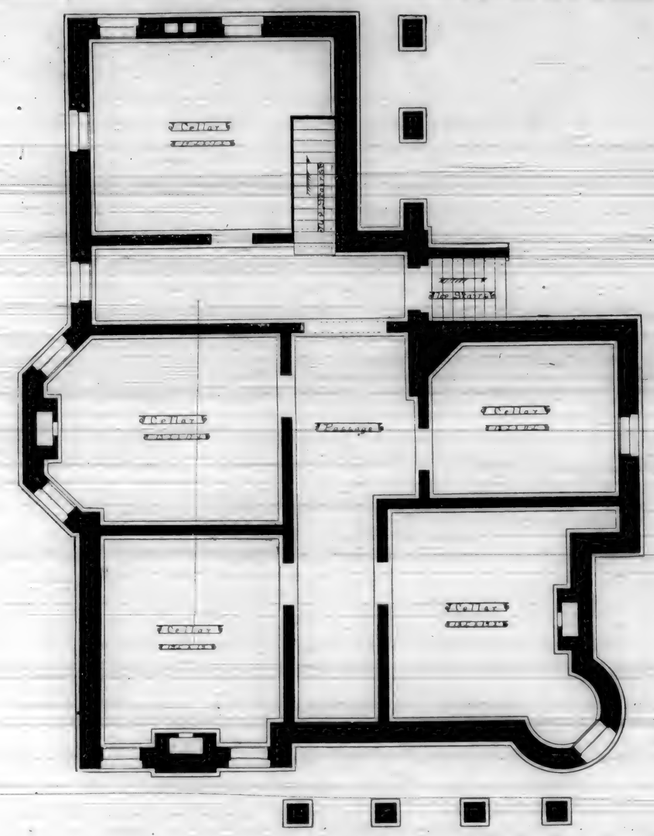
REAR ELEVATION OF $5,000 COUNTRY DWELLING.—4TH PREMIUM DESIGN.

For these and many other reasons, architects have good cause of complaint against such contractors as are negligent in the matter under notice, and all such will do well by correcting their business error in this regard. Promptness in all things, it matters not how trivial, is a good rule to observe, and is one that has characterized the lives of successful men generally.

High Buildings on a New Plan.

A NEW YORK architect has devised a new plan for erecting the high buildings which are coming so much into vogue in large cities. The design is quite novel. The plan is to first erect an iron frame and cover it with a roof as soon as practicable. The walls, of whatever material, may be built at the same time the structure of iron is being built. As the erection of the iron structure will proceed faster than the enclosure, there will be no cause of delay to steady progression while the structure is being built; the interior arrangements, as fire-places, vaults, archings for ceilings and lining for exterior walls, may be put in and ready for plastering by the time the exterior parts are finished. As the iron structure would soon be roofed the work could be carried on independently of the weather. Derricks could be placed on the roof for finishing the enclosure, and thus do away with unwieldy ones against the sides. The unusually broad piers now seen in buildings could be done away with, thus giving more space for windows on the lower floors, a thing greatly desired. The walls are to be supported by brackets, so that, if desired, any part of the exterior can be removed and repaired. The iron floor girders with the iron floor beams fastened to their sides, are attached to the outer posts at both ends, which will increase the bearing strength nearly one-half. A building built on this principle will combine elegance with security. A building of this description would be fire-proof as far as practicable for the best building constructed. Although they may be proof against catching fire from neighboring buildings, yet, when they are so filled with furniture and other combustibles liable to get on fire, would furnish smoke enough which might prove as fatal to many as flames have been in other cases.—*The Builder.*

Every property owner should subscribe for the "CALIFORNIA ARCHITECT AND BUILDING NEWS." It is the only Journal on the Pacific Coast published strictly to advance your interests. Only $2.00 per annum. OCTOBER, NOVEMBER, and DECEMBER numbers of this year will be given free to all new subscribers for 1885.



CELLAR PLAN OF $5,000 COUNTRY DWELLING.—4TH PREMIUM DESIGN.

Terra Cotta in Architecture.

ONE of the most marked improvements connected with the building trade in this country during the past decade, is the use of terra cotta, for purposes of architectural decoration. Ten years ago a majority of those engaged in our building trade did not know of its existence, so accustomed were they to simple brick work, painted wood, or decoration in galvanized or cast iron. Fortunately this aspect has changed, and changed for the better in more ways than one. Architects and builders now realize that in terra cotta they have a material at once beautiful, imperishable, and far less costly than a poor quality of stone, when worked into architectural detail. It is also a material that will enable them to utilize and harmonize local materials which, for obvious reasons, are often required to perform a large part in building operations. Terra cotta being composed of clay, is, by the action of fire, changed to a hard and brilliant substance; and by the judicious selection and manipulation of the clays fitted for terra cotta, work of any desired tint and color may be obtained.

It is generally conceded now that the wearing qualities of terra cotta are vastly superior to those of stone of any sort, and builders and those interested in building operations, will serve their best interests by looking into its merits.

The cuts on the opposite pages will serve to show some of the various designs which can be obtained in terra cotta. Any conceivable pattern can be made, thus insuring architects that their conceptions can be carried out in the minutest detail. Architects, as a general rule, can give the fullest information in regard to this beautiful material. Those living far off can only become acquainted with the grand improvements of the city through the agency of trade journals. Owners and others can obtain full particulars of cost, etc., of every description of terra cotta work, by addressing Gladding, McBean & Co., 1358 Market Street, San Francisco.

WHEN a saw has cracked near the teeth, to prevent its continuing, drill a small hole at the end of the crack. This is said to be effectual.

Burning of Barns.

IT is noticeable that a larger number of the burnings of barns is mentioned by the periodical press in the summer than at any other time. Some of the fires are undoubtedly caused by lightning, the moist vapor from the uncured hay making a favorable conductor for the electric fluid. But there are barn fires which cannot be attributed to lightning, to lighting of matches, to light from lanterns, nor to the invasions of careless tramps. It may be that the spontaneous combustion of hay is as possible as the spontaneous firing of cotton waste. All fibrous material, when moist, and compressed, and defended from the cooling influences of the outward air, is subjected to a heating similar to that of fermentation; and in some instances the degree of heat is sufficient to cause actual, visible combustion. In the case of recently "cured" hay this danger is as great as, in similar circumstances, other materials may be. Frequently the grass is cut in the early morning, while wet with dew; is turned twice during the day, and gathered and packed in the "mow" or the "bay" before nightfall, with perhaps a sparse sprinkling of salt. Such a compressed mass of fibrous, moist matter will heat. How far the heat will go toward generating a combustion may be inferred from a foolish trick which the writer witnessed several years ago. A large meadow of hay had been cut, cured, and cocked, previous to removal. A shower threatening, the cocks were covered with caps of canvas and left for the night. While getting the hay in, the next day, one of the workmen dropped an unlighted match from his pocket into a cock of hay, and in a few minutes it was ablaze. It afterward was ascertained that he had spoken of the warmth of the hay as he lifted it on his fork, when a companion remarked that it might be hot enough to light a match, on which he put a match into a rick, and before they had passed on five minutes the rick was on fire.

Everybody conversant with farm life, where hay is a permanent and important crop, knows that for weeks after getting in the hay the barn is warm when the doors are opened in the morning. There is an amount of heat that is absolutely unpleasant when the thermometer outside registers 60°, but which is quite welcome with the outside temperature at 40°. This barn heat is undoubtedly from the moist hay, compacted and inclosed. The cure for the possible danger of possible spontaneous barn burning would seem to be the thorough curing—drying—of the hay before it is housed. We dry all our herbs and some of our vegetables without injuring their peculiar and individual qualities. There is no reason why hay or other fodder material stored in large masses should not be rendered equally innoxious to the influences of heat by thorough drying.—*Scientific American.*

"NO, SIR," said a practical American, "no bric-a-brac on the mantel for me! It's a nuisance. Where's a man to put his feet?"

Designs and Estimates Furnished on Application.

Practical Graining.

In walnut graining there are many tones given to the finish through the ground-work to meet the various shades found in walnut woods. The red is the most pleasant, and for which a dark copper color ground is used. There is a slight negative to this, in a light reddish purple, made by adding Prussian blue to the previous ground. This tint is seen in some walnut and can be imitated with good effect by stippling with lighter color (water or oil). The color selected for a ground having been placed upon the work to be grained when dry, rub smooth with sand paper, and the work will be ready for stippling. The term stippling means to pounce with a brush endwise, or to flog and whip lengthwise with a flat painter's duster, or a badger hair blender. For distemper or water color use burnt umber for light stippling, and for dark add some vandyke brown. These colors are found in material stores put up in glass bottles. Mix the distemper colors in beer or vinegar to give it adhesiveness. With an ordinary paint brush put on the color over the work, only so much at a time that you can flog it before it dries.

The work when done, should show an even grain of stippling of the color, and uniform in its tone. When this distemper color is dry, it is ready for the oil colors. The amber in oil, thinned with a little turps and oil and with a drop of Japan to set the color; spread this color over your work with sufficient thickness to give a good walnut shade and only so much as you can grain before the setting color gets hard. In graining a door, the panels are done in walnut root, branches or heart growth. The mode prevailing now is to do the panel work in walnut root, the rails in sap growth, with plain wood grain for the styles. The root is worked in short whirling masses of dark color, waving round curling burls, or as seen in French root veneers like rivulets running over and around rocks in a tortuous course, with foam and splurges swaying its way in never ending struggle. It is a difficult wood to imitate, but as every effort to produce it makes a passable imitation it is allowed to pass, while future improvement in succeeding efforts will give more satisfactory results.

To grain in mahogany it is necessary to have a ground of venetian red, tempered with a little white lead. I think this beautiful wood is best imitated in water colors. Provide yourself with the burnt sienna in distemper, and proceed as in walnut to stipple the work, and when dry give it a light coat of varnish. It is now ready to receive the over-graining. For branches of this wood, you need a small piece of flat sponge; cut on one side teeth-like points of one-fourth to one-half inch apart, a stiff business card, a camel or badger blender. For panel branch put on the color, a very dark shade in the middle and light on the sides. Then wet the sponge slightly and commence to form the branch by taking out the lights by an upward movement of the sponge, holding the point toward the center, starting with point lightly, then heavy, forming a semi-circle, then draw the sponge down with a waving motion to the sides of panel edge. Having done one side of the panel, follow up the opposite side in the same manner. Then take the card, holding it edgewise, press it on the dark parts under the point the sponge has made; open sharp lights right and left from the center to give flashes from which the former lights spring. Follow with the blender and soften the work in an upward course until the harsh lines are all blended softly together. When dry take a bristle top grainer and fill with color so that you can draw it over the work from bottom to top across the panel. The bristles should not be too wet but just enough to make the lines even in the half circle movement from side to side. Blend quickly and give the lines an upward trend, while the dropping ends are joined by the blender to the sides in one whole mass.

The other parts of door where no grain is needed, can be put in waving light and dark lines blended so as to show the transition of light and shadow. The lower and upper rails can be done by laying the blender flat on the work and draw softly across, in waves and blend to finish. The twists and curls of the mahogany when too light add more color to give the necessary effect to the work; keep the blender dry by wiping and drying. Maple and ash woods require lighter grounds; white tinted with yellow serve as a ground for either of these woods. They look well in oil or water. The maple color raw sienna, add a little umber for ash. They are formed in their curls with the over-grainer and blender; the bird's eye is imparted by grouping the finger tips together and tapping the work here and there between the waving lines of the top grainer, after which blend softly to trend the eyes to grain one direction, more in line of the various curves. The following are samples of sap growth of the pine and the Hungarian ash

and French walnut burl work. The pitch-pine requires a light ground similar to oak, and grained as in oak and oil, using raw sienna, and burnt in nearly equal parts. Wipe out the lights as described in a former number of the CALIFORNIA ARCHITECT. The graining is something of the style of oak only a little sharper in the points of the heart growth. The southern pine of Florida has deep lines, and in tone the color is deep in burnt terra de sienna. In graining, the learner should consult the natural woods, to learn from nature her own forms, and imbue the mind with all their varieties, and thus be better prepared to imitate them.

J. E. W. C.

Concrete vs. Brick Floors.

THE designer of a certain warehouse in Germany, unable to find definite data of the resistance of such floors, resolved to make trials for his own information, and incidentally for that of his professional brethren. The warehouse was of immense size, covering nearly an acre of ground, and was intended for the storage, among other things, of heavy pieces of metal, the handling of which often involved considerable shocks to the floors. The whole building was fire-proof, part of the flooring being of brick arches in cement, between iron beams, and part of concrete slabs supported in the same way. Five trial floor arches were built, each 44 inches in span, of which the first consisted of concrete, made with one part Portland cement to five parts of gravel, while the second was of hard bricks in Portland cement mixed with three parts of sand, and was covered with a coat of asphalt three-quarters of an inch thick; the third was of softer brick, in mortar containing one-half as much lime as cement, and four parts sand; the fourth was of the same brick, in equal parts of lime and cement, and five parts sand; and the fifth was of the same brick, in cement alone, mixed with four parts sand. These last floors were finished with a coat of cement, three-quarters of an inch thick or more.

Fifty-four days after their completion, each floor was loaded with pig iron to the amount of 200 pounds to the square foot. This weight had no effect, and two days later the concrete arch was tested by letting fall upon it an iron ball of 60 pounds weight. This, dropped from a height of five feet, did no harm, and another ball, of 135 pounds weight, was let fall from the same height. The first blow produced no effect, but by dropping the ball repeatedly on the same spot a crack was started at the fourth blow, and the eighth broke a hole entirely through the floor, the opening being 4 inches in diameter at the top and 24 inches at the under side.

Thirty days later the same test was applied to another part of the floor, and a hole of the same size and shape was broken through at the ninth blow of the ball. The thickness of the concrete in the middle of the span was 4 inches. Trials were made of the brick floors in the same way. The first, of hard brick in strong cement mortar, stood forty-eight blows of the heavy ball before it was pierced; the second, of softer brick, with lime added to the mortar, gave way at the tenth blow; the third, at the seventh blow; and the last, of soft brick in sandy cement mortar, without lime, at the tenth. In all these cases the hole broken through was much larger at the intrados than at the extrados. A new floor was then built of soft brick, in mortar made with two parts lime to three of cement and ten of sand, and covered with a layer of concrete, of equal parts of cement and sand, 2 inches thick. After this had set, the floor required seventy-one blows of the 135 pound weight to break it through. This protective effect of the thick layer of concrete over bricks is very curious, but aside from this, the result of the tests was decidedly in favor of the brick arching.—*Selected.*

Soil as It Relates to Health.

BY GLENN BROWN, ARCHITECT, A. A. I. A.

IMPORTANCE OF THE SUBJECT.

AS OUR houses and homes rest upon, or have their foundations beneath and surrounded by the soil, it becomes important for us to know the dangers, if any, which may lurk therein. Hippocrates treated on the importance of pure air, pure water, and a pure *soil*, more than two thousand years ago. He considered the air the most, and the soil the least important of the three. Dr. Pettenkofer thinks their relative importance should be reversed. He concludes from recent observations and experiments, that the soil or ground has, when in a bad condition, greater evil effects than either air or water. He says that malarial and intermittent fevers originate in the soil, is already accepted. I think cholera, plague, typhus and yellow fever's source must be sought in the soil.*

The evils which lurk in the soil are the ground, air, and water, or more properly speaking the injurious germs conveyed by the movements of, or retained in the ground, air, and water.

DAMPNESS AND GROUND WATER.

The soil may be moist, or the interstices between the particles of earth filled with water and air, or the water may stand in the vacant spaces to the exclusion of air. All filth, vegetable or animal matter that may soak or be in such soil, will undergo purification or oxidation but slowly, as the free circulation of air is cut off by the water.

The Romans were evidently aware of the importance of subsoil drainage.

The archæologist De Tucci called attention to some underground channels in the Roman hills called "*cuniculli*." These channels were examined by Tomassi Crudelli, and found to be exclusively for the purpose of draining the hills. He states in his recent work on the subject, that the ancient Romans suffered much less from fevers than those did who lived in Rome after the drains were destroyed by the invading barbarians, and less than the Romans of the present day suffer.

The above mentioned drains were not described by ancient authors, probably because of their common, every-day use.

By investigation in damp and marshy districts, and in districts either naturally or artificially drained, such physicians as Drs. Buchanan, Haviland, Seaton, and Fenton, of England, came to the conclusion that dampness in the soil is an important cause of pneumonia, phthisis, and like diseases.†

Dr. Bowditch, of Boston, concludes from written statements of resident physicians in 183 towns, that dampness of soil in any township or locality is intimately connected with the prevalence of consumption in that township or locality.* Dr. Josiah Parkes, of England, in his excellent work on "Practical Hygiene," and Dr. J. H. Ford, of Philadelphia, in his article on "Soil and Water" in Buck's Hygiene, enumerate many instances which tend to prove the important relations between the soil and our health. They conclude that, beside the diseases mentioned, a damp or saturated soil predisposes to rheumatism, catarrh, and neuralgia.

Mr. E. F. Bailey-Denton says: "Wide agricultural districts containing isolated dwellings have been so much benefited by drainage that diseases which in former times constantly prevailed have now ceased to exist."†

Water lowers the temperature; this in itself has sometimes an injurious effect. Water can only escape from a water logged soil by evaporation from the surface. The amount of heat, or power lost, in evaporating water from a wet soil, is appreciated by but a few. The experiments of Rankine and Josiah Parkes show that thirty inches of rain yearly falling on an acre of land, would take more than 18,590 pounds daily evaporation to exhaust it.‡ To obtain the same results with an ordinary steam boiler, would take 2,400 weight of coal. For every grain of water evaporated, heat is required sufficient to raise 960 grains 1° Fahr.

The experiments of Prof. Schublet, at Tubingen, also proves the effect of ground water on the temperature of the surrounding soil and air.

"Drainage contributes to the dryness of the soil, and improves its temperature, not only by diminishing evaporation and increasing the hygroscopic powers of the soil, but by increasing the power to absorb the heat."—*Ford.*

The influence of temperature upon the causation of disease is undoubted. Ground water often forms conduits and becomes receptacles for excreta from cess-pools and sewers, and decayed matter from made ground or cemeteries.

In cases of this kind the interstices between the particles of soil become charged with excrement or decayed matter, and the ground air filled with germs. To quote Mr. Simon's words, the earth would be "excrement sodden, and the air excrement reeking."

THE GROUND AIR.

The character, movements, and effects of ground air have been only recently, and in a limited degree, investigated.

Its importance has been shown by the experiments of Profs. Renk and Pettenkofer, with the aid of Ricknagel's differential manometer. Professor Renk found that there was a current of air from the ground into the house for the greater part of the year. This current was found to carry dust, or small particles of matter, organic, mineral, or otherwise, of which the earth was composed. Other observers have shown, according to Pettenkofer, that this ground air carries germs susceptible of development in suitable solutions.

The effect which the wind has upon the ground air is clearly shown by the following experiment of Pettenkofer.

He takes a long glass tube closed at the bottom and fills it with gravel. Into the axis of this tube he inserts another smaller tube, open at both ends and reaching nearly to the bottom of the large tube. The second tube is attached by a piece of rubber tubing to a glass. V-shaped or trapped tube, which is partially filled with water. (See Fig. 1.) "If a person blow, as represented in the figure, on the surface of the gravel, the liquid in the V-shaped tube will be seen to alter its position, the level side next to the person who is blowing, becoming lowered, and the other proportionately elevated. The depression of the fluid is caused by the air blown through the gravel, because it ascends from the bottom of the

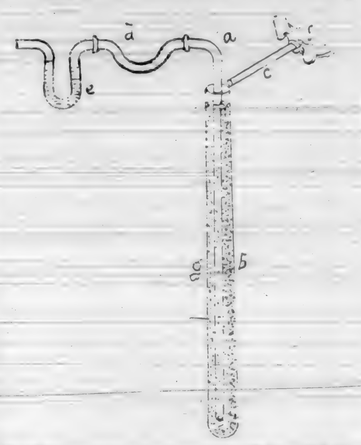

FIG. 1. Pettenkofer's Experiment, (a) small tube, (b) large tube filled with gravel, (c) tube with party f blowing through it, (d) rubber tube, (e) bent or V tube with water in it.

gravel through the small tube, passes through the india rubber tube, and thus reaches the water."

If a candle is placed at the mouth of the V-shaped tube, the water having been removed, the flame of the candle will be pressed aside by the current of air. From the experiment it can be easily understood how the ground air is continually moving by the action of the winds on the surface of the ground, or by the state of the atmosphere.

Artificial heat creates a vacuum and draws or sucks the air into the house unless it is properly protected. In this way air may be brought from some distance through the ground into the house, and impurities which exist near or beneath the house, may be easily conveyed into the house by this means.

(To be Continued.)

WHAT will clean zinc and make it look bright? *A.*—Whiting or refined chalk in water; finish dry.

A New Idea for Boys.

BY ALLAN FORMAN.

THERE is hardly a boy who does not enjoy working with tools, and "building things," as the expression is. Of course there are some boys who are naturally ingenious and handy in various kinds of mechanical work, and there are others who do not even know how to drive a nail—an operation by no means so simple as it seems—yet they all want to learn.

Occasionally a boy will have the good fortune to find favor in the eyes of some obliging carpenter who is willing to allow him the use of the shop bench and perhaps even some of the tools. But this is always the clever boy who obtains these privileges. The clumsy boy must go on driving his nails sideways, and cutting his fingers with his chisels, until he becomes disgusted with mechanical work.

There have been several schools for mechanics established in different parts of the country, but none quite on the principle of the Gramercy Park Tool-house Association, which will begin operations in New York this autumn. This is really an association of boys in the form of a stock company, governed by mutual agreement, as any similar organization, and joined together for the purpose of maintaining a well-stocked tool-house, and providing suitable instruction in the use of tools.

Carpenter's tools of the best quality and most approved patterns will be provided from the fund, and the boys will not only be taught how to use them, but, what is even more important, how to keep them in order. While the pupils will be allowed to follow their own choice in the kind of work they do, they will be advised by the superintendent, and the products of their industry and genius are to be disposed of at auction at the end of each term, for the benefit of some charitable institution.

The shares in the association are, of course, really paid for by the parents of the boys, but the theory of self-government is carried out as if they were the *bona fide* owners of the stock. This principle of self-government in itself is an excellent thing, for it teaches the idea of individual submission to laws, which are perhaps distasteful, for the public good.

As to the main object of the association, the idea cannot be too highly commended. There is nothing which is so useful to a man in after-years as some knowledge of mechanics, which can be easily acquired in boyhood. How many a man envies his neighbor his ability to tinker a broken lock, or to arrange without apparent trouble those thousand and one little conveniences that a "handy" man enjoys making for the benefit of his household!

The use of tools teaches a boy any number of other things which are useful to him all through life. He learns much of the great principles which underlie the science of mechanics. It teaches him to be accurate in his measurements, to be careful and neat in his work, and it fosters a taste for the higher mechanical pursuits; and—an argument which always appeals strongly to parents—it gives the boy a place where he is enjoying himself, yet at the same time he is learning something which will be of advantage to him in future.

But the Tool Association is not confined to carpentry alone. Moulding and casting in plaster and clay, elementary chemistry, geology, and microscopic investigations, will form a part of the interesting work they have laid out for the coming season. The tool-house and laboratory are thoroughly stocked with tools and instruments. Practical mechanics have been engaged to overlook the work of the boys, and the whole will be under the direction of Mr. G. Von Taube, the originator of the scheme, who will advise with the young stockholders, and see that the rules are carried out.

A boy who could not pass many happy hours in the association's pleasant work-room must be hard to suit. The only pity is that such schools are not started in all the large cities. There can be no doubt that they would become popular.

Brass for House Interiors.

BRASS, from its composition, can only be used in the interior of buildings, and should not be exposed to damp. Its natural pale yellow color is very agreeable, and is due to the presence of zinc. It is not highly malleable, but may be cast and treated like bronze, or by a process of annealing rolled into thin rods and sheets, and worked up in the same way as iron. It is difficult to give a decided preference to either method, though they are so totally opposed in principle and practice. The present tendency is in favor of wrought brass, welded, beaten, pierced, hammered and riveted as in iron; for this exhibits the individual skill of the handicraftsman, and possesses a sentimental value that cast work, which can be produced *ad libitum*, cannot possess. The designs should be more severe and precise than if intended for forged iron, and more pierced and embossed work should be introduced. It should be sparingly used, and the redundancy of polished brass in some of the newest restaurants in London, though affecting to be the quiet and unpretending style painted by Hogarth, is vulgar. The works in ormolu, of Luis XV., and Louis XVI., which are of cast and chased brass gilded, are too beautiful to afford any scope for adverse criticism, but objects designed to be cast in brass should either be of great delicacy or great simplicity. Though the arts for working in at least what are called base metals are not yet in the position their importance in the past and in the present entitles them to, the future is full of hope, and we may trust that a time is at hand when men of exceptional power, though engaged in what have been regarded as the humblest industries in which art can enter, will be able to impress the seal of their genius on their work, and hand their names down to posterity.—*Builder and Wood-Worker.*

Make Your Own Gas.

OWNERS of country stores and dwellings should use every precaution against fire, as the non-proximity of fire engines and scarcity of water oftentimes cause a small fire to develop into a disastrous conflagration. Since the first introduction of coal oil as a means of illumination, various contrivances have been placed in the market, by which gas could be manufactured from that substance. For more than twenty years improvements have been made in gas machines, until there has been developed one that is as near perfection as scientific study and investigation can produce.

These machines are guaranteed absolutely safe in their operation, simple in construction, not liable to get out of order, and require no skill to manage. They require less attention than a common kerosene lamp. *No fire is used in the process of manufacturing gas by these machines.* Cost of gas will be less than one dollar per thousand feet.

The tank, containing the gasoline, is buried in the ground and is delivered in permanent pipes and fixtures to the proper distributing points. Consequently, no danger or trouble is engendered by frequent removals of the fluid. Full particulars in regard to these machines will be given by addressing A. F. Nye & Co., 609 Market Street, San Francisco, who are the sole agents for the best machine manufactured.

Queen Anne Hodge-Podge.

Architect—Well, I declare that is a pretty fair house plan for an amateur, only you have left no space for stairways and closets. Did you make it yourself?

Prospective Builder—Yes, but the only thing that puzzles me is to know what style of cottage it is. It is not Gothic, nor Italian, nor—

"No, it is absolutely nothing. As to style, it is simply a meaningless hodge-podge, to be frank with you."

"Well, what shall I call it, have you no name for hodge-podges?"

"Oh! yes. We call 'em Queen Annes."

A RECIPE for acid compound that will restore worn or blunt files to utility. Clean the files by brushing them clean of dirt and grease as well as any foreign metal sticking in the teeth; then dip in a strong alkali for a few minutes to remove all traces of grease from the bottom of the teeth; rinse in clean water, then dip a solution of 1 part nitric acid, 3 parts sulphuric acid, to 7 parts water. Time 5 seconds to 5 minutes, according to cut and wear. Rinse in warm lime water, dry, and oil slightly. Finally brush with powdered charcoal to take off excess of oil and give them the peculiar look of new files.

POWDERED glass for making glass paper, filtering varnishes, and other purposes, may be made by heating a piece of glass red hot and plunging it into cold water; it will immediately break into powder. This must be sifted and dried.

Angelo's High-Spiritedness and Separation from the Pope.

POPE JULIUS II. commissioned Michael Angelo to erect a mausoleum. When he showed it to the pope his holiness inquired the cost of such a splendid piece of work. Michael answered that it would amount to a hundred thousand crowns; and the pope liberally gave him to expend twice that sum. The mausoleum was commenced. Pope Julius was so delighted with it that he had a covered way from his palace erected, that he might visit the artist at his work *incognito*. This was too great a favor not to excite the envy of a court. Ill words and unkind slanders were spoken of Michael. They reached the ears of the pope, as it was intended, and he visited Buonarroti no more. Michael came to the vatican, which had been at all times open to him; but it was not so now. A groom of the chamber stopped his entrance.

"Do you know to whom you speak?" asked the indignant architect.

"Perfectly well," said the man, "and I only do my duty in obeying the orders my master has given me."

"Then tell the pope," replied Michael, "if he wants me he may come and seek me elsewhere himself."

The insulted artist returned immediately to his house, ordered his servants to sell his furniture, and follow him to Florence; and left Rome that very night. Great was the pope's consternation. But it was too late; he had already passed the boundary of the pope's jurisdiction, and force was of no avail. The couriers reached Florence and delivered the pope's letter. Michael's answer was this: "I have been expelled from the antichamber of your holiness without meriting disgrace; therefore I have left Rome to preserve my reputation. I will not return as your holiness commands. If I have been deemed worthless one day, how can I be valued the next, except by a caprice alike discreditable to the one who shows it, and the one to whom it is shown.

Julius next wrote to the Government of Florence, using the conciliatory words: "We know the humor of men like Michael Angelo. If he will return, we promise that none shall offend him or interfere with him, and he shall be reinstated in our apostolic grace." But Michael was inflexible. Again and again the pope wrote, and still this proud and high-spirited man refused to heed him. At last the chief magistrate of Florence became alarmed. He sent for the artist, and said, "You have treated the pope as the king of France himself would not have dared. We cannot bring him to war against the State on your account; therefore you must obey his will." The magistrate promised also, if Michael feared for his personal safety, to send him as embassador to Rome, in which case his person would be inviolable. At last Michael relented, and met the pope at Bologna. Julius glanced at him with displeasure, and did not for some time deign to speak. At last he said, "Instead of your coming to us, you seem to have expected that we should wait upon you." Michael answered with a slight apology for his conduct, which, however, was so haughtily expressed, that the prelate who had introduced him, thought it necessary to observe, "One must needs make allowance for such men, who are ignorant of everything except art."

"Wise and generous too," was the pope's indignant reply to this speech. He turned to the prelate: "Foolish man, it is thou who hast vilified Michael Angelo; I have not. He is a man of genius, and thou an ignorant fellow. Depart from my sight this moment." And the contemner of art was forcibly driven from the room.

WHILE the inspirations of the study and practice of the science of architecture should, and in its purity, nobleness, and truthfulness is calculated to, ennoble and elevate the minds, and purify the acts and life principles of those who in these latter days profess to fill the places, as students, disciples, and representatives of the art sublime, the grand master spirits of past periods, who conceived, delineated, and reared those grand structures which have withstood the ravages of time, the elements, and physical forces and conditions through ages, reaching back through decades of centuries, and which may continue to stand until

"The cloud-capt towers, the gorgeous palaces,
The solemn temples—the great globe itself;—
Yea, all which it inherits shall dissolve,"

Yet in these modern times, the elementary and fundamental principles of true architectural science,—*order, harmony, truth*, and *purity*,—are not universal rules controlling and regulating the hearts, practices, and purposes of *all* those who have found or forced their way into architectural paths.

The profession, high and honorable as it is in character and teachings, is encumbered with much of the smallness and sordidness which finds place in avaricious, ignoble, and unmanly minds, with whom professional dignity and fair dealings, are but subserviants and incidents to be utilized in pretenses, for the consummation of unjust and concealed designs.

This manifestation of human weakness or positive baseness is more or less distributed all over Christendom, with more prominent outcroppings in some places than in others. And while in San Francisco there are many in the profession who would disdain to do an unprofessional act, there are also many whose career and practice is unsanctified by a single impulse, or principle inspired, controlled, or regulated by any high or exalted sense of right or honor toward others. Extreme selfishness, one of the very meanest dispositions of the human mind, that which, more than any other, perverts and demoralizes the finer impulses of the heart, and holds in subjection and crushes out from the acts and deeds of common life every tendency toward "doing to others as ye would that others should do unto you," is the impelling force—the pre-eminent rule of action, which blinds the eyes and stultifies the senses against seeing or recognizing wrong or dishonor in any act or deed which hold out the promise of gain and advantage, be the injustice to others, or the baseness of the act what it may.

It is painful to the better men of the profession that this should be, and is true; yet true it is. And so long as men of inferior qualifications—men who possess no practical or professional abilities in any reasonably fair degree, their success being altogether the result of brazen cheeks and tongues, never so well in time as when ringing out false pretenses for themselves and as false insinuations in regard to others, "the latchets of whose shoes they are not worthy to unloose"—meet with favor, and are accepted by owners as—as what? Men of ability, worthy of confidence and trust? No; these are but presumptive considerations, entertained only, if at all, as among the possible things; while the controlling and influencing factor is found in the impossible-to-be-honest prices at which "professional" services are offered; which, followed up by the shrewd manipulation of words and expressions—sometimes cunningly devised, and at other times so bunglingly presented that any one of fair intelligence, not blinded by the *delusion* of *cheapness*, would be able to discern and penetrate the deception.

It is not an agreeable performance of duty to make these assertions, but it is far less pleasant to be forced almost daily to become acquainted with facts justifying all and more than the language used expresses; relieved only by the other fact that the profession in its purity of principle, purposes and honest practices is beautiful and to be admired, and that there are many worthy architects in all cities who prefer the enjoyment of profits honestly acquired to the accumulation of greater wealth by means not in harmony with the rules of strict integrity.

Bancroft's Histories.

THIS magnificent work embraces a complete history of the Pacific States. The territory covered is the western half of North America, from Panama to Alaska, including all of Central America and Mexico, and is equivalent in area to one-twelfth of the earth's surface.

There are to be thirty-nine octavo volumes, with maps and illustrations, fifteen of which are now ready. They will be well printed on good paper, neatly and substantially bound, uniform in style, and will average over 700 pages each. Three or four new volumes per annum will appear until the entire series is completed. Subscribers will not be obliged to take the work unless it corresponds with the description in every particular.

	PER VOLUME.
Bound in Extra, English Cloth, neat and attractive style	$4 50
Bound in fine leather, Library style	5 50
Bound in half calf, half Russia, or half Morocco	8 00
Bound in Russia Leather or Tree Calf	10 00

Any information in regard to the above will be given by addressing the office of this Journal.

Public Laundries and Baths.

THE establishment of public laundries and baths for the accommodation of the poor is an important means of promoting the public health, and, therefore, deserved to be encouraged, if not supported by the local Government. The housing of the poor is not the serious question here that it is in most European cities. Comfortable homes are provided in great numbers, which have the necessary conveniences for cleanliness and domestic work, but they are not within the reach of large numbers of the population, who have to content themselves with accommodations of the most inferior kind. One or two rooms must suffice for a family. The washing of clothes, cooking, and all other domestic work is performed in the apartments used for living and sleeping. Under these circumstances, home comforts are banished, and health—the main dependence—is jeopardized. For such people, the public laundry and bath would be a great boon. The disagreeable operations of washing and drying clothes could be transferred from the dwelling and sleeping apartments to an establishment fitted up with every convenience to facilitate the work, to which the wife could have access a certain number of hours, upon the payment of a small fee. The moral effect of extending such a privilege to the poor would be very great.

The public bath system admits of a still wider field of application. Wherever a swimming-bath has been established, its extensive patronage proves the need of such accommodations. Swimming-baths should be established not only as promoters of cleanliness, but as excellent means of healthy exercise. It would be well if these aids to health could be continued the entire year, but when this is impracticable they should be substituted by private baths, which should be placed within the reach of the poor by charging only a small fee. The Badeanstalt, established this summer in Cologne, one of the most complete and largest on the continent of Europe, is an illustration in point. It contains a workman's swimming-bath, the charge for a bath being not over three cents. The supply of water is continuous. Men following dirty employment are compelled to perform a preliminary ablution with soap.

The public baths in Germany are probably more elaborate and complete than anywhere else. In all the principal towns these conveniences have been opened or are in course of erection. The same may be said of England. Public baths are now being built in Dublin at a cost of $25,000. France is not behind her neighbors in providing for the wants of the people in this respect. Swimming-baths are found in towns, large and small, standing on the banks of a river, and their use is in some cases gratuitous, while in others a small charge is made. In our cities the same liberal provision has been made for the wants of the people. It is not needed in the case of persons in comfortable circumstances, as they can afford to have and do have private bath-rooms in their homes. But the poor suffer in their health from being deprived of the advantages of the bath, and for them provision should be liberally made.

The cost of the erection of these establishments need not be great, and that of their maintenance would be trifling compared with the benefits bestowed. The obligation of the municipality to incur such an expense is derived from the duty to use every reasonable means for the promotion of the health of the people. What has already been done in this matter has been very successful, and encourages renewed efforts to extend the system to its widest and most useful application.

What Constitutes Good Mortar.

MACHINISTS and engineers often have occasion to use mortar, and will value the appended information: Good mortar is a solid silicate of lime, that is, the lime unites with silica or sand to form a silicate of lime. In ancient days those who had some conception of the way the two things united superinended their mixing; but now-a-days anybody is supposed to know how to make mortar, while nobody knows much about it. Dry lime and dry sand laid together or mixed and kept dry for a thousand years would not unite to form silicate of lime any more than acetic acid and carbonate of soda dry in a bottle would effervesce. To make silicate of lime just as good as was made by the Romans, all that is necessary is to proceed intelligently. Procure good caustic, *i. e.*, fresh-burned lime, and if you find it all powder, *i. e.*, air-slaked, don't use it; use only clear lumps. Slake this (if possible in a covered vessel), using only enough water to cause the lime to form a powder. To this while hot add clean sand, not dirt and loam called sand, but sand—and with the sand add enough water to form a paste. Then let it lie where it will not become dry by evaporation—in a cellar, so much the better, for as soon as you have mixed the sand and lime as above, they begin to react one on the other, and if not stopped by being deprived of moisture will go on reacting until silicate of lime (as hard as any silicate of lime ever was) is formed. But if you take this so-called mortar as soon as made and lay bricks with it, unless the bricks are thoroughly wet, you stop the formation of silicate of lime and might as well lay your bricks in mud. Lime and sand, after being mixed, might lie two years with advantage, and for certain uses, such as boiler setting, or where the whole structure of brick and mortar is to be dried, the mortar ought to be mixed for one year before use, and two would be better; but for house building, if the bricks are so wetted as not to rob the mortar of its moisture as soon as used, mortar that has been mixed a month will form good solid silicate of lime among the bricks it is laid with in ten years, and will be still harder in a hundred years. The practice of mixing mortar in the streets and using it at once is as foolish as it is ignorant, and would be no improvement. Silicate of lime is made only by the slow action of caustic lime and sand, one on the other—under the influence of moisture. Dry they will never unite, and mixing mortar as now mixed and using it at once, so as to dry it out and stop the formation that the mixing induced, is wrong.—*The Builder and Wood-Worker.*

In the Style of Queen Anne.

LET me offer a few reflections on the mania for Queen Anne houses that is now rife, and which I venture to pronounce a failure, and which, with more certainty, will be decreed a failure a generation hence. The thing is all wrong and on wrong principles. The Queen Anne architects indulged in no such ridiculous, fantastic freaks as we see now exhibited, and simply because such was entirely opposed to the nature and character of brick. Brick is a simple, honest, plain material, with a good color and hard, smooth surface—that is all. Whatever style can display these qualities best is the Queen Anne style and no other. The result of the modern caprices will be seen ten or twelve years hence, when certainly decay will have disintegrated or destroyed the whole, or when the owner's heart will have sickened of the frequent repairs and restorations. The old Queen Anne houses produced effect by the beautiful color and surface, the bricks being laid almost touching, with the thinnest wash of mortar between. The result is that no rain or damp ever gets between. The modern system of building is opposed to this, thick layers of mortar being interposed with the certain result that all the elaborate gables, etc., soon begin to separate. Bricks put together in elaborate forms have no strength, no more than stones laid on earth, but displayed in surface it becomes as firm and smooth as a billiard-table. Even *mouldings* should be raised in the faintest degree, and the less they are the richer the effect. There is an old house out at Clapton, a "seminary for young ladies," that for design, simplicity, and pure brickwork, mixed with stone and design of outline, puts to shame all the brick phantasmata that are now covering the city. Looking at the pretentious masses that cover the new settlement of Cadogan Square or line the Embankment, one does not feel at all drawn back to the days of Queen Anne. There is a coarse, raw treatment in their embroidery, to which the brick lends itself but reluctantly. The material is too rude for such fine work. There is another fad in house adornment, which, it may be said, has run its course. This was the daubing over houses "liver-red," green, blue, etc. These efforts looked daring enough at first, but presently, as the dirt accumulated, they turned all kinds of horrid tints, and the house looked dirtier and shabbier than ever. —*Tinsley's Magazine.*

OCTOBER, NOVEMBER, and DECEMBER numbers of this year will be given free to all new subscribers for 1885.

Strength and Wear of Building Materials.

THE question of the rapid crumbling and disintegration of mineral building materials, is one that architects and builders throughout the entire country should be interested in.

A sample of material may respond favorably to all the known tests to determine its strength and elasticity, and still show evidence of short life when placed in the walls or foundations of a building. Especially is this true as regards stone. To begin with, when we estimate the value of any variety of stone for any specific purpose, we must keep in mind the circumstances and conditions around and under which it is to rest, and do service:—

1st. In the average climate of America it will have to bear in the direct rays of a July sun, a heat of 120° Fahrenheit on the outside, while inside it may not be more than 70° Fahrenheit.

2d. In winter it may be exposed to an exterior temperature of 20° Fahrenheit below zero, and an interior heat of 70° Fahrenheit above zero, or 90° of difference; and though mathematics are of no aid in enabling us to determine and point out that fine point where these opposite forces of contraction and expansion meet, that we may partially provide for it in the upward and downward pressure, it amounts to the most gigantic force known, which has an effect in destroying the molecular cohesion of the particles constituting the stone. It must give to one side or the other under the enormous force applied on that side, and reversed on the other, besides the great pressure to which it is constantly subjected by the stone above, and the resistance afforded by every stone from the very foundation until it is reached.

3d. The great majority of building-stones show upon analysis traces of calcium, terrous oxides, etc. The larger number of buildings constructed of stone are located in cities and towns where coal is used for fuel, the fumes of which coming in contact with an atmosphere already impregnated with other elements, form those acids and gases, which uniting with the elements of the stone cause disastrous results.

It is no wonder, then, that immense walls, apparently compact and homogeneous, open in cracks, split off in layers, and burst in pieces.

4th. A stone newly taken from the quarry loses in weight by exposure by the evaporation of its natural moisture; this leaves all these minute interstices or pores invitingly open to rains and atmospheric moisture; hence when the frosts of our nothern winters come, it is no wonder so many walls are out of line, and unsafe without repairing or renewal. This force of frost during the past winter, even in the South, puts to shame the power of a Corliss engine or hydraulic press.

The dilapidation produced by alternate freezing and thawing; the changes from protracted droughts to incessant moisture; from excessive heat to cold; the difference of temperature at the same moment between the opposite sides of the same block, the tendency to split off, and the lamination of unequal densities, and many more, are all grave obstructions to the use of building stone in this climate that would sink into comparative insignificance in other countries.

That many buildings become unsafe, and innocent persons get the blame, there is not the least doubt. A magnificent structure falls with a crash, the builder is berated, the architect censured, when if the truth was known, in many instances the silent, subtle influences mentioned above had been at work, and no one was to blame.

Before proceeding farther with our discussion, we will consider the condition of material under pressure, and subjected to tension.

If we take a piece of wood, and carefully estimate the force required to tear it asunder, we will notice that lengthwise of the grain requires the greatest force. If we subject it to pressure across the grain, for every degree we bend it we find this resistance increased 11.617 per cent. (an average of thirteen varieties of wood tested), increasing in direct ratio until sufficiently bent to displace its molecules, when, of course, its strength decreases rapidly. Timbers, then, subjected to a certain tension in a building will outwear those not subjected to it. Again, a timber bearing a certain number of tons of weight for a certain length of time, will bear a much heavier weight without being unsafe, than if the timber having lain idle, as it were, should afterwards be loaded. This increase of strength is quite striking, as may be proved by the following experiment:—

Three pieces of some brittle wood, carefully made of equal size, are placed side by side, with the ends resting on some firm base, and on one is placed 100 grams, and on another 500 grams, and they are then left for a week or more in a warm, dry situation. The one bearing the greatest weight will have bent the most, and will bear more added weight than the more lightly loaded piece, while the same weight placed on number three will break it. This proves conclusively that a certain weight placed on a timber, renders it capable of bearing one still greater subsequently. A timber with all it will bear without displacement, will actualy bear more additional weight subsequently, and keep on increasing in both its wrenching and tensile strength than if it be laden one-half as heavily at the outset.

Viewed with the microscope we find that the instant wood is bent out of the true the fibres become closer at the bend or angle. Now if the pressure is continued just far enough to bring these in actual contact without force sufficient to mar or bruise them, they adapt themselves to the situation, and are absolutely *glued together* by the gummy substances liberated by the cells ruptured in the bending.

Furthermore, timbers subjected to pressure will decay less rapidly than when not. A stick of lancewood bent double, and the ends made secure, and the same exposed to the influences of decomposition will show the effects much sooner in those portions not bent, than where the sharp angle appears; moreover, a stick actually broken in bending will not rot so soon at the break as at some distance from it, and fungous growths rarely appear at the point of bending as soon as elsewhere.

At first sight it would appear that, subjected to constant pressure, wood would undergo the same change as iron, but experience has demonstrated the contrary. In some of the ancient ruins of Europe we notice this fact: that those portions which apparently sustained the greatest pressure, such as roof-trusses, gables, etc., were in a much better state of preservation than the joists which were merely supports for nailing, etc. All who have visited "Duckey Hall" in Lincolnshire, will recall, perhaps, in the east wing of those massive ruins, some bits of curved cornice apparently in an excellent state of preservation, while all around has long shown evidence of advanced decay. For a long time it was supposed that this round coping was of metal, but when a few years ago this wing or tower blew down it was found to be a species of deal, which had been forcibly bent and secured while green,—probably, at the time of the building of this castle, little if anything was known of steaming,—and when these boards were released from the pressure to which they had been submitted for centuries, they began to take their original or straight form; of course, but partially; nevertheless, the ends sprang apart nearly an inch when liberated, showing conclusively, that with all the influences which had been at work destroying the adjacent woodwork, these boards subjected to this pressure had not lost their power of attempting to return to their original shape.—*J. F. E., in The American Architect.*

Drilling Holes in Glass.

FOR drilling holes in glass, a common steel drill, well made and well tempered, is the best tool. The steel should be forged at a low temperature, so as to be sure not to burn it, and then tempered as hard as possible in a bath of salt water that has been well boiled. Such a drill will go through glass very rapidly if kept well moistened with turpentine in which some camphor has been dissolved. Diluted sulphuric acid is equally good, if not better. It is stated that, at Berlin, glass castings for pump-barrels, etc., are drilled, planed and bored, like iron ones, and in the same lathes and machines, by the aid of sulphuric acid. A little practice with these different plans will enable the operator to cut and work glass as easily as brass or iron.

DRYING WOOD IN SAND.—An Eastern contemporary says that small pieces of wood, such as are used by joiners and furniture makers, can be readily and effectually dried by being placed in dry sand, and then heated to 100 degrees. By this process the sand acts in the manner of an absorber of the moisture, as well as a diffuser of the heat, and the effect is uniform and complete.

"ENGINEER full; boiler empty;" is the way Western paper accounts for an accident.

More Conumdrums.

WE have an invalid in our family, who needs of all things, through the summer months' the free air of heaven. She cannot even climb the stairs to and from her own room in the second story.—Can you tell me if it would look badly to have an upper room, detached from the main building, open on all sides, but connected with the house by a bridge or something of the sort? Hanging balconies are very well as far as they go, but I want to get further away from the house, so that we can look out in all directions. I have never seen anything of the kind, but should think it might be done. Yours truly, ——.

To the main question, whether such an elevated external attachment to an invalid's chamber would look bad, we can only say it would depend. We can imagine situations where a magnified marten box standing on posts, a few feet, more or less, from the house, would be an entirely agreeable-looking affair. Probably in most cases it would be best to make some use of the first story as well as of the second, although, if it happened to be where the ground below was needed for a walk, a drive, a flower-bed, or some such purpose, there could be no objection to its standing upon its four bare legs, like any other independent quadruped. Probably the most satisfactory plan for it would be upon one of the southerly corners of the house, say the northeast corner of the balcony, or whatever you call it, contiguous to the southwest corner of the main house, like two black squares on a chess board. This would not seriously interfere with the outlooks from the main windows.

While you are about it why not make the connecting link a draw-bridge, so that your invalid, after taking possession of the premises, could pitch her pill boxes overboard and snap her fingers at the doctor?

Do they make rooms without sills to the doors? Ours are a great nuisance.

The raised sills, or thresholds, whatever they may be called, meaning the piece of wood laid on the top of the floor underneath doors, may be, and often are, very properly omitted. You are quite right in thinking the high barrier between adjoining rooms a great nuisance. Of course you cannot allow a door to fit as closely to the floor or carpet as it may to the top of the raised threshold, it would not swing freely and when hung upon hinges at one side a door will sag after a time if not supported when shut. The latter fault can be guarded against by fixing a small rest of metal, or hard wood, near the jamb opposite the hinges, which would be no more unsightly than the other door trimmings, and the crack underneath is not a serious defect, unless you are very much afraid of spiders. Sliding doors are usually best hung at the top, avoiding the track on the floor; and thresholds, if used, should not exceed half an inch in thickness.

Would it be practicable to have one side of my sitting-room entirely of glass and so constructed that it could open out in summer like a roof? In that case could I have an outside stone floor level with the floor inside?

The chief objections to building a house on the flap or awning principle, that is, with the entire broad side of one or more rooms hinged at the top, and so made that it could be raised into a position nearly horizontal, would be the expense of the machinery required to move it easily, and the extra labor of building the movable sides in such shape that they would be satisfactory as outside walls when closed, and as roofs when open. Of course it is possible; all things are possible to those who have ingenuity and money. A floor for the outside part, that is, for what would be under this broad side when it was raised up, ought to be of something besides wood, for the sake of durability. Bricks, tiles, or some kind of concrete would answer as well as stone.

We live in the country, away from the region of paved walks. What kind of a walk can I make (not too expensive) all around the house, so we can get a little exercise in the open air without wet feet?

The cheapest, and, on the whole, the most satisfactory walk for the country during the seasons of dew, mud, rain, and snow, is a stout pair of overshoes. A walk of this kind can be taken up and laid down where it will do the most good, with the utmost speed and facility. It can be kept clean and dry with very little trouble, and is not expensive. Those who are accustomed to use it enjoy a freedom of movement and an immunity from the perils of locomotion that are unknown to pedestrians whose comfort depends on the condition of the sidewalks.

To speak seriously, it is amazing that country and village people pay so little regard to the walks in the streets and about their houses. We suppose our correspondent has in mind what might be called a terrace or promenade immediately around the house, a sort of "ghost's walk," from which the snow could easily be swept, and from which the water would run off quickly. A concrete or asphalt paving, like that used for sidewalks, would be the cleanest and most appropriate material for such a purpose, and probably the cheapest.—*The Builder.*

MASONS' AND BUILDERS' EXCHANGE
OF SAN FRANCISCO,
Room 11, 314 Montgomery St.

BELOW will be found a list of the members composing this Exchange. Boxes are provided for each member, so that architects, owners, or others desiring the services of any particular member, or those having boxes who are not members, and yet whose business is directly connected with that of the Exchange, can readily secure the attendance of the party sought, by leaving a note in the respective boxes.

O.—M. Bievis.
C.—J. H. thom Wohrden.
$1,800.

Nineteenth, nr. Stevenson. One-story frame.
O.—W. F. Fuller.
A.—W. H. Bayless.
C.—W. Langstaff.
$2,500.

Nineteenth, nr. Stevenson. One story frame.
O.—Mr. Gould.
A.—W. H. Bayless.
C.—W. Langstaff.
$2,500.

Twentieth, nr. Valencia. Two-story frame.
O.—J. A. Spanner.
Day's work.
$3,200.

Page, nr. Octavia. Two-story frame.
O.—J. McLoughlin.
A.—J. J. Clark.
C.—J. Carbery.
$4,000.

Fifth, cor. Shipley. Alterations.
O.—Hibernia Bank.
A.—Huenne & Everett.
C.—F. Buckley.
$2,700.

Market, opposite Seventh. Three-story brick.
O.—A. Kohler.
A.—J. Gosling.
C.—J. W. Duncan.
$14,000.

Howard, nr. Seventeenth. Alterations.
O.—H. Horstmann
A.—H. Gellluss.
C.—H. Meyn.
$1,000.

Pacific Avenue, near Steiner. One-story frame.
O.—L. Holtz.
A.—H. Gellhass.
C.—H. Meyn.
$2,500.

Howard, nr. Fourth. Two-story frame.
O.—E. M. & F. H. Jones.
Day's work.
$9,000.

Jackson, nr. Davis. Three-story brick.
O.—Mrs. Kirbey.
A.—J. Marquis.
C.—Hatfield & McRae.
$10,000.

California, nr. Buchanan. Two-story frame.
O.—Dr. Bowie.
A.—W. P. Moore.
C.—A. Jackson.

Castro, corner Fifteenth. Two-story frame.
O.—G. Krutmeyer.
A.—Townsend & Wyneken.
C.—T. Somerset.
$6,000.

Filbert, nr. Mason. Alterations.
O.—Mrs. M. Boland.
A.—Townsend & Wyneken.
C.—Brown & Bridget.
$700.

Filbert, nr. Mason. Two-story frame.

ENTERED AT POST-OFFICE AS SECOND CLASS MATTER.

ADVERTISING RATES.

Front Cover, outside, each insertion $2.50 per square.
Back Cover, outside, each insertion, $2.00 per square.
Page preceding reading matter, $1.75 per square.
Page following reading matter, $1.50 per square,
Inside Pages, each insertion, $1.00 per square.
Full Page, inside, one insertion, $40.00.
Each subsequent insertion according to agreement.

A square is seven-eighths of an inch in length by width of column.

Advertisements alone inserted that refer to materials used in the construction and furnishing of houses, and to matters and trades belonging to the building interest.

NO OTHERS RECEIVED.

Advertisements inserted for three months or less are payable in advance; payable quarterly when inserted for a longer period.

When money is sent for subscriptions, the receipt of a copy of this journal is an acknowledgment that it has been received. Unless requested we do not send receipts.

RETROSPECT FOR 1884.

The Most Successful Building Period on Record—An Average of 94 New Buildings Per Month.

TRULY the year now in its last days may be said to have been the mechanics' harvest. At no time during the twelve months was there a lack of work for *good* workmen in any branch of the mechanical trades. Masons have been especially busy, owing to the number of large buildings that have been erected, or are now in process of construction. But even the great number of skilled men on the new brick edifices now adorning our principal streets, is not equal to the small army required to substitute

BRICK FOR WOODEN FOUNDATIONS,

And for the necessary building of chimneys, bulkheads, nogging, etc., in the frame structures.

The substitution of brick for wooden foundations, in many of the buildings erected by the "*Real Estate Associates*," has now come to be a necessity. The old wooden mudsills are sadly rotting away, proving that redwood is not imperishable. This is particularly noticeable in the Mission, several of the buildings erected by the above-named Association having lately had brick substituted for wood. Several more will soon undergo the same process. Owners now are wisely concluding to stand the extra expense of brick when they first build, and not wait till wood is completely rotted out before they make the change.

CARPENTERS.

Although there has been an unusual demand for carpenters in the city, still there has been a bountiful supply of men, *such as they are*. The skilled mechanics have all been busy, and have put in nearly full time.

Owing to the lack of country work, we have been blessed (?) with an army of "piece-workers," who have generally, for the greater part of the year, sought odd jobs around the country. These men have found it hard to obtain employment, as a few days' trial generally lets them out; and even when a job is obtained, the rustic and flooring are soon placed in position, and then they must give way to *mechanics*.

WORK IN THE COUNTRY

Has been very light and scattering, owing to the generally low prices received by the farmers for their material. In 1882

NUMEROUS FIRES IN COUNTRY TOWNS

Gave the opportunity to hundreds of men to secure rebuilding contracts. The year just ending has been remarkably free from large conflagrations, and we do not call to mind a single town that has suffered enough, in this regard, to cause a hegira among the wood-workers.

WAGES FIRM.

All through the year wages remained firm, and steadier remunerative prices have been secured by mechanics than for any similar period, even the army of piece-workers not being able to reduce the wages of the regular hands.

LATHERS AND PLASTERERS.

Artisans in the above line have been very busy during the entire year—in fact, so much so that at times work has been delayed on account of a scarcity of help.

SUMMARY.

We present below a summary of building operations for the year. More than usual interest attaches to the same, as it is by considerable, the largest showing for any year of which we have a record.

	Frame Buildings.		Brick Buildings.		Repairs and Alterations.		Total No. of B'ld'gs for Mo.	Total Cost for Month.
	No.	Cost.	No.	Cost.	No.	Cost.		
January	30	$176,600	1	$ 5,400	14	$ 44,115	45	$226,115
February	36	112,650	3	179,700	5	37,200	44	329,550
March	98	291,150	3	128,500	8	39,000	109	458,650
April	100	535,655	3	297,000	18	69,900	121	902,555
May	79	449,660			19	105,800	98	555,460
June	92	433,700	1	60,000	19	68,200	112	561,900
July	69	340,200	4	253,545	14	40,164	87	633,909
August	75	321,500	4	336,500	11	34,800	90	692,800
September	83	366,456	2	210,000	19	50,100	104	626,556
October	69	340,890	2	42,000	25	77,360	96	460,250
November	81	365,197	2	24,000	20	29,100	103	418,297
December	93	379,543			25	58,222	118	437,765
Total	905	4,112,201	25	1,536,645	197	553,961	1,127	6,302,807

It will be noticed that building in the latter half of the year is much greater than similar periods in any previous record.

The statement for December is a remarkable one, as it shows there have been commenced of improvements,

118 BUILDINGS OF THE VALUE OF $437,765.

For the sake of comparison we give the figures for each year from 1880.

YEAR.	BUILDINGS.	VALUE.
1880	397	$1,754,435
1881	533	3,790,732
1882	785	3,896,212
1883	803	5,261,689
1884	1127	6,302,807

We have given no credit in the above for money expended on the Flood mansion. The material for that building is being obtained in the East, and, of course, its value being paid *there*, cannot find a place in our estimates. We enter our protest against the expenditure of money East for material, the equal, if not superior article, being obtainable on this coast; especially do we regret, when we consider that the money for which the building is being erected was made from the working people of this coast, and they should have, at least, the chance to recover, by steady work, the money thrown away by assessments paid, to find its way by roundabout methods into the millionaire's pocket. In more than one instance have our Nob Hillites sent thousands of dollars East for work and materials which could have been duplicated on this coast, both in design and workmanship, and just for the simple reason that it would seem higher-toned to say this or that came from Berlin, Paris, or Kamschatka.

NOT A BUILDING BOOM,

In the general acceptation of that phrase, should the transactions of this year be classed. A reasonably busy activity has continued throughout the entire year, and in not a single instance have

ARCHITECTS BEEN CROWDED

With orders for work. True, most of those engaged in that profession have had a reasonable amount of work, but it has been obtained so gradually and steadily that at no time, without a single exception, have architects delayed their clients on account of rush of orders.

DRAUGHTSMEN.

There have lately come to this city quite a number of young men who are desirous of obtaining employment as draughtsmen. Their qualifications consist of about the following: Ability to trace drawings if not too difficult; can give directions to the head of the office how things ought to be done; able to copy specifications if the hard words are explained to them, and sundry other difficult acquirements. To all such we would say, California is not the place for your genius to show its brightness; keep away, for our people are not able to appreciate your talents.

FAITHFUL, CAPABLE MEN

Are the only kind wanted here, and if a few were to arrive of the calibre to meet the requirements of our architects, no doubt they would obtain steady employment.

THANKS.

We sincerely tender our thanks to all those who have so kindly assisted us in the past year, furnishing us information in regard to matters of interest to our readers.

A Success with Which We Are Pleased.

With this, the closing number of the sixth volume of this Journal, it is fitting and proper that we should again express our sincere acknowledgments of the manifold favors and encouragements received, and return heartfelt thanks to our friends and patrons for the liberal support extended in both subscription and advertising patronage, and to our numerous contemporaries who have manifested toward this Journal such marked appreciation of our efforts to make it worthy the high esteem in which it is held among the hundreds of publications of like class, import, and character.

It cannot be otherwise than acknowledged that its columns have not been made to subserve, in the slightest degree, the personal, professional interests of its proprietors. They have in no instance availed themselves of the privileges entirely under their control, of using its columns for their special benefit, but have freely, and with honest intent and pleasure, and without reserve, published from time to time, facts and statements of interest to others which, if made in reference to themselves, might have justified the charge of seeking to further ends and purposes not entirely in harmony with honorable and unselfish journalism. And as in the past, so in the future, its columns will be free from all selfish interests, beyond the legitimate profits of its publication, and the proud satisfaction of having it recognized as among the very best journals of its kind published in the United States. That it has reached this pleasing attitude in journalism, is fully demonstrated by the fact that our exchange list now numbers over one hundred and fifty, among which are all the well known and most influential publications of the country, and others from London and other parts of the world.

In looking back to the time when alone, and under tremendous disadvantages and discouragements, the senior editor embarked in the undertaking, its existence seems almost chimerical. It is questionable whether, under like circumstances, he or any other living man would undertake to repeat the venture. Without one single encouraging condition, with all—all mechanical, financial, commercial, and other interests prostrated, the terrible gloom that spread over the entire State through the heartless and reckless political agitations of the period prevailing in its severest form, a majority of the working classes scarcely able to procure the humblest necessaries of life, all combined to render the attempt almost a fete of daring, and nothing short of indomitable perseverance and obstinate fighting against untoward circumstances, gave it birth and vitality. But the worst has long since been past, and we have our sweet satisfaction in the grand result which we enjoy at this hour in seeing it advance to its present prosperous condition, and recognized in so many ways and from so many sources as an indispensable publication upon the Pacific Coast. In all this, since the earlier days of its existence, the junior editor has performed his part, and in all possible ways, to the very best of his ability and judgment, has allowed no opportunities of improvement to pass which could be secured by earnest effort and attention.

Tracing up from the commencement to the present time, a very marked difference is noticeable in the issues of 1879 and 1880, and those of the volume ending with the present number. We hope that the numbers of the seventh and all succeeding volumes will exhibit as marked a difference in the upward direction; at any rate, unceasing efforts will be made with strong hopes of success, and if our friends generally, and our brethren of the architectural profession could only be induced to *put into practice* some of the *hundreds of promises made to us*, to furnish pertinent and interesting articles upon some of the thousands of topics at their command, in architectural, constructive, sanatory, mechanical, inventive, and kindred sciences, they would thereby greatly benefit themselves and others, as well as assist in furnishing our readers with the rich fruits of many minds,—subjects analyzed and dressed up in form, theory and fact, according to views entertained, some of which may prove to be of inestimable value in ways at present not fully comprehended. Those who "cast bread upon the waters" are often made glad by its appearance "after many days."

San Francisco Chapter, American Institute of Architects.

The regular monthly meeting of the Chapter was held Friday evening, Dec. 5th. President A. Laver in the chair.

The committee on incorporating the Chapter reported progress. The articles have been filed, and but a few minor details are to be taken to have the Chapter in working order as an incorporated body.

Emil John was proposed for membership as an Associate. Referred to Messrs. Sanders, Pissis, and Moore.

The President, assisted by Mr. Gash, then presented prizes to the pupils to whom they were awarded, as follows:—

Max. G. Bugbee received a fine box of drawing instruments as first prize in free hand drawing.

Louis Stone received Ferguson's History of Architecture as first prize in architecture.

Robt. G. Frise received a similar prize to last mentioned as first prize in mathematics.

Wm. Lee and E. A. Williams each received a copy of Rosengarten's Hand Book of Architectural Styles, as special prizes for general proficiency and progress in the several branches.

A letter was received by Mr. Laver from the Royal Institute of British Architects, requesting the Chapter to indorse their movement in regard to holding an exhibition of American Arts and Sciences, to be held in London in 1886. The following committee were appointed to take action upon the same: Messrs. Laver, Gash, and Wright.

The teachers of the various classes were tendered a vote of thanks for their faithful services during the past year to the pupils under their charge.

OUR ILLUSTRATIONS.

A Comfortable $5,000 Country Home—The New Panorama Building—Rustic Cottages.

On pages 213, 214, 215 we present the elevation and plans of a comfortable country residence, costing about $5,000.

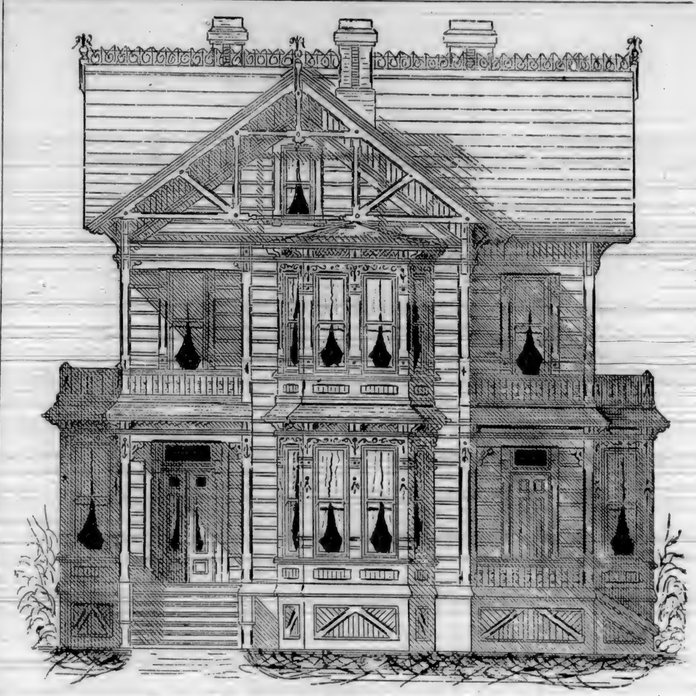
It will be noticed that every room on the first floor is accessible from the hall. This is an especial feature in country houses. The front hall can easily be converted into a waiting room by having curtains hung in the archway at the foot of the stairs. As a very general rule, Californians do not prefer the hall to be made into a reception room.

The sitting and dining-rooms are convenient and with the aid of the sliding doors can be practically made into one large room. The former is connected with the back porch by the door shown, and is thus easily accessible to members of the family without going through the main hall. Abundance of closet room is provided.

The second story plan will recommend itself for the comforts shown. Attention is called to the excellent arrangement of the water-closet, being easily accessible both from bath-room and hall.

The design shown on page 217, is that of the new Panorama Building, lately erected in this city, A. Pissis being the architect.

The other designs shown are for rustic cottages for a suburban town.



FRONT ELEVATION OF $5,000 COUNTRY DWELLING.

Our Exchanges.

We have made arrangements with the Editors of the following Journals, by which we are enabled to offer quite a reduction to those subscribing for any one of them in connection with this Journal.

(The figures in parenthesis denote the price of the journals alone.)

CALIFORNIA ARCHITECT AND BUILDING NEWS
Terms, $2.00 per annum.

With *American Architect* ($6.00), $7.00 per annum.
With *Builder and Wood Worker* ($1.00), $2.50 per annum.
With *Inland Architect and Builder* ($1.75), $3.25 per annum.
With *American Artisan* ($1.00), $2.50 per annum.
With *Building* ($1.00), $2.50 per annum.
With *North Western Lumberman* ($4.00), $5.00 per annum.
With *Scientific American* ($3.20), $4.50 per annum.
With *Leffels' Mechanical News* ($1.00), $2.50 per annum.
With *Decorator and Furnisher* ($4.00), $5.00 per annum.
With *American Machinist* ($2.50), $4.00 per annum.
With *The Wood Worker* ($1.00), $2.50 per annum.
With *The Builder* ($2.00), $3.50 per annum.
With *Hall's Journal of Health* ($1.00), $2.50 per annum.
With *Cincinnati Building Review* ($1.00), $2.50 per annum.

We will add to the above list from time to time, as our arrangements are perfected with the publishers. We are prepared to furnish any journal printed at the shortest possible notice.

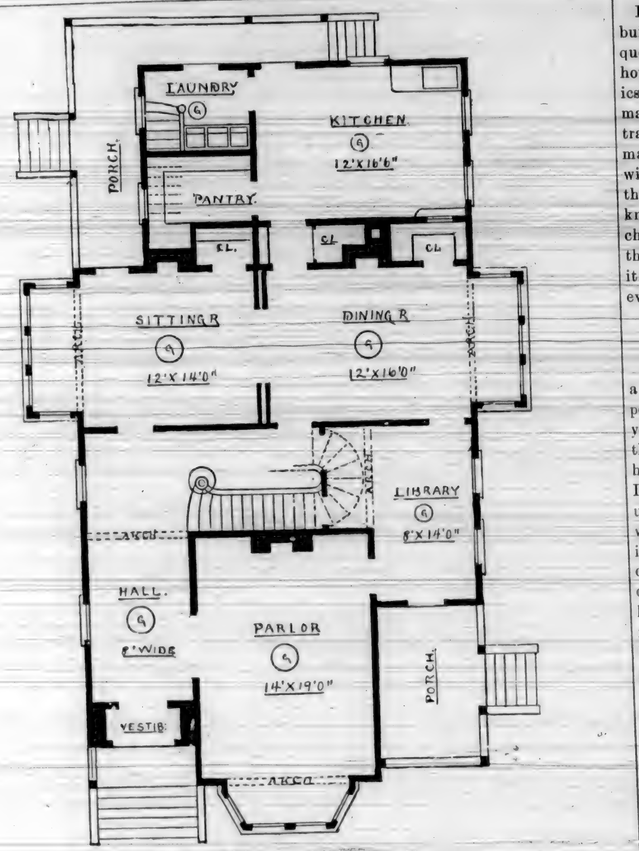
Chapter Incorporation.

Since our last issue, San Francisco Chapter of the American Institute of Architects has been duly incorporated under the statute of California, in such cases made and provided, with James E. Wolfe, Wm. Curlett, W. J. Mathews, G. H. Sanders, and T. J. Welsh as the incorporating trustees. The incorporation is to exist for fifty years, a period which suggests the thought, Will any of the present, practicing members of the Chapter, or any of the practicing members of the profession, now in San Francisco, not in membership, be upon this mortal stage of action at the expiration of the Chapter period? Some of the younger students and apprentice members, in all reasonable probability, will be, and it will certainly be a source of pleasure to those advanced to the silvery age of whitened locks—some of whom, in all human probability, will be called to pass from earthly scenes and pursuits, to the realities, whatever they may be, beyond the reach of human conception, ere even one of the five decades of incorporation shall have expired—to see the young men in the profession fostering, by their earnest interest and devotion, the institution now fixed, by the present active membership, upon a foundation which provides for its continued prosperity, with reasonable assurance that at the end of fifty years it will have grown in interest, and developed into an organization of great usefulness and influence, doing honor to the memory of those who founded it, and those who may hereafter sustain and enlarge its sphere of usefulness. Its growth, prosperity, and permanency is a matter which demands and justifies the personal interest of every well-wisher of the profession, and we hope the day will soon come when the name of not a single worthy and honorable member of the profession shall be missed from its roll.

Hammer or Nail—Query.

"Which gets the harder lick—a hammer or nail—when the nail is struck with a hammer?" Both alike, except, unfortunately, your finger should happen to share with the nail in its part of the "lick."

Steel Square and its Uses. Price, $1.00.



FIRST STORY PLAN OF $5,00 COUNTRY DWELLING.

The Mechanic's Christmas.

SURELY the Christmas now near at hand should be hailed with pleasure by all of our mechanics. The year now almost ended has been one of unusual activity, and those who have been frugal in their habits should have enough on hand to make glad the hearts of the little ones.

Wages have been kept up to the full standard for all desirable help throughout the year, and the immediate future is full of promise. Even with the work now in progress a goodly portion of our laboring population can command steady remunerative wages for a larger part of the time.

We wish one and all of those whose labor has done so much to beautify the city, a hearty and merry Christmas, and many a happy New Year.

A Bar of Square Wrought Iron, Supported at each end, and a load placed in the center, will bear much more weight when placed flat than hen placed on one corner. The difference is about as six to five.

Mechanics' Liens.

A BILL for a new mechanics' lien law was drawn up lately by representatives of the various trade unions assembled at the State Bureau of Labor Statistics. It modifies the existing law in this, that it gives laborers a prior claim over material men, where both have filed liens. As the matter now stands, liens on buildings are ranked as follows: First, all persons other than the original contractors and sub-contractors; second, the sub-contractors, and third, the original contractors. The first class consists of mechanics, material men, artisans, architects, and laborers of every class. It is now proposed to eliminate from this class the material men and subordinate their claim to that of the mechanic, artisan, and laborer. The proposition commends itself to justice and appears to be in conformity with sound principles of equity, for it is obvious that the furnisher of bricks and lumber and iron and glass and mortar can better stand a loss than the laborer, whose food depends on his daily earnings.

In actual practice, as all persons who have built houses will testify, the lien law more frequently causes hardship to the man who has a house built than to the builders and mechanics. It is quite a common occurrence for a man who has had a house built by a contractor to find his house liened by some workman whom the contractor has failed to settle with, and this after the owner has fully paid the contractor. In Chicago and Kansas City knavish contractors have made a practice of cheating their men, collecting full pay from the house-owner, and then leaving him to fight it out with the mechanics. No remedy for the evil was ever discovered.—*Chronicle.*

Decrease of Lumber Imports.

DURING the past sixty days there has been a less quantity of lumber shipped to this port than for any similar period in over two years. This is accounted for by the desire of the lumber merchants here to reduce stock on hand. As will be seen by our Building Intelligence, there are more buildings now under way than for any December month of which we have a record. The local demand is unusually large, and if the opening months of 1885 show the same activity in building circles as at present, by March the stock on hand will be so greatly reduced that the millmen will endeavor to convince the public that lumber is scarce, and thus pave the way to a general rise.

We are pleased to learn that several South American orders of large amounts have been received for lumber. The mills furnishing these orders will have the lumber shipped directly therefrom, so the "big yard across the bridge" will not be made any smaller by the orders received.

Some time ago it was proposed to frame a law by which it would be unlawful for a railroad company to increase their rates after having once made a reduction. The same principle ought to be applied to lumber, so that our capitalists and builders could calculate ahead of time, the price for which they could erect buildings, or make other improvements.

Modern Architectural Designs and Details. Price, $10.00.

SPECIAL OFFER.

BOUND VOLUMES OF THIS JOURNAL

TO NEW SUBSCRIBERS FOR 1885.

Upon receipt of $3.25 we will send a bound volume of this Journal of either 1880, 1881, or 1882 and the full year's numbers of 1885.

We have had an extra number bound of the years mentioned, and make this offer to increase our subscription list. We are bound to increase our list, so that the end of the year 1885 will witness not less than

TEN THOUSAND

Paying subscribers on our books.

Work and Wages.

THE naming of a day early in the spring of 1886 for a convention of representatives of all the labor organizations in the country, whereat steps shall be taken to make the legal working-day in every part of the country no more and no less than eight hours, makes it very desirable to expose the fallacy of the "eight-hour movement." As we have never seen it put in a more simple and understandable form than has lately been employed by the Boston *Herald*, we reproduce its arguments at length:—

WILTON, Me., September 29, 1884.

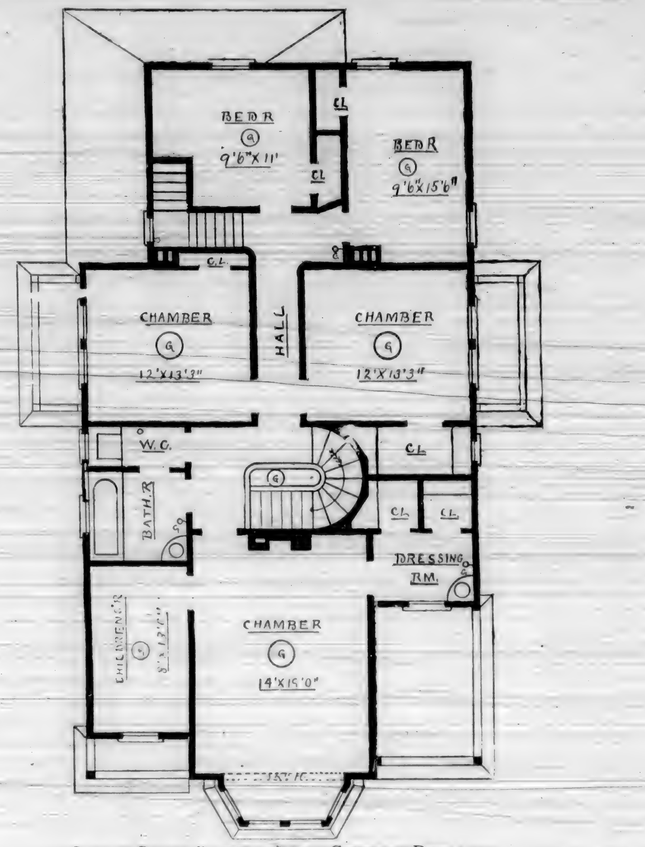
TO THE EDITOR OF THE HERALD.—In conversation recently with a gentleman from New York, a contractor and builder, and an ardent disciple of B. F. Butler, he advocated the passage of a law making eight hours constitute a day's work. He urged that its adoption would be immediately followed by a rise in wages, because it would create a demand for twenty per cent. more labor.

Now, I am confident this reasoning is incorrect, but I am unable to demonstrate its fallacy to my entire satisfaction, so I appeal to you to set me right.

If it will not trespass too largely upon your time and space, an answer through the columns of the *Herald* will greatly oblige, F. A. R.

The fallacy conveyed in the above assumption is a common one, and runs through all legislation in this country on industrial subjects. Thus, if the assumption were correct that a rigidly applied eight-hour law would be immediately followed by a rise in wages, on account of the demand for twenty per cent. more labor, then if work were restricted to two hours per day, there would be a still greater increase in wages on account of the demand for eighty per cent. more labor, that is to say, the less time a laborer worked, the more money he would receive, and hence, with two hours' toil out of the twenty-four, he would make very much more money than he now does by the steady strain of ten hours per day.

This is a delightful theory, and for the good of humanity it is a great pity that in its practical execution certain obstacles are met with which seriously militate against its efficacy. If it were possible of application, the entire problem of procuring for human beings in this world a happy and contented existence would be at once solved. With plenty of time for study and recreation, even the commonest workingman could be both a student and gentleman of leisure, while the scale of pay would be so high as to place every one far beyond the possibility of want. But, as we have said above, there are one or two slight obstacles in the way. If under an eight-hour law but four-fifths, or under a two-hour law but one-fifth, of the wealth is produced that is now the result of ten hours' labor, then necessarily there would be only four-fifths, or one-fifth, of the amount to divide among the workers and the capitalists. As a man cannot by taking thought add one cubit to his stature, so the people of a country cannot by legislation produce any more wealth than their daily work enables them to produce. Wages are paid from the wealth which labor produces, and if this production is restricted, then there must of necessity be a corresponding shrinkage in the rate of wages paid. If men could turn out as much in eight hours as they can in ten, then the rate of wages might be the same in either case; but not unless the results of work corresponded. To give a broad example: According to the census of 1880, there was produced that year in the United States wealth approximately amounting to $7,500,000,000. Of this, fully $6,500,000,000 worth of wealth, or $130 per individual, was used up during the year in supporting the life of the community, leaving a margin of saved or reserved wealth of not quite $1,000,000,000. Now, if the work of the entire community had been cut down twenty per cent. in amount, we should have produced in the year $1,500,000,000 less of wealth. If we had continued our consumption at the same rate, not only should we have laid nothing aside, but we should have begun the year 1881, $500,000,000 worse off in wealth than we were when we began the previous year. On the other hand, if the united work of the community had produced wealth to the amount of $15,000,000,000, then there would have been very much more to divide among all classes of the community. The consumption of wealth would have been much greater, and yet the surplus revenue left over could have been considerably larger than it was. In short, where there is a large production, there is of necessity large wages, where, where there is small production, the wages are correspondingly low. So long as time remains an element in production, the longer that a man works, everything else being equal, the greater will be the amount of wealth he will produce, and the larger the amount of wages that can be paid him. In order that there be no mistake, we would add that it frequently happens that a man can produce more wealth by the work of ten hours than by the work of twelve, fourteen, or sixteen hours per day, for the reason that the strain upon his physical and mental powers by continued application makes it impossible for him to perform careful and effective service during these long periods of time.



SECOND STORY PLAN OF $5,000 COUNTRY DWELLING.

House Plans—a new work. Price, $2.50.

Panorama Building.

THERE has lately been erected in this city, a building that is different in construction from any that has as yet been built. Our engraving presents a very correct view of the Panorama Building.

It occupies the 50 Vara lot on the southwest corner of Mason and Eddy Streets. The building is in shape a polygon of sixteen sides, and is 126 feet in diameter. The outside walls are fifty feet in height, the apex of the roof being seventy-six feet. The building is strongly put together, and is admirably adapted for its intended purposes.

The entrance is broad, with rooms each side for ladies' parlors, etc. After passing the portals, two corridors are seen. One of these is intended for an entrance-way and the other for exit. These corridors are darkened so that a person entering from the street will gradually lose the effect of the outside light and be prepared for the different rays from the interior.

At the end of the corridors are winding stairs, four feet six inches wide. These lead to a platform in center of building. This platform is thirty-five feet in diameter and is capable of holding about 400 people.

From the platform, a grand view of the panorama may be seen. The picture extends clear around the whole building and is in size 48 by 380 feet. The first painting to be placed on exhibition will be the "Battle of Waterloo," the work of Joseph Bertram and L. Sargent.

The arrangement of the shades to regulate the lighting of the interior, is a novel one and much credit is due to its originator. The architect of the structure is Mr. A. Pissis.

To Our "Mechanic" Patrons.

WE have been favored in the past with numerous most excellent and well-written articles from the pens of patrons who toil for their daily bread—mechanics whose thoughts are largely the result of practical, daily experience—the hours of study with such being but few, and those more generally after the physical, forces have been subjected to the strain of a more or less "hard day's work." So excellent have some of these articles been that they have been copied into numerous other journals and thereby given publicity throughout the length and breadth of our country; and beyond this, European journals have also copied, so that those, in many cases, who have given an hour or two to placing their thoughts and conceptions in shape for the columns of this Journal, have furnished matter read by hundreds of thousands of their fellow-men; and although they may never meet with merited, personal responses and acknowledgments, they nevertheless have done good work, which, if not otherwise compensated, may meet its reward in that grand hour when "every man shall receive according to the works done in the body." Prominent among these is "J. E. W. C.," whose articles have been well received, and largely copied. Mechanics of California are not hundreds of you allowing the golden opportunities at your disposal to pass unimproved, in not availing yourselves of the facilities presented through this journal to develop the mental, intellectual, and practical powers of mind and thought, which in so many are allowed to remain dormant through passive indifference and neglect, thus depriving yourselves of the benefits which never fail to follow in those who seek to improve themselves and their fellow-men by revealing and making known every best thought which earnest reflection, meditation, and free expression brings.

We have again and again proffered space in the columns of this Journal to all of every class, mechanics as well as architects, engineers, inventors, assigners, scientists, producers of material and devices, and all others, and our proffer has been accepted by many, but we again ask that many more may join the number, so that our seventh volume may be honored with numerous well-written articles, pertinent and expressive of new ideas, or of old in new dress. The *abilities* are not lacking; it is the absence of *will and purpose*, and in some, a selfishness which belittles and dishonors; a fear to "give away" that which, concealed, is of but little value, but which sown broadcast may carry joy to thousands. Individual human thought and knowledge are limited to the years of human life, if held in bondage until the hour of death, with which all thinking ends, and that which has been in our power to make useful to others, passes away with us, unless we fructify and enrich the soil of our existence, by scattering broadcast the seed of thought which God and nature has caused to form in us—for what purpose? to rot and perish in ourselves? No, but that we may plant them in other minds to grow and bring forth other seed, and harvests of rich, ripe fruit. Brethren, reflect and act accordingly. The columns of this journal are open for you, and we invite you to come with the best you can give, and if any have good thoughts and ideas, and feel to lack the word clothing necessary to make them presentable, come, and we will help you dress them up in the best style possible, according to our abilities so to do.

Brass in House Furnishing.

WHILST brass has at all times been employed for artistic purposes, it has been subject in this respect to the laws of fashion, being resorted to at one period more than another. From the mediæval age it has been continually patronized, however, for ecclesiastical furniture and its accessories, as in altar frontals, pedestals of fonts, and symbolic devices. The present tendency of decorative art toward rich and attractive colors, in material and in surface tints, and the freedom imparted to design, owing to the breaking up of former set styles, with the prevailing taste for the most cheerful possible aspect to interiors, and an improving standard of elegance and refinement, have led to a greater prominence than formerly was given in the use of brass furniture.

In cabinet work, builders' hardware and the ornaments that pertain to a well-furnished room, this metal has a well-defined sphere of employment. Considerable originality, with much good taste, is shown in the designs of the brass furniture brought out. Resort to fire-gilt gilding prevents all liability to tarnish, and this gilding, through the variation in hues that can be imparted to the surface, multiplies artistic effects, whether used separately or in combination. The surface of brass takes satin finish, dead lustre, brown bronze, and oxydized silver. Tiles and enamels in delicately tinted designs associate admirably with brass in furniture and general decorative work, so also dark woods. A quality decidedly favoring brass is that its beauty is enhanced by artificial light.

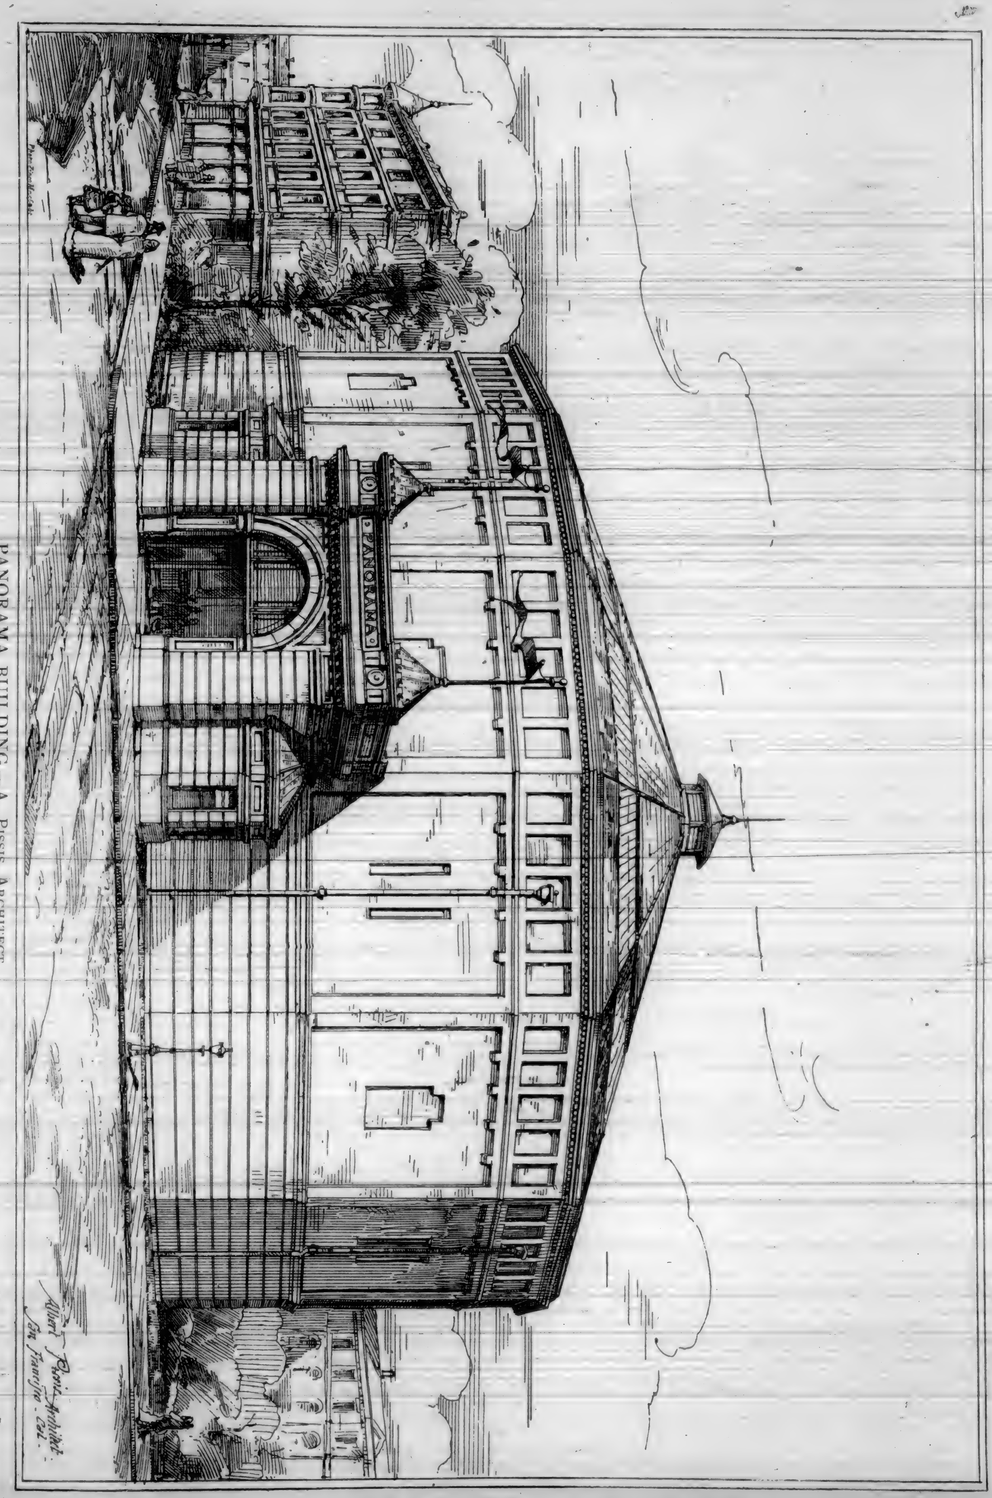
There is no question that in dealing with this metal, American art exhibits higher taste in furniture than in the greater proportion of that turned out in England. As a rule it is simple, and, if apparently less ornate, is more satisfactory. The elaborate ornament at low cost in the abounding English work is due to the employment of sheet metal stamped in imitation of wrought work, the moulds ensuring often an undesirable amount of uniformity.

The pieces of stamped in sheet metal, entirely composing an article, are riveted together. Stamped is used for picture frames, but is always wanting in the ancient wrought work for this purpose. It suits well such articles as coal and fire-wood boxes, of which some fine old examples are to be met, also for fire and stove screens. Owing to the thinness of stamped metal it is unsuitable for fenders; in fenders preference should be given to perforated designs of naturalistic formes conventionalized, or to mounted bars with standards.

Some admirable brass fire-gilt mantels, broad and lofty, and constituting imposing mural decorations, are finding their place in the city mansions. Other metal than brass, particularly hammered copper and oxydized silver, are frequently introduced in these for contrast and giving depth to the designs with other scenic effects, whilst painted tiles in brass panels, in diapered and other forms, line the several recesses.

Steel is well combined with brass both in fenders and fire and dog irons. One use to which raised brass work is well applied is for lining the backs of open fire-places, the design being commonly small diapered forms with central figures, or tiles sunk in panels. The rough filing of the surface off so as to give it a surface of rough and irregular sparkling grains for a coating, set off with burnished edges or terminals, was a favorite mode of decoration under the first French empire, particularly for chandeliers of the corona style, in the way of massive pendants.—*Decorator and Furnisher.*

Universal Assistant and Complete Mechanic. Price, $3.00.



PANORAMA BUILDING.—A. PISSIS, ARCHITECT.

DESIGN FOR A RUSTIC COUNTRY DWELLING.

Wages and Material.

FOR the convenience of many of our readers, we give the price of some of the building materials used, and labor in connection therewith:—

Rough Lumber	$18 00 per M.
Surfaced Lumber	33 00 " "
Lath	3 50 " "
Shingles	2 50 " "
Nails	2 75 " keg.
Hardware	Cheap.
Lime	1 50 per bbl.
Cement	$2 25 to 4 50 " "
Plastering	28 " yd.
LABOR.	
Carpenters	$3 50 per day.
Masons	5 00 " "
Cabinet Makers	3 50 " "
Hod Carriers	3 00 " "
Laborers	2 00 " "
Plumbers (and help)	6 00 " "

Glass, mantles, roofing, etc., can be had at low rates.

We print the above in answer to several questions received.

Architect's services are placed by the laws of the Chapter at $15.00 per day.

Draughtsmen command from $1.00 to $5.00 per day according to ability.

CAN you explain how it is that although water expands in freezing, a piece of wet board when frozen is smaller than at any other time? That it is so I have proved repeatedly, although I have heard the fact disputed. *A.*—The expansion of water ceases at the moment of congelation. Ice contracts by cold more than wood.

The Wall as an Architectural Feature.

PROFESSOR ROGER SMITH gave an interesting introductory lecture on this subject to the architectural students at University College, on Friday, the 3d inst., of which the following remarks formed a portion:—

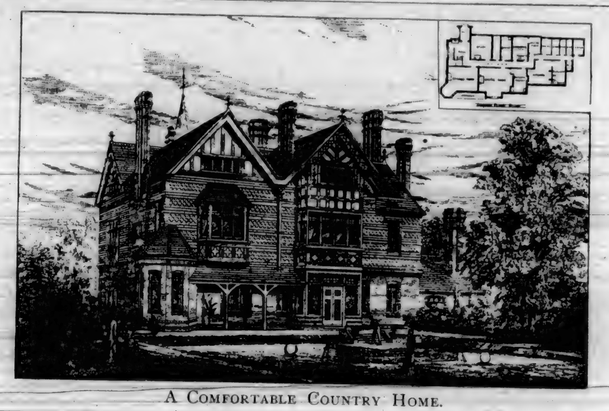
The preparation for building a wall is, as every one knows, to find or make a foundation. A bad foundation is literally, as well as in a figure of speech, at the bottom of most of the failures that occur in walls. When a good foundation is secured, the success of the wall is rendered possible. What is a good foundation? The best is one that is perfectly immovable and incompressible, such as rock. The house built upon a rock is the one safe to stand. Next to this, and only one degree less good, is the foundation which may yield or compress slightly under a load, but will do so with perfect uniformity. Soft, irregular, shifting foundations and those exposed to the action of water, frost, and air, are among the most notoriously bad ones. The ordinary London foundation is clay, in some cases mixed with loam or sand. In building on it great care is necessary; the foundation must be carried so far below the surface that frost will not penetrate to it. To secure this in the London climate you should go 4 feet deep, and even more.

The surface round the building should also be protected so as to prevent the percolation of water. The weights of the different parts of the wall should be as nearly uniform as possible, and they should not be extreme. Four tons per foot superficial is quite enough. It has become a practice of late years to form a kind of artificial rock of concrete upon the foundations of earth or clay, composed of small stones and lime or cement. This concrete, which hardens into an incompressible slab, admirably spreads and distributes the weight, and is of great use in preventing disaster. In the case of very bad foundations enormous quantities of concrete are often employed, and with success. The base of the wall, like the concrete, is below the level of the ground. It is, to some extent, a modern improvement, or, at least, it hangs on to the modern notion of building thin walls. In the Middle Ages, when walls were immensely thick, it was not very often customary to build them with spreading footings; now it is usual, and a most useful custom it is. Walls in London are required by law to be twice as wide at the bottom of the footings as they are themselves. Of all the properties a wall can possess I think stability is the most noteworthy. Of old this was sought in great thickness. The Romans first showed that constructive skill would enable men to build walls thinner than had been customary, and yet stable. Our modern walls are vastly thinner than those of the Romans; but then there are few modern buildings for which we expect, or could desire, a durability like that of ancient Roman work. Good materials, good putting together, and strong cement, with some amount of protection from weather, are what we must rely upon for the preservation of our walls. Homogeneousness, or the use of materials all of one sort, would seem at first sight to be essential to the construction of a good wall; and yet, though many ancient walls like those of Munich, and, I believe, those of Athens, were practically homogeneous, the walls cleverly put together by the Romans of three or four different sorts of materials have proved, some of them, to be all but indestructible.

Uprightness is essential to stability, and to look safe a wall must be obviously upright, though a tapering form, like the pylon of an Egyptian temple, also looks strong, and really is so. Length was the ancient way of giving importance and dignity to walls; height is the comparatively modern way. In the early ages of the world, and in the ruder stages of the development of modern nations, it is extent that is relied upon where an effect is to be produced. The greatest of the temples of Egypt, for example, the temple of Ramse, with its dependencies, extended over about 2,000 feet, or more than the third of a mile. The rude stone avenues of prehistoric origin to be met with at the spot of the same name in Brittany, extend over about a mile and a third of country; and, as another example of a different kind, I may recall to you the Roman wall which stretched right across the north of England. As the power of building, and skill in the production of architectural effect increased in any nation, height was more sought after than extent; but it was, with a few exceptions, reserved for Christian and modern architecture to attempt with success buildings in which height is the main feature.

Straight lines and right angles seem to have been almost the only rule in very ancient work, such as the Egyptian and the Assyrian. The Greeks first introduced curved walls in their theaters. The Romans continued and extended their use, and introduced polygonal shapes, all of which have obtained ever since. Colored materials are to be met with at all periods of the world's history; but as their use always has reference to the architectural effect of the wall, we will postpone them to the second part of the lecture. Having now looked a little at our wall, let us try to look into it as far as we can, and perhaps an architect can look further into a stone wall than some other people, notwithstanding the old proverb. What, then, are walls made of? You may lay it down as a general rule that a wall must be made of something that lies ready to hand. In many cases the fact that the material of which some small or ornate object is to be made comes from far is a point in its favor. We prefer Italian marbles to Devonshire, or to the serpentine of Cornwall, not because they are always more beautiful (for they are not), but because they are Italian. But for wall building so much and such heavy stuff is wanted that it never does to bring it far. Accordingly, in localities where nothing else is to be had, walls are built of earth. In Devonshire, for example, cottages, barns, and the walls of gardens and orchards are commonly of earth, and they are warm, solid, and, if well taken care of, durable; but moisture must not be allowed to get into the heart of them, or they will soon crumble. Next to earth is a material not, so far as I am aware, known in England, but once in use in the East, sun-dried bricks. Vitruvius says that the walls of Babylon were built with sun-dried bricks laid in bitumen; and it is supposed that they were largely used in Assyria and Babylonia, and that some of the shapeless mounds which now mark the site of ancient structures consist of a mass of what was once sun-dried bricks.

Next, of course, we should come to brick, the material only too familiar to the London eye, and the refuge of builders throughout the world and of every age who, like the London builder, were not so fortunate as to have stone within reach. In Egypt and many parts of Italy there are remains of brickwork of great antiquity, and in Lombardy, North Germany, France, Belgium, and our own country, brick has been extensively used, and is in use at the present day. Bricks were not always of the sizes and shapes we are familiar with. The Romans made them flat, more like our tiles, and in many European countries they have been used considerably smaller. The size is a good deal influenced by the weight. An English brick can be held and managed by an artisan with one hand. If it were much larger or much heavier it would take two hands, or even two men, as were probably employed on the Roman bricks. The most refined kind of brick is called terra cotta. It is



A COMFORTABLE COUNTRY HOME.

of the nature of brick, but bears the same kind of relation to it that marble does to stone or silver to pewter.

Terra cotta is, in theory at any rate, the most appropriate ornamental substance to employ with brickwork, and though there are some practical difficulties in the way of using it, when these are overcome it is an admirable material. The best and most desirable material for wall building is, however, s one. Every sort of stone that is in the least degree deserving the name of stone has b en made use of for the purpose of wall building,—from flints, which are some of them as inconvenient in shape for the mason's use as potatoes would be, up to the hardest granite, the finest and truest freestone from our many excellent limestone and sandstone quarries, or the beautiful and precious marbles of Greece and Italy. There are stone walls in Greece and in the Etruscan plain, which have come down to us from remote antiquity, made of large polygonal stones unwrought or but slightly wrought—and coarsely fitted together without mortar. There are others in Egypt of the finest polished granite with joints so close and true that the edge of a sheet of paper cannot be got between the blocks; but as remarkable in its way as these specimens of consummate handicraft is the construction of the Roman walls which were often made of small stones, such as we make macadamized roads of, set in a tenacious mortar which has hardened till it is as strong as the stone itself, and steadied at intervals by the introduction of a bond-course of flat bricks or large stones. With this mode of construction, which could be carried out anywhere, the Romans built vast works, the ruins of which remain all over Europe.

There is quite as much to learn about stone as about brick; in fact, a great deal more, as for example, how to select stone, for, owing to the ease with which many sorts of stone are acted upon by the weather, there are many precautions to be taken in the selection or use of material. I will just name the three cardinal ones, which are these: First, select for use stone from a quarry, and from a bed in that quarry which experience has shown to be durable. Secondly, let that stone lie in the building in the same way as it lay in the quarry, or, as masons would say, bedwise. Thirdly and lastly, take such precautions as will insure that no moisture gets into the inside of your wall, or into the heart of the stones that compose it. The materials I have named all of them require to be held together by some sort of cement if the wall is to be durable and weather-tight. Lime is at the bottom of all the cements in general use, and its faculty of hardening after being calcined and slaked, and, as it hardens, of adhering to the surface of the stones or bricks with which it is in contact, is invaluable. Mortar is made of quicklime and sand. Cements and hydraulic limes are compounds (natural or artificial) of lime and other substances, chiefly alumina, which enables it to set harder, and under water, and more rapidly than in its unmixed state. I need hardly point out that where the heart of a wall is of many rough stones laid with much mortar (a substance more or less impressible), while the face is formed of few well-dressed and square stones laid with little mortar, there must be great risk of the two parts of the wall behaving differently the one from the other when weight comes upon it.

This happened in much of the work of the builders during the eleventh and twelfth centuries in England,—the period of the Norman style. Professor Willis has gone so far as to say that if a Norman tower has not fallen, that circumstance throws great doubts upon its being Norman. Certainly an immense number of them have fallen, and as an example of failure, happily anticipated before there was a fall, I may remind you of Peterborough, where the core of the Normon piers carrying the great central tower has crumbled, and the piers have arched, and have been taken down within the past year. Different from the practice of building composite walls is another which I will only just mention, that of building hollow walls as a protection against damp. We have by no means exhausted the list of materials for walls if only

your patience will hold out. A modern material which I will just name, but not dwell on, is concrete, excellent if well looked after, dangerous otherwise; cheap if used in large quantities, and where there are few features or irregularities, but far from cheap in small or intricate buildings; very strong, very durable, and sometimes valuable where nature yields few materials for walls of another sort. Timber has been used time out of mind for the walls of houses, and even churches and dignified buildings, in the spots where it is plentiful. There is evidence that timber buildings were in use in Assyria, Egypt, and Lycia, from the curious fact that ancient remains of stone or marble are actually cut into shapes that imitate timber; indeed, the whole system of architectural treatment in use in Greece is a kind of petrification of timber construction. The countries of Europe where timber buildings are now mostly to be met with are Sweden, Norway, Russia, and Switzerland. They are in many ways excellent.

A timber wall is by no means a bad protection against weather; but it is liable to catch fire, and so is quite unfit for use in cities. Many railway stations in England, however, are built of timber, and any one of these will serve to illustrate a cheap way of building timber walls. In Sweden, whole logs, halved at the angles, are used, and a wall far more solid, durable, and weather-tight can be obtained. The same method is followed in Russia, and you may see a good specimen at the Health Exhibition in the Russian house at the back of the dairies. Timber framing filled in with plastering or with brick-work in the spaces, called usually half-timbered work, is an excellent material for walls if done with the solidity and liberal use of strong timbers that was common in England in the sixteenth and seventeenth centuries. In Lancashire and Cheshire, in Worcestershire and Gloucester, in Kent and Surrey, and in other parts of England you may find many fair half-timbered walls, and even here and there one still lingers in London or the outskirts.

We have in these later days taken to build our walls of glass, as at Sydenham, and of corrugated iron, as in many temporary rooms and churches, and each has its uses. The newest material for wall construction in England (though not, I believe, new in China and Japan) is paper. At the Health Exhibition a very serviceable little cottage walled and roofed with paper may be found. It is known as the Willesden Cottage, and I think I may say from some little experience of it that its walls are by no means the worst within which I have been sheltered in my life-time. We will now leave the construction of walls and turn to their treatment as an important factor in architecture. A wall, as we look at it, ought to have three parts: Its base, which, though below ground, ought to be represented by some description of plinth or base-moulding; its body; and its top, which may be a coping to throw off water, or may be the over-hanging eaves of the roof which it carries. These, then, are infinitely varied, but they are generally all to be seen in any wall that is architecturally satisfactory to the eye. The different ways of dealing with a wall as an architectural feature may perhaps be grouped as follows:—

1. Emphasizing construction.
2. Masking construction.
3. Varying the outline or plan of the wall.
4. Enriching the surface of the wall.
5. Color.

Of the method of emphasizing construction, which is our first division, a very ancient and obvious one is to use large stones. This was a favorite plan with the Egyptians, and the Greeks, especially in archaic times. Great stones were used in the Pelasgic walls, large remains of which still exist in Greece and in the Etruscan plain in Italy. These stones were usually polygonal, very carefully fitted together, built up without mortar, and they impress the spectator very much by the appearance of savage strength which they present. Stones of very large size occur in Greece and in Egypt, and in Syria stones remarkable for their dimensions and for the way in which their outline is marked round with a broad, round mark.

Another mode of emphasizing construction, which the Jews seem to have taken a pride in, is the employment of large corner-stones. When a wall is built of small or loose materials, it is not easy to make the corner strong; in fact, in parts of England the towers, which would otherwise be square, are round, because there is little else but flint to build with, and with flints you cannot make a square corner. It is usual, on account of this tendency to weakness, to fortify the corner by building it of larger stones or better than others; and the Jews seem to have attached some semi-superstitious importance to the top stone at the corner of a building—perhaps a more really appropriate place for a famous stone than our foundation-stone, which rarely, if ever, is part of the foundation. These stones at the corners come up again in Roman work, and still more frequently in the styles derived from Roman. The famous long and short stones at the corners of Saxon buildings, the well-marked quoins of Gothic ones of all ages, and the carefully-wrought, rusticated, and raised quoins of Renaissance buildings, all go upon the principle of marking construction. In simple and homely structures, built of materials with a fine surface on good color, any method of marking the structure of a wall is successful.

In Cumberland and Westmoreland, where many varieties of stone, rich in color, are met with, the walls of humble churches, or even cottages, are sometimes quite a sight to see and admire, from their beautiful and varied tints, especially if a method of walling be adopted which allows the natural cleavage of the stone to be seen without any tooling. Another and an opposite mode of emphasizing treatment, if not construction, consists in exaggerating the squaring and dressing given to stone, and bringing it to a surface of the utmost smoothness. In the later part of the Gothic period, and in much of the Renaissance architecture which followed it, the whole surface is rubbed, and no trace of the tool is left. The same completeness of workmanship was also to be met with in Greece and in Egypt, and wherever we encounter it the spectator seems to be made sensible of the immense pains and care that have been lavished by the builders upon their wall; and to a less extent the same effect is produced by the selection of materials with a fine texture of surface and a good color, like choice bricks. A wall consists of stones and joints, and one way of marking the construction is to make the joints more conspicuous than they naturally would be. We have seen that in ancient Jewish masonry a drift or breadth of finely-tooled work surrounds the margin of the stone. In some Greek work we meet with a severe square sinking at the joint, and in Roman work with a more strongly-marked channel. There are many other ways of emphasizing construction to which I have not time specifically to allude, but may say generally that any treatment of a wall which makes its materials or its construction evident almost invariably adds a natural and, so to speak, a spontaneous grace to buildings.

WE have heard a good deal about the origin of "Queen Anne," but it has been reserved for the *Athenæum*, in a review in its last issue of Mr. R. P. Pullan's "Studies in Architectural Style," to invent a new and completely original history of the birth of that remarkable phase of art.

"The fact is," says our contemporary, "that as with the Dutch builders of the originals of the so-called 'Queen Anne' types, our architects desired to catch the favor of people whose awakening taste had only taught them to hate the formality of current fashion in design, and, owing to the ignorance and incapacity of the workmen at their command, they were compelled to be satisfied with coarse mouldings and vulgar modes of ornamentation. With the old Dutch builders (one ought not to call them architects whose utmost merit was sincerity) the results of their circumstances were closely analogous to our own. When the Dutch nation had achieved its freedom, the ecclesiastical arts, which had previously been welcomed in secular service (and had fructified in the town halls of Damme, Ypres, Brussels, and less admirably, Louvain), were not tolerated by a race which in the white heat of persecution had become a victorious people. The Dutch nation would have nothing to do with the art of their enemies. When the ar against the hated German and Spaniard was over, skilled craftsmen, with their long-inherited facility and just artistic technique, were simple nowhere. Peace following brought abundant wealth and the never-failing desire to build. The crude skill of incompetent workmen had to be appealed to. The result was that inorganic, blundering, and pretentious style which our popular architects have agreed to call 'Queen Anne.'"

Seth Babson.

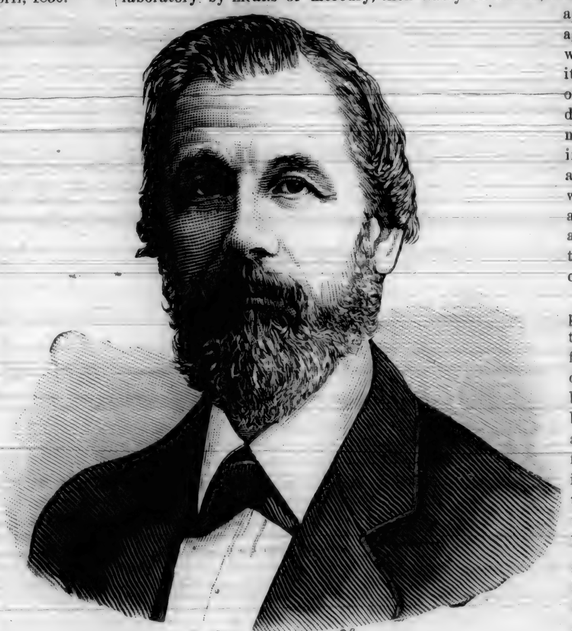
THE subject of this sketch is a native of the State of Maine. Shortly after his birth his parents moved to Newburyport, in Massachusetts. At a very early age he developed a passion for mechanical employment, which, at a later date, developed into a taste for architecture. With his father's assistance (who was a prominent builder), and other professional and practical teachers, Mr. Babson acquired a familiarity with the rudiments of architecture, and at the early age of eighteen, designed and erected several dwellings, and a business block, without assistance from his teachers.

In 1849 he sailed for California, arriving in San Francisco on the 6th of April, 1850.

Shortly after his arrival he went to Sacramento, in which place he remained until 1874. During this period he followed the practice of his profession as an Architect. Many of the finest buildings at Sacramento were designed by Mr. Babson, principal among which were the residences of Charles Crocker, Gov. Stanford, Judge Crocker's Art Gallery and Library, and the Sacramento Savings Bank.

In the latter part of 1874, Mr. Babson changed his residence to San Francisco, where he still remains in the business.

Mr. Babson is an active member of the San Francisco Chapter of Architects.



SETH BABSON.

Timber and Tools

IT is a fact well known to mill-men that it is not always the harder woods, in the ordinary acceptation of the term, that are the most wearing to the saws. Many practical persons marvel at this and wonder to themselves why a piece of timber showing small crushing tension and other strengths, requires more power to work into lumber, and at the same time wears out the saws and cutting tools faster than other varieties of timber, the strength of which, in most respects, is greater. A log of black walnut and one of burr oak of the same size worked into the same sized stuff will show widely different results on both saws and machinery. If we attempt to rive or split these logs, the walnut will work much easier than the oak, and so far as the various strengths are concerned, the oak is superior by far; but when cut into by tools of any description, the walnut will present much greater resistance than the oak, and the same is true as regards many other varieties of hard and soft timber.

If we take a longitudinal section of these comparatively soft timbers which are so hard on the cutting edges, we will find the minute pores or interstices filled with minute glistening particles or crystals, and, subjected to chemical analysis, we will find them composed of silica, one of the very hardest minerals known, while with the hard, easy-working woods, they will be found nearly or quite absent by both the microscope and analysis. These little particles, so finely divided as to be insusceptible of ordinary touch, are really a better grit than ordinary sand, and are the means of cutting off the fine edge of cutting tools, as saw teeth, plane irons, and the like.

Two plane irons, made of a fine quality of steel, as near alike as it was possible for a skilled mechanic to make them, were each hardened in our laboratory by means of mercury, then finely sharpened, so that the edges of each presented precisely the same appearance beneath the magnifier. These were each inserted in an ordinary plane, and one placed on oak, the other on a piece of walnut, both pieces of wood having been previously dressed. At the rate of one hundred pounds pressure, each iron was crowded forward four inches. On the oak stick, the pressure from the rear indicated 809.5 pounds, while with the walnut the indicator showed a pressure of over one thousand pounds. The irons were both now withdrawn, and first placed beneath the microscope; the one used on the oak presented a general upset appearance, the edge of the iron showing a slight tendency to turn downward, there being sufficient heat generated by the friction to partially draw the temper along the minute edge, which, however, would not extend back sufficient to materially affect the wearing and cutting properties of the iron if in constant use.

The iron used on the piece of walnut showed a scratched, notched appearance all along the minute edge, and by the aid of the most accurate means of measurement at hand, these notches were all of the same depth, but different distances apart, proving conclusively that the particles of grit or crystals which caused them, by being harder than the best mercury-hardened steel, were all of the same size and evenly distributed, as far as regards depth of deposit in the grain of the wood. The small spaces of the iron edge between these notches, or scratches, were found nearly as the entire edge appeared originally, showing again that the cellular tissue of walnut, outside its mineral deposits, was really softer than that of oaks, hence, were it not for these deposits, the timber would cut much easier. Of course, if the iron had been drawn back, and again shoved through, the notches would have been more apparent and general, increasing each time, and distance showed until the entire cutting edge had been of itself cut off.

Consulting the laws governing plant or vegetable growth, we are told that all food before becoming fit for assimilation must be reduced to its gaseous state. If this be so, the question arises, How, or by what methods of plant-growth and assimilation, is it possible for silica to appear in its original crystalline state among the tissues of the growing or matured tree? while it is universally known that this variety of wood grows only where this mineral is abundant in some of its modified forms. This, however, is not of great interest to manufacturers, just how it gets there, but that it is present is shown conclusively. To get rid of it, even were it possible, would destroy the beauty and general characteristics of walnut, and to overcome its action on tools, rapid motion and softer iron is the best, safest, and most efficacious method.—*Lumber Trade Journal.*

What is known as French polish is made in a great variety of ways; but the simplest consists of one and a half pounds of shellac, dissolved in one gallon of spirits of wine without heat. Copal sandarac mastic and gum Arabic, are frequently used in making French polish, partly with the view of making the varnish of a lighter color, and partly to please the fancy of the polisher; the proportions of the different gums are varied almost infinitely, but with little advantage.

[Written expressly for this JOURNAL by J. F. ELSOM.]

A SERIES OF ARTICLES ON STRENGTH AND QUALITY OF REDWOOD.

Comparison with Other Woods.

FOR some unaccountable reason our articles on this and kindred topics have gone astray, but we suppose that a profession overworked as the postal authorities have been during the past few months, in distributing such mail matter as would best promote secular interests, have had but little time, and still less disposition, to keep the run of matter which, to them, is of much minor importance. If, however, the average architect may appear a trifle unprepossessing with his apron and business suit when compared to white-handed, well-dressed postmaster, and his dude-like corps of laquays and assistants, nevertheless the architect generally has an intellect sufficiently well balanced to know when he gets what he buys, and is not prone to mingle to any great extent with politicians, at least it is beneath the honor and dignity of a good artisan to become a professional politician, and away up beyond the most presuming aspirations of the professional politician to ever occupy any elevated position among the architects of America. We know that it may be inconsistent with the apparent object of an article with this caption to even speak of politics. Craving pardon then, for this digression, we will proceed to our business. Suffice it to say, that the late presidential contest showed conclusively that much timber used for political purposes in the contest just past, was found rotten to the core, though all the external evidences indicated, when the chips be an to fly, that the timbers of the platforms and scaffoldings were sound, and at the best, indulgent reader, none of it would comparatively, or rather metaphorically speaking, withstand without internal fracture the torsion, crushing, and other important strengths that characterize the redwood of California, about which we now write by means of laboratory data obtained from actual results of tests made for the benefit of our investigating friends.

The strengths of this peculiar and interesting timber are many and varied, and though architects and builders are wont to consider all materials, the strength of which, as compared with such timber as oak, hickory, and the like, has a strong tendency to prejudice for or against, they should bear in mind that not only the compactness but the cellular constructions and molecular cohesion of the particles constituting the wood, exert a powerful influence in furnishing resistance to other pressures. Again, the chemical constituent of wood of various kinds, indigenous to North America and the British possessions, is by no means of secondary importance in determining the value of various timbers for industrial purposes, hence portions of a structure made entirely of one kind of wood, even from the same tree, will be found to show evidences of disintegration, decomposition, and decay much sooner than some other portions. These seeming paradoxes are by no means difficult of explanation when we take into consideration *all* the known features which characterize a given variety of timber. In the spirit of sentiments like, we will add in conclusion that where we subject a given piece of wood to chemical inorganic analysis, we have represented all the constituent elements of the soil in which the tree grew, and its organic elements show conclusively the influences of atmosphere, sun, and rain, to which the external portions were subjected during the various stages of its growth.

In order, then, to place ourself in a position to be understood by all, we made, and are making the tests of other woods than the "red" of California, and by glancing at the results in the following table a comparative estimate of value can be placed upon all timber, insofar as relates to weight, tension, crushing, transverse, torsion, elasticity, and their resistance It will be understood that samples for making these tests were selected at random from the expositions, care being taken to secure like sections, and subjecting them all to the same laboratory influences previous to making the tests.

	Weight Lbs.	Tension	Crushing	Transverse.	Torsion.	Elasticity
Acacia	47	16,000	———	140	———	152,000

Walnut, white	42	8,000	7,000	100	200	———
Walnut, black	40	8,000	8,000	150	130	———

Ordinarily speaking, the foregoing table might be considered as having been carried too much in detail, but if the reader, interested in the qualities of timber, proposes to follow us through, it will be found necessary, quite often, to refer back to this table, as we will not have reason to note figures hereafter. The reader will merely use for future reference.

California redwood, though these tests of various strengths do not strictly correspond with the figures published heretofore, for reasons that different sectional grain was explored as will be explained further on, presents an intermediate resistance to these pressures, and it will be noticed that in some respects it is the superior of oak.

In order to stand a direct pressure from above, a timber must have a compact structure, or what is termed a close grain, else, with this fibrous cellular tissue, is liberally interspersed the air cells, hence by coming together the harder particles or grain being so widely separate, wear and bruise each other; but should we place the timber on what is termed the edge, and then submit the pressure, we find this resistance increased proportionate to the nature of the elements found in these grains. Hence the increase varies in different woods. In the California redwood it amounts to over seventeen and two-thirds per cent., and when a single grain is isolated and subjected to pressure by crushing, the resistance is greater than any wood grain in the entire list, for, as subsequent tests proved, these are composed nearly entirely of gums, resins, etc., put together in such a manner as to furnish great resistance to pressure, in fact four complete sets of appliances were broken before it would crush, and then the indicator pointed to 11.9215 pounds crushing strength to the square foot.

On the strength of this hypothesis, it is reasonable to suppose that when two pieces of this variety of wood or timber are united at the proper angle, it would stand a much greater pressure than many, in fact, most of the hard woods.

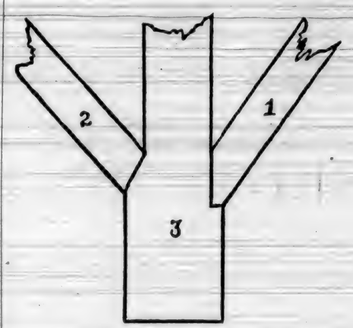

FIG.—No. 1.

It follows, then, that if we use redwood for post and braces, that No. 2, will stand a much greater pressure than No. 1 inasmuch as with the former the grain of the wood came together in such a manner that the entire weight to which subjected will fall on the grain of the timber, comparing the post at the proper angle to withstand an immense amount of pressure direct, whereas with the latter the grains would actually come in contact only at the base, which at the shoulder represents but the merest fraction of the grain surface of the mitre, hence is the only place where an obstacle to direct pressure is met. In any event, we consider No. 1 as being the poorest manner of joint imaginable, but with hard, close-grained woods it might under certain circumstances be admissible. We are not, however, to discuss the merits of joining in this letter, hence will the pertinency of this conclusion to the architects themselves. Assuming that the two joints *were* both right and proper, otherwise No. 2 is about five and one-half times stronger than is No. 1 when both are made of the wood of which we treat.

For bridge building and other purposes where struts, plates, and collar-beams are used, we have obtained the best of results as to the strength of this wood, as compared with all varieties tested. For instance, as will be seen by the accompanying illustration, Fig. 2, there is a splendid opportunity to bring these grains together at the proper angle to ensure great strength; for it will be seen by again referring to the table that all the tests of strength to which the timbers are subjected in this cut, California redwood stands high, and if the logs were properly sawed, that the grains exposed would each run in the same direction, the collar-beam from wood so sawn that the grains would stand on edge, and the angle of the ends of the straining bar where it comes in contact with strut, such that the crushing strength of the latter would form a perfect triangle, in other words, that two hypothenuse basis would be apparent to one perpendicular by all measurements. We venture the assertion that a bridge constructed of this kind of timber would stand if put together in accordance with the foregoing instructions as to manner of joining; would bear as much pressure as if made of any other of the same size and weight, with a very few exceptions.

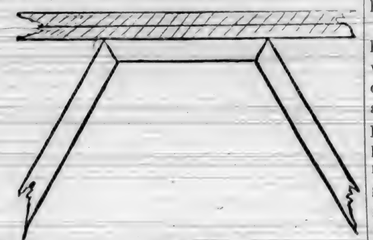

FIG. 2.

By following this line of thought still farther, it is easy to see that the uses of this timber are, to a certain extent, unlimited, inasmuch as it has been shown that under certain conditions its strength can be perceptibly increased. If however, this timber is used on straight lines, the tests show it to be deficient in strength, especially is this true if lain so that the grain recedes horizontal. A piece standing on end shows a fair crushing strength, but is not large; but, all things considered, the very best use so far as we have determined at present to which this wood can be put, when strength is a matter of primary importance, is by means of angles.

In conclusion, California redwood possesses some striking characteristics in the matter of keeping, when exposed. We have no means of knowing by observation anything definite in relation to its lasting properties; proper, nevertheless, analysis of the wood thus far has shown an exceptionally large per cent. of the elements of perservation, such as creosote, gums, resins and the like. So important a feature as this in wood as abundant as we learn this is along the coast, that we have deemed it best to continue the chemical analysis still further, giving actual results, and suggesting the best means of securing the same with profit, as the demand for some of them seems to be unlimited even in California, hence at another time we will beg the indulgence of our readers, while we discuss this feature which is apropos to these articles, especially as we have to make the chemical analysis.

Mantels and Grates.

AN open fire is the soul of the room; it gives it vitality, life; it draws the household around it in pleasant, cosy chat. As the body without the soul is dead, so the room without the fire is dead also. Setting aside for the moment the mere utility of the open fire as a means of ventilation and purification, let us remember that it has its spiritual, its poetical, its æsthetic side, which is welcome to all men. As the soul is beautiful when shining out from a beautiful face, so a fire is more beautiful shining out from beautiful surroundings, and the grate and the mantel become important features in the room. Marble mantels have their beauty and appropriateness in certain places, as, for instance, in vast halls, where grand architectural effect is desirable; but, to our taste, not in a home, not in quiet domestic architecture, not in the family room where the household gathers in the ordinary daily life.

Wood mantels have all the qualities that household use and beauty demand. What a wide range they offer in color, so that all taste can be suited and all styles of decoration find a harmony! We may choose the delicate purity of whitewood, or the golden glow o pine, the fine red of cherry, or purple amaranth, or the rich grains of oak and ash, or the glow and splendor of mahogany, or the dusky gleam of black walnut, or the fine soft finish of birch, or we can bring into our service unnumbered foreign woods to make beautiful the fire-place, and set a fitting frame around our beloved fire.

And just here let one thing, and a very important one, be said: If you put wood into the fire it will burn! Many of our designers of wood mantels forget this, and their florid efforts blister and burn, to the despair and vexation of the careful housekeeper. The mantel shelf on its under side becomes a mass of blisters; the columned or bracketed sides char and blacken, and the open fire, that should give only pleasure is regarded with anxiety, lest it should have in it the terrors of a conflagration. Now all this can be easily avoided. Keep your woodwork within the line of safety. This line of safety is easily determined. We give the result of long years of experience in mantel and grate setting, of a scientific, thoughtful man, and if this rule be followed, it will result in entire safety to the most delicate wood mantel so far as burning is concerned. The rule is as follows: From the front line of your fire draw a line at an angle of about fifteen degrees, and keep all your woodwork behind that line. This is for the sides. For the top draw from the top of the fire-place opening a line at the same angle, fifteen degrees for a foot above the opening, and then change the angle to thirty-five degrees, and keep the mantelshelf and all the top woodwork behind this line, and you will have no more charred and blistered wood, no matter how hot the fire.

In wood mantels every taste may be gratified, the field for design is infinite. The Gothic, the Renaissance, the Colonial, the Queen Anne offer themselves in all their thousand modifications and combinations to suit modern convenience. A half century ago all our houses had wood mantels; it is no new fashion. The colonial mantels were all brought from England, as in fact were all the materials for the house. Many of these houses may still be seen in Salem, in Marblehead, in Plymouth, and in many other old towns of New England. A friend thus describes to us some old mantels which would be the delight of art-lovers of today: "Wooden mantels are no new things. There were plenty before marble was thought of, and were of elaborate patterns. Some fifteen years ago I was present at the demolition of an old house in Maryland, built when Anne was queen of England. It contained two mantels of English oak, one at either end of the large parlor, with enormous fire-places, the mantels covering the entire end of the room with cabinets, and shelves, and cosy nooks, and corners without stint. The pilasters at the lower parts were worn away by the attrition of several generations of shovels, tongs, and pokers which had leaned against them, but otherwise the mantels were in perfect preservation, with joints as good as new. They had a multitude of small, deeply-moulded panels, the product of Anne's time, and the wood was nearly as hard as iron.

"The facings were of large black brick, and no trace of fire was visible in any part of the woodwork, although it had been in use 160 years. The artisans of those times put their lives into a piece of work with far more persistency than is done now-a-days. It must have taken a workman an entire year to make one of these mantels, unassisted by modern machinery." In those days the chimney stack was in the center of the house, often a vast structure in itself, a tower around which the house was built. The fire-places were vast caverns; a tall man could walk into them without bending his head, and they were twelve feet or more in width. It was an old saying that there was space enough for an ox-cart and a yoke of oxen to be driven up the chimney. In some of the old colonial houses still standing in Marblehead and Salem, Mass., there are wood mantels covering the whole side of the room, with delicate mouldings worked in the solid wood, not glued on in the fashion of to-day, the panels enriched with carving of flowers and foliage in the very best style of the art.

To-day comfort has banished the vast cavernous fire-places, but the open fire is just as cheerful as of old, in its more modest surrounding. A half century ago there was a raid made on the old-fashioned wood mantels, and, with all their quaint carving and delicate mouldings and panelwork, they were swept out for kindling wood, and everybody set up in his house the black and gold Egyptian marble mantel. But the reaction has come with an increased civilization, and wood re-asserts itself. Wood mantels, tile facings, and tile hearths are now the fashion, and a beautiful fashion it is. Long may it last.—*Sel.*

Written expressly for the CALIFORNIA ARCHITECT.

Soil as It Relates to Health.

BY GLENN BROWN, ARCHITECT, A. A. I. A.

FILTH IN THE SOIL.

IMPURITIES in the soil are both natural and artificial. Organic matter as found in the soil originates from decayed animal matter, and decayed plants which fall and are mixed with and covered in the soil by the hand of time. According to Lyell, Marsh, and other geologists the remains of animal matter are found in great quantities in different parts of the world.

The ground may become saturated with filth from the leaching cess-pool, so common in some communities, or from leaking sewers. The ground may be filled with decayed matter from cemeteries. In either of the above cases the ground would be fruitful in deleterious matter, which not only might, but most probably would be conveyed into the house, if near the source of contamination, by either the ground water or the ground air. Made ground or soil which is filled in to bring it up to some established grade, is common in most of our cities. When composed of clean sand or gravel there is nothing hurtful in the made ground itself. When these valleys or low places are filled with rags, sticks, leaves, boots, shoes, dead dogs, cats, rats, chickens, and other animal and vegetable refuse matter, then they become dangerous to health. The organic matter will undergo decay, and particles of this putrescent matter will be carried by the ground air directly into our houses.

THE SOILS FILTERING CAPACITY.

The question of how far the soil and the different ingredients forming the earth filter or remove impurities from the ground water and air, is an important one. How far deleterious matter will travel before it is eliminated from the water and air is a most important question.

The National Board of Health, before it was rendered useless by the legislation of a thoughtless Congress, investigated this subject among other important topics connected with the health of the people. This investigation was carried on by Raphael Pumpelly, assisted by Geo. A. Smith. The report of this investigation was published in the thirteenth supplement of the National Board of Health Bulletin. In the following lines I will give a short review of the subject. An illustration of one of these experiments is shown in Fig. 2 at head of next column.

This filter consisted of a column ten centimeters high of sand resting on a copper gauze saucer. The sand was 30° to 50°, and 100° fine, *i. e.*, screened through meshes of the corresponding number per inch. In the bottom of this bent tube was some beef infusion, or some other easily putrescible fluid. Air was made to pass through this tube slowly by aspiration. All the filters tried in this way stood the test, the infusion remaining intact.

The next experiment shows the filtering effect of the soil on polluted water. The columns of sand used in this case were twenty-two and one hundred feet long, of mixed grain 18° to 100° fine. (See Fig. 3.)

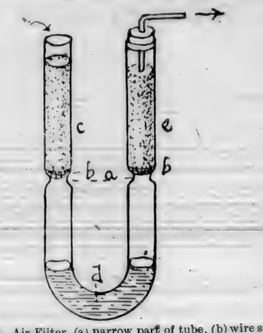

FIG. 2. Air Filter, (a) narrow part of tube, (b) wire saucers, (c, e) sand through which air passes, (d) beef infusion; arrows show direction of air.

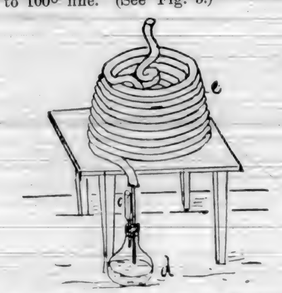

FIG. 3. Water Filter, (c) coil of lead pipe filled with sand, (d) flask with beef infusion, (e) ventilator with asbestos filter.

"To obtain sterilized columns of such lengths the sand was intensely heated and poured into lead pipe which was then coiled. (Fig. 3.) It was then placed in a furnace and heated to within 250° and 300° C., and then the lower end attached to a flask containing the infusion." The flask was ventilated through a tube protected by a sterilized asbestos filter. The whole was then allowed to rest for several weeks, to be sure that the infusion had been properly sterilized. The pipe was then very slowly filled with tap water. The first water that passed through both the twenty-two and one hundred feet pipe or columns carried infection with it.

The inference drawn is that soil is an excellent filter for impure or infected air that may pass through it, but a very poor filter for infected water that may percolate through the soil. The experimenters say: "From these results it appears very clearly that sand interposes absolutely no barrier between wells and the bacterial infection from cess-pools, cemeteries, etc., lying even at great distances in the lower wet stratum of sand. And it appears probable that a dry gravel, or possibly a dry, very coarse sand interposes no barrier to the free entrance into houses built upon them, of these organisms which swarm in the ground-air around leaching cess-pools, leaky drains (sewers), etc., or in the filthy made ground of cities. . . . If the drift of leaching be towards the cellar, very wet seasons may extend the polluted moisture to the cellar walls, whence after evaporation the germs will pass into the atmospheric circulation of the house."

Another series of experiments were made to ascertain the effect of air which either remained stationary or passed in a current over the surface of polluted water. In other words will ground air take infectious germs from the surface of polluted water and carry these germs into the house?

Fig. 4 shows an apparatus by which filtered air (asbestos filter) is made to pass, by aspiration, along the surface of the infected fluid, and then through the pure infusion at the rate of 3½ litres per day. In three flasks after six months the infusion was found intact.

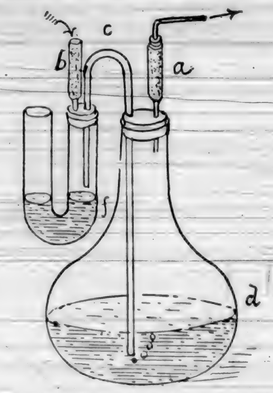

FIG. 4. Air passing over polluted water, (a and b) sterilized filters, (c) tube connecting infected fluid chamber with sterilized infusion, (d) beef infusion, (f) infected fluid; arrows show direction of current.

To try the effect of bursting bubbles on the surface of the water, transferring germs in this manner to the air, other experiments were made. In these experiments "although the formation of bubbles, gentler than in much natural fermentation, the infusion in all three flasks became infected in a few days."

Professor Pumpelly says in conclusion: "At a normal summer temperature *no germs* were given off from the decomposing liquids *whenever their surfaces remained unbroken*, even though in some of the experiments the air was continuously conducted over them in a slow current. When the surfaces of the liquid were broken, however, by the bursting of bubbles, germs were invariably given off and sterilized infusions infected, no matter how slowly the aspiration was conducted."

To avoid the evils described, our building site must be selected with reference to the character of the soil, and of natural and artificial drainage.

Made ground is usually bad, while gravelly and sandy soils are the most healthful. If the soil is damp, or wet, it must be drained artificially. Cess-pools, cemeteries, and other local objects that might contaminate the ground air or water, must be avoided or removed if possible.

The cellar bottom, and the walls of the building to the surface of the ground, should be coated with some such impervious material as asphalt, to keep out the dampness and ground air.

There are many good and many worthless methods adopted for protecting buildings from dampness. A discussion of such details in foundation construction does not properly belong to this article, but the author refers any one interested to his series of articles on Healthy Foundations, which have appeared during the current year in the *Sanitary Engineer* of New York.

These articles discuss, in detail, drainage and foundation construction where it relates to health.

Whims in Building.

NOTHING adds so much to the cost of building as indulgence in whims. To set out deliberately to do a "queer," "fanciful," or, as it is sometimes called, "original" thing in building is always to incur unnecessary expense. If we look through the books that contain pictures of the architecture of all ages and nations, we shall find that, without an exception, in the times all men of taste are agreed in calling the good times, the modes of building have been sensible, founded on the needs of the case, and that whatever may seem fanciful—the whole of what we call picturesque—when its charm has proved enduring, is the result of what we may call, in every case, "accepting the situation." Nothing has been done in such instances for the sake of being picturesque. Good building, good ornament, never poses. In building, as a rule, every departure from the rectangular form is an added expense. One of the things impressed on the mind of a young man who goes into an architect's office to study the profession is that, if cost is to be considered, which it sometimes is, and sometimes is not, all excrescences and projections must be avoided. A rectangular house is the cheapest. Bay windows, porches, octagonal or circular, external ends to rooms,—all these things cost money, and it is by multiplying these features that the expenses of building are often made so great as to deter people from undertaking it, for the things seem so small in themselves, it is not suspected what drains they are on the purse. If a good reason cannot be given for any so-called ornamental feature in a house, if it cannot be shown that something worth while is to be gained by making it, we may be reasonably sure that it is a fancy which will cost, as the country people say, more than it comes to. And in the greater number of cases, nothing, even in looks, is gained by indulging the fancy.—*The Studio.*

Transfer paper is made by rubbing thin, strong tissue paper with a composition consisting of two ounces of tallow, one-half ounce of powdered black lead, one-fourth pint of linseed oil, and sufficient lamp-black to make it of the consistency of cream. These should be melted together and rubbed on the paper while hot. When dry, it will be fit for use.

A Retrospective Summary of the Building Interest of the City of Woodland and Vicinity for 1884.

Marked Example of Steady and Onward Progress—One New Building for Every Third Day for the Entire Year.

Editors of the California Architect and Building News:—Those who have watched the progress and advancement of Woodland for the last decade will see, by the following statement, that the year just closing contains the record of the most substantial improvement and growth since its foundation. The fact of a steady increase of new buildings throughout the entire year is conclusive evidence that the city is unmistakably advancing in permanent population, and is a sure index of a healthy and substantial growth. The increase in new buildings has been principally in dwelling-houses, and while some of the *unpretentious home-made* are not dazzling with an elaborate finish and pronounced complete, having

"No costly ornaments to beguile,
Nor clumsy carvings clog the pile,"

Nevertheless a large majority of all are *fine appearing*, good-proportioned, well-planned and substantially erected structures. Forty-eight from the aggregate number of buildings and improvements have employed the service of professional architects and draughtsmen.

Public buildings are: New school-house, opera house, and convent; to these three add the amount expended for the steam flour mill, and the total for the four amounts to over $100,000. January and May were the two slack months—12 buildings, costing $33,100; April and September the most active (as to cost)—25 buildings, costing $75,415; December the banner month for number—29 buildings. The average number per month, 11; average amount per month, $29.966.20; average cost of each building, $2,703.72. The following is a monthly statement:—

	WOODLAND.						YOLO COUNTY.			
1884.	Frame Buildings.		Brick B'ld'gs		Addn's & Improv'ts.		Frame Buildings.		Brick Build'gs

Tot'l	75	$141,446	4	$37,450	24	$64,353	28	$59,259 75	2	$10,182

Total number Woodland, 103; cost, $243,249; total number county, 30; cost, $69,441-75.

By the above we see the total number of buildings and improvements number 133, costing	$312,690 75
Add to the above sum fifteen per cent. for buildings less than one thousand dollars, and all moderate improvements and outbuildings, barns and carriage houses, etc	46,903 61
Final aggregate	$359,594 36
Total for 1883, 84 buildings, value	$204,519 00
Amount in excess of last year	$155,075 36

A large percentage of the buildings has been expressly intended as permanent homes of those who built and own them, and the immediate occupation is sufficient evidence that no speculative boom has been the moving agency. Therefore we have no occasion to anticipate any disastrous reaction in the future, but work and hope for still better and brighter prospects with the coming of 1885, and may it be a happy and fruitful season to you and the readers of the CALIFORNIA ARCHITECT. Accept our sincere thanks for past kindness and courtesy shown during the year; for the prompt and correct manner in which you have transmitted to the public, through your valuable columns, our monthly statement of building interest, etc.

Respectfully yours, GILBERT & SON.

Woodland, December 4, 1884.

Lining for Chimneys—Browell's Patent.

THERE has lately been patented by a resident of this city an invention that bids fair to make a material change in the construction of chimneys. "It relates to the lining or protection for the interior of flues or chimneys; and it consists of a coat of black-lead, either applied separately or mixed, so as to produce a smooth surface within the flues or chimneys.

"In the construction of chimneys or flues which may be made of brick, paper, terra-cotta, metal, or other material, the interior surfaces are sufficiently rough to arrest particles of unconsumed carbon and leave deposits of soot, which, with some kinds of coal, speedily fill up the flues or chimneys so as to nearly for quite prevent its operation. In order to prevent this, I form a coating for the interior surface of the flue or chimney, which consists of black-lead or plumbago. This material may be applied in various ways. In some cases it may be mixed with water, either fresh or salt, or with other substances, and then applied with a brush or trowel and made smooth. In some cases, as in the building of brick chimneys, it may be mixed with the mortar or cement with which the chimney is lined, and then troweled down so as to produce a smooth surface. If glazed pottery should be used for chimneys, they would split or break when subjected to heat; but by the application of plumbago to the interior before baking a smooth surface will be produced which will not crack. By thus lining chimneys or flues a better draft is produced, the surface will be of such character that particles of soot will not so readily adhere, and where the chimney is constructed of paper or similar substances it acts as a protection against heat."

Jerry Browell is the patentee. He will be pleased to explain the principles of his invention to all who may please to call. We will, from time to time, refer to chimneys erected under the above patent, that those interested may see in actual practice the principles set forth by the claimant.

Builders' Guide and Estimators' Price Book. Price, $2.00.

Architect's Services.

BUILDING gives an account of a recent case, decided in the Supreme Court of New York, in which an architect, who had been employed to prepare plans and specifications for a certain building which was never carried into execution, was obliged to sue for his pay. His bill was two and one-half per cent. for the plans and specifications, and two hundred dollars additional for making measurements and surveys, and for consultations. The defendant seems to have been a prey to the common delusion that if an owner concludes not to carry out the plans made for him, the architect who made them should not expect any pay, and, to judge from the account, urged this as a reason for not settling the bill; but he, or his lawyer, discovering that this plea would not count for much in court, took refuge in a different claim, and represented that the plans were not working drawings, but simply preliminary sketches, and as such should only be valued at one per cent. on the proposed cost, instead of two and a half. Ten out of the twelve jurors are said to have agreed with the architect in his valuation of his work, but the other two objected, and a verdict was at last rendered awarding him five hundred dollars. The cost of the building was to have been twenty thousand dollars, so that this was two hundred dollars less than the amount of the claim. Why the charge should have been cut down we cannot see; and we assure our readers that it is very unusual for a jury to make such deductions from an architect's charges, based on the ordinary schedule. The case, however still serves to illustrate the maxim to which we so often call the attention of the younger members of the profession,—that every man who, at the request of another, does with reasonable skill and care any professional work, is entitled to be paid for it, and can collect his pay by legal means. It is useless for the employer to argue that "he only asked for sketches," and that "it is usual for architects to make sketches without charge, in the hope that they may bring them employment," or that "architect's sketches are always understood to be subject to approval," or that "architects make no charge, if their designs are not carried out," and so on. The fact is that an architect's work is never presumed to be done subject to the condition that it is not to be paid for unless the person for whom it is done happens to fancy it. If an architect is so foolish as to agree in unmistakable language to such terms, he is at liberty to do so; but, unless he is shown to have done so, all courts will hold that he expected to be paid, and that the one who employed him is bound to pay him, whether he likes what is done for him or not. If a man, for instance, wants the privilege of choosing from a number of sketches for a certain building, he can have it by paying a number of architects what they ask for making such sketches; but there is no law or custom by which he can obtain them for nothing, unless those who are to make them expressly agree beforehand to make no charge for them. We are anxious to insist upon these points, as we know something of the experiences of young architects, and are certain that many thousands of dollars are now fairly and honorably due to the more modest members of the profession, which they are kept out of solely on such pretexts as these. Until we can have here some such protective organization as that now just established among the French architects, it would be, perhaps, impolitic to counsel all our readers who may be in such case to fly to the law for redress; but we will, at least, advise them for the future to let no timidity or bashfulness prevent them from giving their clients to understand that under all circumstances their labor is to be paid for. If they wish to enter into competition, there is nothing to prevent them from doing so; but it should be explicitly understood that in such cases they give valuable services at a reduced price in return for a fair chance of securing an important commission. We need not say here what constitutes "a fair chance" in competition; it is sufficient to point out that if fair conditions are required by competitors, the law, which cannot conceive that a professional man in his right mind should give his services without expecting to be paid, will see that they are complied with.

Fight Your Own Battle.

THE question of wages for the laboring man and the advantages he may derive from a trade union, was uppermost in our mind one day last week as we were passing a large work-shop in this city just as the employees quit work for the day. "Hello, boys, how many hours do you work per day, and what do you get for a day's work?" was our salutation, which was followed by a hearty handshake, such as a mechanic only can give. In a few moments there were two or three dozen greasy, dirty, but intelligent workmen around us, all willing to chat a few minutes. The question of wages came up, and every one seemed perfectly satisfied. Their wages and hours of work are regulated by the union. We talked with one man who said he had worked at his trade twenty-seven years. "Then you are a boss mechanic?" we said. "No, I am a blacksmith's assistant," he said. "Well, you must have had a poor boss if you have worked faithfully for twenty-seven years and have never risen higher than a laborer," we said. He was a quiet man, an intelligent looking fellow, and in answer he said: "I have had the same boss for thirteen years, but I never set in to learn the trade; I have just worked for wages!" He was getting $1.35 per day and paying monthly dues to a laborers' union "to protect the laborer in his wages." We learned afterward that the man on the other side of the anvil had only been working at the trade six years, and was getting $4.00 per day. He set in to learn the trade, and he don't need anybody to protect him in his wages. He can get a job anywhere.—*Southern Lumberman.*

The Strongest Part of a Tree.

IT might be supposed, says a contemporary that as every layer from the pith to the bark is in a different stage of perfection, the innermost or earliest being the most matured, would be the strongest, but experience teaches us that this is only true up to a certain period of growth; the greatest strength and toughness lies nearer the more recently formed heartwood, or part nearest the sap-wood. For this reason it becomes a matter of great importance in selecting timber for special purposes, requiring great strength or toughness, to have as little sap-wood as possible and as little pitch. That is to say, cut as near to the sap-wood as the timber will allow, for it should be observed that a tree does not cease growing when it comes to maturity. As long as it is alive it continues to increase in bulk by the addition of the annual layer, but when maturity is once passed, each succeeding year produces a certain degree of deterioration. This decay appears in various stages, and generally exhibits in the first instance, either a white or yellowish color at the butt or root end of the stem. If white, the decay is very slight and does not appear more than a few feet up, but if a yellowish red in color, it is not unfrequently of a most serious character; again, if the affected parts have assumed a decidedly red tinge, the tree is said to be foxy, and scarcely fit for any purpose, as the decay will pervade a great portion of it.

A more advanced stage is that which may be described as a drying up or wasting away of the wood surrounding the pith. It forms a hollow, first at the butt, and then spreads upward, gradually increasing in size as the trees get older, while the defect may eventually reach even into the branches. Trees are most valuable as yielding the largest amount of good timber just prior to their reaching maturity, which is indicated by the topmost branches and branchlets becoming stunted. If, therefore, we wish to select a healthy tree for felling, we must seek one with an abundance of young shoots, and the topmost branches of which look strong, pointed, and vigorous, this being the most certain evidence that it has not passed maturity. When there is evidence of permanent decay in a tree, the best thing to do is to cut it down and convert such parts of it as will answer the purpose into lumber, and the balance into firewood.

A "Jerry" builder having obtained a plot of ground succeeded in getting a lot of building materials on credit; with these he ran up several rickety houses. A gentleman residing in the neighborhood passing with a friend remarked: "Why, what a number of houses that builder has run up, and he is already putting the lights in." "Ah, yes," said his friend, "he does not seem to have had much difficulty with the lights; the job will be to get livers in them."

Detail Cottage and Constructive Architecture. Price, $10.00.

A CARD.

M. B. Richardson wishes to announce to his former Patrons and Architects of this City and County, that he has Gone out of the PLASTERING BUSINESS. And will hereafter follow the Business of Brick Laying, Etc., a Business more Congenial to his Nature. See Advertisement on Page V of this issue.

SPECIAL OFFER.

BOUND VOLUMES OF THIS JOURNAL

TO NEW SUBSCRIBERS FOR 1885.

Upon receipt of $3.25 we will send a bound volume of this Journal of either 1880, 1881, or 1882 and the full year's numbers of 1885.

We have had an extra number bound of the years mentioned, and make this offer to increase our subscription list. We are bound to increase our list, so that the end of the year 1885 will witness not less than

TEN THOUSAND

Paying subscribers on our books.

SCIENTIFIC AMERICAN

ESTABLISHED 1846.

The most popular Weekly newspaper devoted to science, mechanics, engineering, discoveries, inventions and patents ever published. Every number illustrated with splendid engravings. This publication, furnishes a most valuable encyclopedia of information which no person should be without. The popularity of the SCIENTIFIC AMERICAN is such that its circulation nearly equals that of all other papers of its class combined. Price, $3.20 a year. Discount to Clubs. Sold by all newsdealers. MUNN & CO., Publishers, No. 261 Broadway, N. Y.

PATENTS. Munn & Co. have also had Thirty-Seven Years' practice before the Patent Office, and have prepared more than One Hundred Thousand applications for patents in the United States and foreign countries. Caveats, Trade-Marks, Copyrights, Assignments, and all other papers for securing to inventors their rights in the United States, Canada, England, France, Germany and other foreign countries, prepared at short notice and on reasonable terms. Information as to obtaining patents cheerfully given without charge. Hand-books of information sent free. Patents obtained through Munn & Co. are noticed in the Scientific American free. The advantage of such notice is well understood by all persons who wish to dispose of their patents. Address MUNN & CO., Office SCIENTIFIC AMERICAN, 261 Broadway, New York.

MASONS' AND BUILDERS' EXCHANGE

OF SAN FRANCISCO,

Room 11, 314 Montgomery St.

BELOW will be found a list of the members composing this Exchange. Boxes are provided for each member, so that architects, owners, or others desiring the services of any particular member, or those having boxes who are not members, and yet whose business is directly connected with that of the Exchange, can readily secure the attendance of the party sought, by leaving a note in the respective boxes.

LUMINOUS key hole trimmings and door knobs are said to be in great favor with the bibulous inclined person, and convenient for others. They are made of glass, and the back is covered with luminous paint, giving forth a light which may be seen considerable of a distance, on the darkest nights.

THE best arrangement for deafening floors is to have two distinct tiers of beams, one carrying the floor and the other the ceiling beneath. The ceiling beams are set lower than the floor beams, and between them. We then have the ceiling entirely separate from the floor, and there is nothing solid to carry the sound. Where this is not practicable, lay a double flooring with a layer of either concrete or felt between. The concrete will give a better result than the felt, but requires stronger beams. When the sound is to be deadened in the room containing the floor, the felt will probably give the best result.—*Scientific American.*

HELP for working people. Send 10 cents postage, and we will mail you *free*, a royal, valuable sample box of goods that will put you in the way of making more money in a few days than you ever thought possible at any business. Capital not required. You can live at home and work in spare time only, or all the time. All of both sexes, of all ages, grandly successful, 50 cents to $5.00 easily earned every evening. That all who want work may test the business, we make this unparalleled offer: To all who are not well satisfied we will send $1.00 to pay for the trouble of writing us. Full particulars, directions, etc., sent free. Immense pay absolutely sure for all who start at once. Don't delay. Address, STINSON & CO., Portland, Maine.

WIN more money than at anything else by taking an agency for the best selling book out. Beginners succeed grandly. None fail. Terms free. HALLETT BOOK CO., Portland, Maine.

Keep Out the Cold.

CRACKS in floors, around the mould board, or other parts of a room, may be neatly and permanently filled by thoroughly soaking newspapers in paste made of one pound of flour, three quarts of water, and a tablespoon of alum, thoroughly boiled and mixed. The mixture will be about as thick as putty, and may be forced into the cracks with a case knife. It will harden like papier-mache.

$200,000 *in presents given away.* Send us five cents postage, and by mail you will get *free* a package of goods of large value, that will start you in work that will at once bring you in money faster than anything else in America. All about the $200,000 in presents with each box. Agents wanted everywhere, of either sex, of all ages, for all the time, or spare time only, to work for us at their own homes. Fortunes for all workers absolutely assured. Don't delay. H. HALLETT & Co., Portland, Maine.

A PRIZE. Send six cents for postage, and receive free, a costly box of goods which will help you to more money right away than anything else in this world. All, of either sex, succeed from first hour. The broad road to fortune opens before the workers, absolutely sure. At once address TRUE & Co., Augusta, Maine.

BLUM, EPPSTEIN & MARSH.

The California Architect and Building News.

VOLUME VI.
NUMBER 1.

SAN FRANCISCO, JANUARY, 1885.

$2.00 per Annum, in Advance
Single Copies, 20 Cents.

Is the Business Outlook Well Sustained?

THIS is a question that has been repeatedly asked us during the past month, and to it we would simply answer

WHY NOT?

Many seem to think that the building interests of this city were greatly overdone during the year just closed, and that 1885 will fall behind its predecessor in the number of new buildings erected. We can at present conceive of no cause why this should be so, and the principal reason for this conclusion lies in the fact that

CAPITALISTS ARE SEEKING INVESTMENTS

In desirable property, not simply as a speculation, but for purposes of improvement.

CAPITAL WILL NOT LIE IDLE,

And if paying investments on our principal thoroughfares cannot be found, then outside property must come in for its share of recognition. By outside property, we do not mean strictly, land on the outskirts of town; we include all the immense section of the city lying outside of what is generally regarded as our business quarter. And it is on this property that a great change will be made in the next twelve months. The section now occupied by our foundries and lumber yards, has become too valuable to be continued for their present use and purposes, and the space must give way to new interests.

THE BOUNTIFUL SHOWERS

Of the past four weeks have given an unusual impetus to farming operations, and from numerous valleys is heard the call for more help. We are well pleased to hear that our pastoral population is crying out against the "one crop" system that has been so prevalent in this State since its formation, and in the future we expect to see a much more diversified system of farming.

Taken altogether we see no reason why the building as well as the industrial interests of this coast should not fully equal in activity the year just passed away.

Building in the City.

A CAREFUL study of our building intelligence reported this month will serve to prove our assertion in regard to a continuance of building operations. Since our last statement, more than one-half of the days have been such as to stop operations almost completely on account of rain, and yet we find more buildings and of greater value started than for any similar period of which we have a record.

The following table will show the number and value of improvements started since our last issue:—

	NO.	VALUE.
Frame buildings	62	$247,320
Brick "	2	314,000
Alterations	9	41,265
Total	73	$602,585

In regard to our quotations, we would again call attention to the fact that we print on the fifteenth of each month, and consequently our advices in regard to improvements extend from the fifteenth of one month to a corresponding date in the following. It is important that this fact should be borne in mind.

Market Reports.

IT is impossible, with the exception of a few items, to quote definite prices for materials used in building.

BRICK are firm in price. Pressed are worth from $55.00 to $60.00. Hard burnt, $11.00. Softer grades, $7.50 to $9.00, according to quality. We do not apprehend a reduction in the near future.

LUMBER may be quoted at $14.00 to $18.00 for rough and $25.00 to $35.00 for surfaced. The market, although weak at present, has an upward tendency. No fear, however, need be felt that the exorbitant prices of last year will be realized during 1885.

HARDWARE.—A general upward tendency is being experienced in the different branches of the hardware trade. As a rule, prices have been TOO low; for, although a few on this coast have been benefited by the extremely low rates quoted, still thousands in the manufacturing districts have been thrown out of employment on account of the general depression. We regard it as one of the anomalies of the season that, in spite of unprecedently low prices, there has not been an extra demand on account thereof, and our country merchants have not signified their intention as yet to take advantage of the low prices now ruling, although there is a positive upward tendency to the market.

LIME, LATH, CEMENT, ETC., remain about the same. All the lath coming into San Francisco are substantially under the control of two firms. This will account somewhat for their steady price.

Our New Heading.

WE point with pride to the new design we present as our title on cover. Many other improvements will follow, as we are determined that this Journal shall equal any now printed, both in artistic beauty and the merit of the articles presented.

The Prompt Payment of Subscription to This Journal is Requested of those who

HAVE NOT PAID UP.

We acknowledge the promptness with which a large proportion of our patrons have responded by the payment of subscription amount. Those who have not, will do a right and proper act, and will greatly oblige by availing themselves of the earliest possible opportunity to call at the captain's office and settle—or by postal order, or otherwise, relieve themselves of the burden that must rest upon the mind and conscience of every intelligent reader who understands and realizes the amount of labor and cost involved in producing a Journal of this character.

ALL WHO HAVE NOT PAID, OWE $2.00 for 1885, and delinquents who have forgotten their obligations for 1884, will but do an act of justice to pay up promptly all arrearages, and the amount due in advance for the current year.

Our Sixth Volume.

WITH this issue we begin our sixth volume. Our *seventh* volume would be more correct, as this Journal was published during 1879. We do not give credit to the latter named year, as we then used for our title, "THE ARCHITECTURAL REVIEW." In January, 1880, we adopted the broader and more significant title, "CALIFORNIA ARCHITECT AND BUILDING REVIEW," changing, after a few months, "REVIEW" for "NEWS," and commenced to number our Journal from the date of the adoption of the title now in use.

We sincerely thank our friends for the kind patronage bestowed during the past six years, and promise, on our part, to put forth renewed exertions to make this Journal worthy of the support it has received.

California Designs.

HAVING finished the series of competition designs, we will commence again in our next with sketches of California architectur .

Readers of the "CALIFORNIA ARCHITECT" will confer a favor upon the publishers, and derive material benefit themselves, by mentioning this paper when opening correspondence with advertisers. Drop us a postal card when you have written to an advertiser, give us his name, and then we will put you in the way of getting the benefit. Don't forget this.

Questions Concerning Chimneys.

THE following questions respecting the construction and operations of chimneys, with the answers thereto, are taken from the *American Architect*:—

Questions.—1. Do gases resulting from combustion contract or expand when rising?

2. Should the flue of a high steam chimney be of the same area throughout, or gradually increase, or gradually diminish as it approaches the top?

3. Would it be advisable in any case to suddenly flare or contract the top of such a flue?

4. Would the same treatment apply to the small chimney of a house?

5. Is it preferable, as regards draught, to carry the flue of a house chimney vertically to the roof, or to give it an oblique, undulating course?

6. What is the proper area of flue for an open fire-place, 3 feet 6 inches wide, and 2 feet 6 inches high?

7. If a 12-inch circular flue would allow sufficient area for a given amount of smoke, is there any objection to making the flue 12 inches square, and has the latter arrangement any merits aside from economy of construction?

8. Is an 8x8 inch flue large enough for an ordinary coal grate?

Answers.—1. Gases generated in a confined space expand on emerging from it, but contract again subsequently as they lose heat.

2. In theory, the flue of a steam chimney should be cylindrical, and of the same area throughout. In practice, however, it is now not unusual to increase the area slightly with the height, at the rate of perhaps one additional inch of diameter for every twenty-five feet rise above the base, and the effect is thought to be good.

3. If such a flue were of sufficient capacity throughout, it is very doubtful whether any advantage could be gained by flaring at the top, although, if the flue were originally too small, a little improvement in the draught might possibly be gained in that way. In many cases, a cowl is placed over the top of the chimney, which, of course, contracts the outlet nor does it, without material disadvantage.

4. The same principles apply to small as to large chimneys.

5. For draught it is almost best, unless the flue is large, to carry it up as nearly vertically as possible. If the chimney is exposed to down draughts from higher buildings or hills in the neighborhood, or if it is too large for its work, change of course may help to check downward currents, and such deviations from the vertical line help to prevent the fall of soot in summer from the chimney into the room.

6. An open fire-place three and one-half feet wide, and two and one-half feet high should have a flue 12 inches by 24 inches, or 16 by 16 inches, if possible, although a flue 12 inches by 16 inches might do, if carried up nearly straight.

7. There would be no objection to using a 12 by 12-inch square flue instead of a circular one 12 inches in diameter. The circular will, however, be rather the better of the two, as being less liable to down draughts.

8. An 8 by 8-inch flue is too small for a soft-coal grate, except, perhaps, one of the miniature English ones. For hard coal or coke it may be made to do, if the chimney is high, and the flue straight; but 8 inches by 12 inches would be much better.

How to Make Wood Present a Fine, Smooth Finish.

IN going through some of our better class of houses, it is often noticeable the different degrees of smoothness and finish in various parts of the painted and varnished work. For instance, the architraves and other finish of the parlors, dining-rooms and principal bedrooms, will, if the hand be gently rubbed over the same, present a surface smooth as ivory, while that of the smaller rooms will feel a little rough, although presenting a polished surface. The difference between the two, admitting that the same amount of hand-smoothing and sand-papering have been applied to the finish all over the house, lies in the fact that in the principal rooms, the wood was first filled with *Wheeler's Patent Wood Filler*, consequently all the pores of the wood were filled, and thus a perfectly smooth surface was obtained. We are pleased to say that this *Filler* can be obtained at nearly every paint store on the coast, so that no reason exists why all the wood work of your house should not present a perfectly smooth, polished surface.

Back Saws.

BACK Saws are getting out of use simply because they cannot be kept straight. After a back saw has been used a little, it is very common to see its owner, on taking it to use, "hit it a whack on the middle of the back" to get it straight. This oftentimes does about as much good to the saw as the "meat cutter" does to his knife when he draws it across his steel. Both cases are done more through habit than the real good of the thing.

There is a way, however, to fix a back saw so it will always keep straight. The way to fix the saw is this: first, take the handle off and shove the blade into the back so that the back will cover the saw at both ends not less than three-eighths inches; then drill a hole through the back at one end and in the middle also. Put a rivet in the middle hole, then tilt the back so that the other end will go onto the saw one-sixteenth inch further, drill a hole then and put in another rivet; then force the saw into the back at the other end until another rivet can be put in; then put the handle on and the saw is done, and will take seven times as much pressure to get it out as straight as before. It costs twenty-five cents to fix a saw in this manner. E. H. DAVIES.

Santa Clara.

Editors "California Architect:" Kindly explain to me the difference between a "Fish Joint" and a "Scarf Joint." T. M. K.

Ans.—When the beams abut end to end, and are connected by pieces of wood or iron placed on each side and firmly bolted to the timbers, the joint is called a *fish* joint. In a scarf joint the pieces overlap each other, and are bolted together. The form of lap depends upon the kind of strain to which the beam is to be subjected.

Wash Bowls.

WE have received several communications from those presenting plans in the late competition given under the auspices of the editors of this Journal, in regard to the remarks made by us upon the *lack of wash-bowls* in any of the bedrooms. We have been assured that it is not customary in country dwellings to specify wash-bowls, where the amount is placed at *about* $5,000, for which sum the building must be completed.

We can assure our competing friends that there was no intention on our part to unjustly criticize any one presenting plans. Our remarks were altogether made from a California standpoint, and we only recorded such suggestions as would naturally present themselves to our subscribers on this coast, knowing that their views would coincide with our own, in regard to the lack of a *necessity*, as far as the people are concerned on this side of the Sierras.

Queen Anne Architecture.

A RECENT writer offers a few reflections on the caprices developed by the mania for Queen Anne houses. He says: The thing is all wrong and on wrong principles. The Queen Anne architects indulged in no such freaks as we see now exhibited, and simply because such was entirely opposed to the nature and character of brick. Brick is a simple, honest, plain material, with a good color, and hard, smooth surface—that is all. Whatever style can display these qualities best is the Queen Anne style and no other. The result of the modern caprices will be seen ten or twenty years hence, when certainly decay will have disintegrated or destroyed the whole, or when the owner's heart will have sickened of the frequent repairs and restorations. The old Queen Anne houses produced effect by the beautiful color and surface, the bricks being laid almost touching, the thinnest wash of mortar between. The result is that no damp ever gets between. The modern system of building is opposed to this, thick layers of mortar being interposed, with the certain result that all the elaborate gables, etc., soon begin to separate. Bricks put together in elaborate forms have no strength, no more than stones laid on earth, but displayed in surface become as firm and smooth as a billiard table. Even mouldings should be raised in the faintest degree, and the less they are the richer the effect.

Our Illustrations.

IN our last four issues we have presented the plans of those to whom were awarded the premiums given by the Proprietors of this Journal for the best display of genius in designing a house for a country dwelling costing *about* $5,000.

We have emphasized "*about*," for the reason that not a single plan presented could be built in *this section* for the sum specified. This fact was taken into consideration by the committee appointed to determine the merits of the various designs, and the question of *cost* was left entirely out of their calculation, the *merits* of the various plans being the criterion upon which their decision was made. This was only just to all parties—ourselves included—and we have presented the plans according to the merit bestowed upon the same.

In our initial number of the new year we reproduce the plans and elevations of "Tease Quare." Under this *nom de plume* credit belongs for the same to Oliver C. Smith, Cincinnati, Ohio.

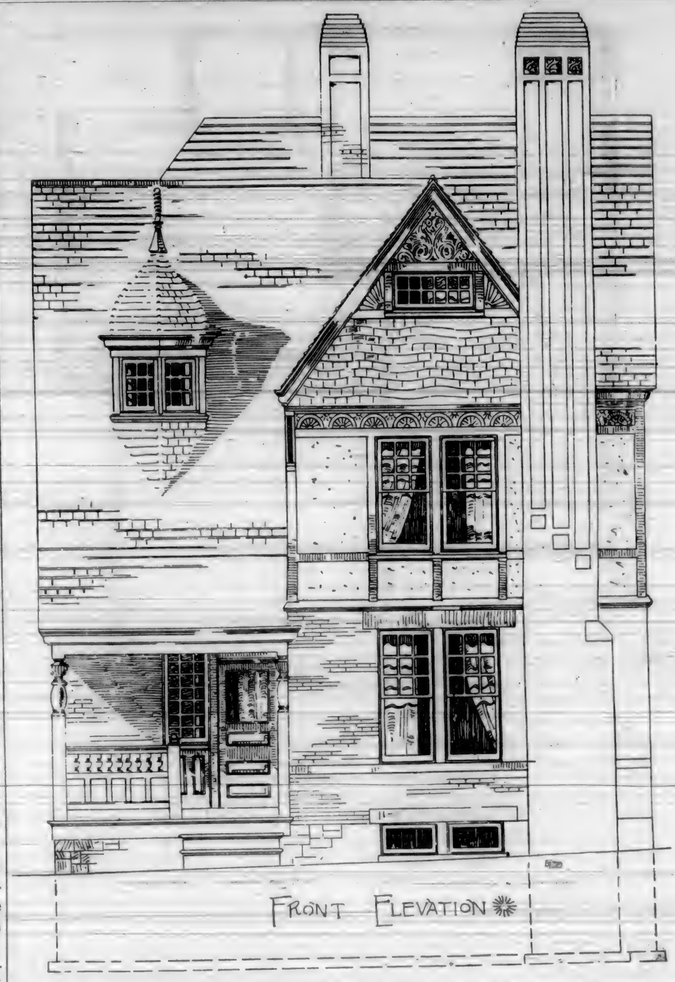
The elevations are somewhat different in character from the style generally adopted on this coast, although, in certain sections, the picturesque appearance of the exterior would no doubt form a pleasing contrast to other buildings in its neighborhood.

The architect evidently has endeavored to follow one of the ideas of the profession, namely, compactness. The entrance hall is spacious, and from the same access can be had to every room on the first floor. The parlor is large; arrangements of the kitchen and dining-room are convenient. Fault can be found with the cellar entrance opening directly into the latter room.

The arrangements of the second floor, attic, and basement are very distinctly shown by our engravings.

We give in full the estimate of cost and bill of quantities, as furnished to us by the designer. It will be noticed that many of the items are much below the cost of the same in this city.

We also notice in this plan a lack of wash-bowls in any of the chambers; this fact we noticed in our remarks on the various other plans presented. We have been assured, however, that it is not customary to specify wash-bowls in bedrooms, where the amount is limited to that shown in the estimate presented; that is to say, in the sections of country in which were designed the various plans presented in the first architectural competition held under the auspices of the Editors of this Journal.



FRONT ELEVATION OF "TEASE QUARE'S" PLAN FOR A $5,500 COUNTRY DWELLING.—SEE "OUR ILLUSTRATIONS."

BILL OF QUANTITIES.

FIRST STORY OF "TEASE QUARE'S" PLAN FOR A $5,500 COUNTRY DWELLING.—SEE "OUR ILLUSTRATIONS."

To Imitate Furniture Wood.

AFTER the color has been applied to the panel, take a large dusting brush of the kind used by painters, and, working the reverse way of your color, lightly pass over the surface with the tips or ends so as to blend together, as it were, the light and the dark. Quickness of manipulation is essential to obtain the desired effect while the color is wet, for it dries or "sets" very quickly. Use judgment in passing over the work, so as to vary the "beating" by turning your hand according to the various directions the veins have taken when first laid on.

Next take a piece of wash leather, damped and folded, to form a round, elongated edge, and proceed to wipe out all the light parts lying between the heavy color; then with another piece of leather fastened onto the end of a stick, and brought to a point like a pencil, proceed to cut out all the finer lines. If you find that your color sets while working, you must dab it on the surface—not rub it, else you will probably wipe off all the color. As soon as the panel is dry, you can, by the means of a flat fitch, proceed to put in all veins (or "worms" as they are sometimes called) which cross the grain, by using a little burnt umber diluted with beer to the necessary tint. If you want the work to have dark shades on its surface, then you must work in a little Vandyke brown. These dark shades and veins can be formed with a camel's hair or sable pencil, and blended together with the badger.

Passing on next to mahogany, we shall see by examining a piece of Honduras wood that it is much easier to imitate mahogany than oak. When the ground color is thoroughly dry, smooth and level the surface so that the brush marks shall be hardly discernible. Attention to this point will materially contribute to secure a good imitation. After this, proceed as before to remove with a damp wash leather all grease and dust. You will be able to judge whether the surface be free from grease or not, since no moisture will be absorbed by such spots, but they will appear dry and shining. If necessary, you may use soap and water. Some grainers will even rub the surface over with whiting and water, which has a good effect. Having prepared some Vandyke brown ground and mixed in beer, proceed to thinly spread it over the work, and while the color is quite wet freely dab a piece of sponge over it to gain the effect of light and dark shades, at the same time drawing the sponge a little. With your "softener" proceed next to blend the edges of the dark into the light shades, so that the eye may not perceive any broken lines or edges, and toward the finish use the softener (or badger) in the direction of the grain, or rather in the direction in which the dark veins of the mahogany are intended to run. When the work is dry, get a tint of Vandyke brown ready, and with a tool filled with a little color from the lightest of the dark veins or shades, using a drier brush to obtain the effect of a kind of over grain. These veins ought to run in the direction of the light above and below it. A little practice will soon familiarize you with this process. To gain a nice rolled mottle, as it were, a light dab of color must be given just under the lightest portion, so as to render it solid and opaque. Next blend all well together, which can be done, in the first instance, by means of the dusting brush before mentioned, while the badger may be employed for the finishing touches.—*Manufacturer and Builder.*

Chimneys.

A SOUNDLY built chimney vibrates, or swings from side to side, as a whole, under sudden and violent shocks of wind, and is in reality safer when it does so than when it stands in sullen and unmoved resistance. The vibration indicates that the several constituent parts of the structure are firmly compacted into one coherent, continuous, and, as it were, homogeneous mass, which can sway from side to side like a steel rod or spring, without any tendency to dissolve its continuity and break asunder at some intermediate point.

The absence of vibration, on the other hand, means that there is not this integrity of coherence, and that there are, so to speak, fissures of substantial continuity in the structure, at which disruptive strain is unavoidably developed. Sudden shocks of wind bursting upon lofty columns of brickwork in such circumstances tend to break them across at the joints where the interruption of continuity occurs. The movements of vibration are there absorbed, and converted into the less desirable condition of molecular strain.—*Scientific American.*

New Way to Lay Slate Roofs.

A NEW kind of slate roofing has come into favor. Each slate is laid in a peculiar kind of cement, consisting of liquid coal tar thickened with a cement, or, better still, a quantity of ground slate, slacked lime and linseed oil, the proportions varying according to the requirements of the case. This substance is heated until liquid, poured on a shed roof and the slates embedded in it with their whole face exposed. When of just the right thickness, the compound adheres with extreme tenacity to the slate, and cannot be detached without violence. The cost of a roof of this kind is said to be less than one of tin, and, on account of the greater surface exposed, is considerably cheaper than ordinary slate roofs.—*Ex.*

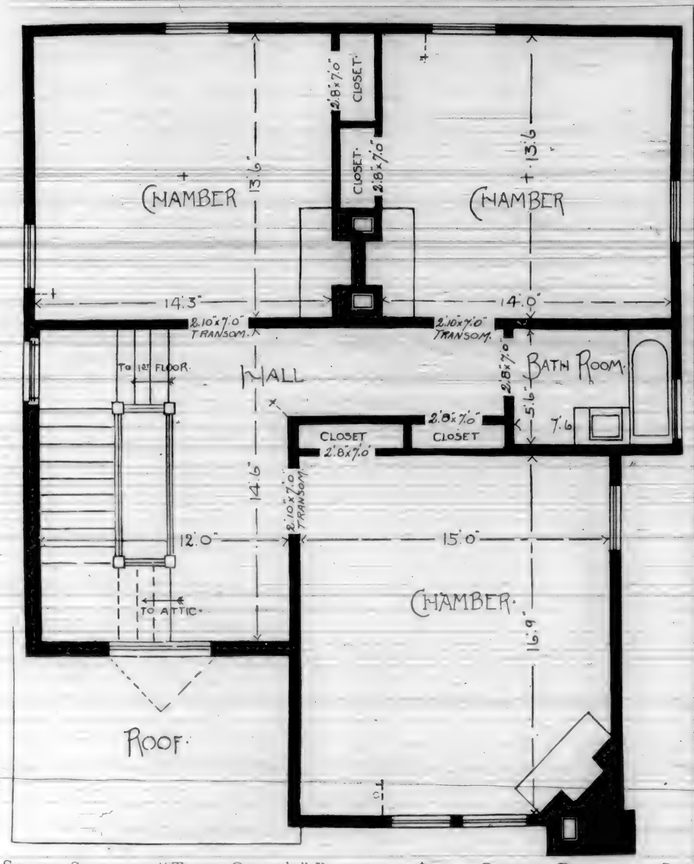
*Mechanic, Take This Home; Read To-night.

FOR a long time past we have had the pleasure of addressing ourself particularly to the mechanics in the shops, but inasmuch as we shall not appear before them again this year, we propose to go with you and remain awhile in the sanctity of Home. The year we have traveled through together is nearly gone, and will soon be numbered with its predecessors. Many of us have reason to be merry and glad, others are borne down with grief, and with hearts bleeding and torn enter sorrowfully the glad new year by the side of the merry and gay. For once let us bury our sorrows in the graves of the past; and, dear friends, let us dig the grave deep and wide, pile it wide and high with the beautiful soil, and strive to heal the wounded heart in forgetfulness. We know how hard it is, for one year ago we placed beneath the clods of the valley an only beloved daughter, and when the waves of memory backward roll, the heart and mind will dwell on the vacant chair. But let us all forget what has been; let the little dead slumber silently, and we all will look forward to the future, and center our hopes and aspirations on those who are with us yet.

We have no high-sounding platitudes, no brilliant rhetoric bespeaking the dawn of better times, no political harangue that the party in power will make the rich poorer and the poor richer. Those who have been disappointed in their choice seek consolation in

*This article should have appeared in our December issue.



SECOND STORY OF "TEASE QUARE'S" PLAN FOR A $5,500 COUNTRY DWELLING.—SEE "OUR ILLUSTRATIONS."

the thought that after all this is a grand and noble country. Here we do not yield a neck for the iron heel of bigotry or strutting aristocracy. We have no hereditary titles handed down from father to son. We are *freemen*, and the resources of this country are beyond the reach of men or set of men to paralyze. Times will continue hard, if we are hard ourselves. Mechanics have had economy preached to them till they are weary. We say first, if you have had a clashing of prejudices during the past year, go bury them in the grave, and dig it deep and wide, and then seek happiness, and the means of increasing the happiness of others. Some say, Do not smoke; it prevents buying a home. We say, If you enjoy your pipe, smoke it; but, kind reader, fellow-worker, do your smoking at home, among the loved ones there; for, candidly, we cannot see how smoking a pipe or so of tobacco will prevent paying off the mortgage on your home. Sitting around the saloon and grocery, where smoking means treating, is where the cost comes in. Others say, Do not drink. This is all well enough, and we say so too, when to drink means a slave to the sottish vice; but, if you feel tired and weary to-night, and are determined to have a nip, take home a small pitcher of beer, and drink with your wife at supper. This will cost you ten cents, and you know this amount will not begin to pay the treats when in the saloon. These things we do not advise, but if you must have them, stay at home and enjoy them; but, after all, they are of no real use to you, and the money spent for them can be put to much better use. Others advise avoidance of cards. If you can find nothing better, why play a rubber or two of euchre or whist. Ask Brown, whose hens scratched up your garden, and whose clothes were torn by your pup, to bring his wife over and have a few games; but better not spend too much time even at this amusement. Current literature is cheaper and much more satisfactory, especially that literature which discusses any department of the calling you pursue. But there are too many demands upon the social features of father and husband to allow him the entire evenings for reading. Still others say, Avoid the theater; they are demoralizing, and give one a superficial idea of the stern realities of life. We are tired of this preaching. When working for $15.00 per week, we occasionally went to the theater, and saw lots of good as well as bad folks there. All have enough of the stern realities, and the theater illustrates what we had better shun; often shows how to shun them.

By all means go home; be at home all you can; but when you think you must go, take some of your own folks with you. If there is any one word around which cluster pleasant associations, it is the good old Saxon "ham," anglicized "home." In the original it meant a retired, close, and secure place; in the ordinary acceptation home means where the loved ones are, where the family is kept. And of all the homes of America, give us the quiet, neat cottage of the artisan for comfort that is real, for love that is pure. It is not among these where we look for petty jealousy and competitive strife, but amid the palaces of pomp and splendor where Mr. and Mrs Nabob, aided by all that's theirs, strive to outbid their neighbor in splendor and gilded trappings. We claim to be in position to know this stratified condition of society well. Above and below the artisan is where real crime ends and begins; but with the artisan his home should be his castle. The Frenchman speaks of his *maison*, but there is no French word for home; indeed, the French in France do not need the word, for anywhere but France is emblematic of home in the fullest sense. The *maison* may be large and elegant, furnished with all the splendor and luxury that wealth can supply, but if family ties and affections do not center there, it is no home; for, as has been well said, home is where the heart is.

Again, the lovers of home are better workers. For years we have been thrown in contact with the largest factories in the land, and we have no hesitancy in claiming that in looking through any such, the lathes, vises, drills, presses, and the like, have that tell-tale look which tells one in tones not to be misunderstood who of all their occupants by day live at home by night; and the work turned out of any shop is an almost infallible criterion of the social condition of the artisan who is responsible for its character. The home and its influence leaves its impress here as elsewhere.

In conclusion, above all things be happy. Many of you are parents; we wish to say to all such, and others in household authority, cultivate the home feeling in all the members of the family,—the children, the hireling, and the stranger within thy gates. Your family should be a unit, all the members sharing each other's joys, and sympathizing in each other's sorrows. The happiness of life is thus increased in geometrical ratio, and at the same

time the burdens are decreased to the minimum. This home of which we write is in your hands as well as that of the mother. Your children, as well as ours, are the closest of imitators and accurate observers. They know whether father and mother are happiest at home and in the family circle, or with strangers in the glittering den around the corner. If they hear sharp and angry expressions in the intercourse of their parents, they will use the same in their intercourse with each other, and this, too, in spite of all parental precepts and penalties.

Finally, when the home is left in the morning, see that your employer knows you are working for his interest, that then home comforts will follow; for, notwithstanding all that has been said of the grasping tendencies of wealth, there are but very few owners and operators of manufacturing enterprises who do not enjoy the sight of a shop full of happy workmen fresh from the hallowed precincts of home; and few indeed who will not aid and abet the worthy employe in realizing his fondest hopes as regards the possession of a happy, contented household. And our word for it, as time rolls on you will see many favors extended you by them, if they see you are on the right road, which otherwise would be withheld. As we enter this new year, let us see how many strikes can be averted, how many homes made our own. J. F. ELSOM.

What Is an Abstract of Title?

BUT few property owners know, perhaps, what an "abstract" is. A good many are still of the opinion that the possession of an abstract is evidence of the genuineness of title to the property.

This is a fallacy. The more complete the abstract sometimes, the greater the uncertainty of the title. The paramount consideration is: Is everything in the abstract correct according to the law, and is the property free from encumbrance, so that the title is unassailable?

An abstract is a careful abstract from all the various contracts, bills of sale, powers of attorney, deeds, mortgages, trust deeds, and releases, also all legal and testamentary transactions affecting the property right of the owner. Also are shown all sales for taxes, judgments and order of courts against previous and present owners.

By the aid of a complete abstract the expert must determine the genuineness of a title, and in case of unpaid mortgages or errors and flaws in former sales or court transactions they should be straightened out at once. All this ought to be done before a purchase or loan for the safety of buyer or lender. Where this was neglected at the time the error ought to be remedied as soon as possible, because the older an imperfection or flaw in the title is the more troublesome and expensive is its rectification.

The labor, therefore, of examining abstracts and proving titles is a difficult, tedious, and responsible one, and the greatest care and long experience is necessary to elucidate the various questionable points which may arise in the proving and examination and to pass his opinion upon the same.

Persons who wish to follow this branch of business and expect to meet with success must, above all, have the entire confidence of those who lend property or lend capital upon the same.

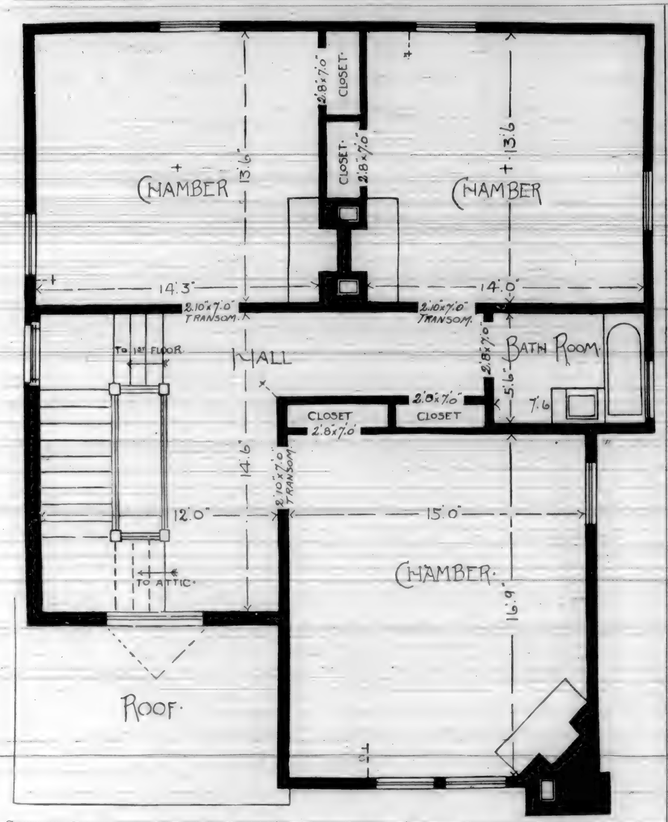
A Perplexing Situation

NOTHING like the existing state of the breadstuffs market throughout all grain-growing countries has ever been known since production and prices became a matter of statistics. What has caused it, and when and where it will end, are questions from which the most profound theorists are inclined to retire, and wait for the course of events to shed some further light. Even the *Northwestern Miller*, which is not wanting either in foresight or the logical faculty, gives up the conundrum, thus:—

The present condition of the grain and flour markets of the world is likely to long be noted as the most anomalous and striking in the history of the commerce of this century. It has been the case heretofore that crops were abundant the world over, yet prices of cereals and their products are now below the lowest points reached in the eighteenth century, and the cry of dullness and unprofitable agriculture rises from every land under the sun. Such a situation has a meaning which the wisest are vainly endeavoring to elucidate. Theories and predictions are plentiful, but events as they occur prove the intangibleness of the one and falsity of the other. Prices tend steadily downward, the monotony being scarcely broken by occasional spurts which seem to exhaust those who make them, and leave them each time weaker than before. Months ago it was announced that the bottom had been reached, but there have yet to appear signs of a bottom, so far as prices are concerned. Now more than ever is it true that one man's prediction is as good as another's, and until some certain signs become visible, it will be well for market prophets to hibernate.



SECOND STORY OF "TEASE QUARE'S" PLAN FOR A $5,500 COUNTRY DWELLING.—SEE "OUR ILLUSTRATIONS."

the thought that after all this is a grand and noble country. Here we do not yield a neck for the iron heel of bigotry or strutting aristocracy. The Planning of Houses.

A HOUSE, to be well planned, should be useful and convenient for carrying out domestic arrangements in the simplest and easiest way. The necessity of the architect making this his first consideration is very obvious. A thing to be of the highest value must be useful, and nothing more so than the houses we live in. A house should be arranged so as to suit or even improve the habits of the people who live in it. It should also be a healthy house, otherwise it sadly fails in that which a habitation ought to be. In the matter of convenience and completeness, it should be self-contained, both in and out. This should be striven for in designing houses of all classes, but especially those of the lower. To have one room entering from another is bad planning, and should be avoided. In cases of sickness or privacy it is very objectionable.

If a house is contrived, to begin with, so that it is deficient in that which provides for ample light, ample ventilation, and good drainage, it gradually becomes a diseased house, which nothing will cure, and I cannot impress too strongly the need of designing houses which will prevent as far as possible that share in the death rate of our city which unhealthy houses lead to. There can be no doubt that a house that has been subjected to the escape of bad air, the soaking of the basement by leak-drains passing under the building, has the living germs of disease about it, and I cannot state this view too forcibly, as in my opinion there are many such houses in our city, which throws a heavy responsibility on those who had to do with their imperfection in this respect. Drawings of drainage, showing accurate line as well as the course of bends and level, should be as carefully done as any detail of the building.

Besides having the rooms self-contained, the staircase or lobbies should be wide, airy, and well lighted. They are the lungs of the house or building. A narrow, dark, badly ventilated staircase is fruitful of disease, and so is the lobby. At the present moment I see tenements of houses being erected which are sadly defective in this way; by whom planned I know not, but they or the authorities who permit their erection have much to answer for. It is difficult to understand how the authorities can allow tenements of houses to be erected having narrow, dark staircases, water-closets in the center of the building, lighted from the staircases, and with attempted ventilation by a pipe to the roof, which is more likely to supply air to the heated house than draw the vitiated air from it, besides the danger of allowing the air of one house to pass into another, and so propagate disease if such should exist in the building.

Healthy and unhealthy houses, individually or in groups and districts, are perfectly well known to medical men, and it is matter for consideration whether these should not in some unmistakable way be specially distinguished. The effect of this would probably be to bring those who own such houses to see it to be their interest to make them properly habitable.

In the selection of houses a cheap rent is often a great inducement, even to those who can afford to pay on a higher scale; but if this is done to the neglect of sanitary arrangements, it becomes foolish economy, as much more may have to be paid for doctors' bills than would have to be expended for better accommodation, apart from the suffering from ill health and its consequences.

In the choosing of houses we are not so concerned for those who have the means, and ought to have the knowledge, to enable them to select a healthy residence. The class we are sorry for are those who, from limited means or circumstances, cannot pick and choose, but must take what is offered to them, whether healthy or no; and I would point to the need of all proprietors having their houses certified as to their healthiness. If the legislature provide for the safety of sailors in seaworthy ships and the protection of miners in dangerous mines, action in the direction I have indicated is not less but even more urgently needed.—*J. Gowans, in Carpenter and Builder.*

Useful and Practical Hints for the Artisan and Mechanic.

WOOD may acquire an oak, walnut or cherry tree color by staining it with ordinary tincture of iodine diluted with spirit until the exact shade is obtained. White shellac must be added to the iodined solution if the stain is to be made permanent, or the wood after the stain is applied may be French polished. The iodine may be laid on with a rag or a brush.

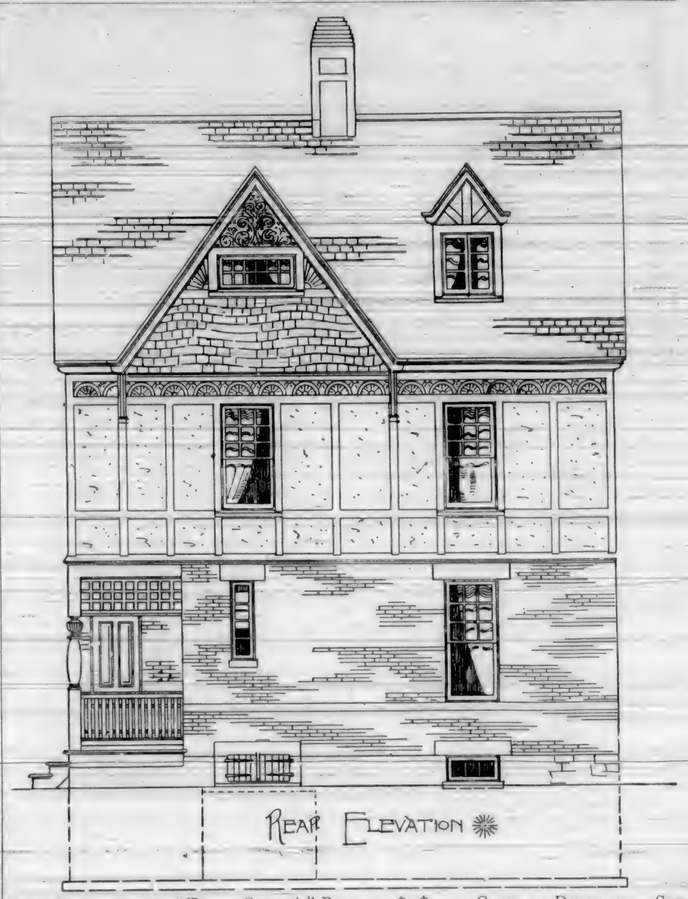
The Largest Room.

THE largest room in the world, under one roof and unbroken by pillars, is at St. Petersburg. It is 620 feet long by 150 in breadth. By daylight it is used for military displays, and a battalion can completely manœuver in it. Twenty thousand wax tapers are required to light it. The roof of this structure is a single arch of iron, and it exhibits remarkable engineering skill in the architect.

Building "Boom" in the United States.

SPECULATION in the United States has considerably diminished during the past twelve months, and the same remark applies to the construction of railroads. The chief feature now of domestic interest is the building "boom," which has spread throughout all the great cities. Yet, with the exception of Baltimore, the movement is not a speculative one. The great bulk of the buildings raised are in connection with the working classes, and many of them have been raised by workmen themselves. It is stated that in Boston, Chicago, Philadelphia, and nearly all the northern cities, there is a marked tendency towards the erection of small houses in the suburbs or outlying districts. In Chicago money is freely lent for building purposes at 5 per cent. In New York, Boston, Philadelphia, Chicago, St. Louis, Cincinnati, and New Orleans $114,000,000, have been invested in the erection of houses during the past year, representing about 18,090 houses, or an increase in the population of the above cities during the year of 130,000. The New York houses have been large and expensive buildings, flats, etc., as a workingman cannot there enjoy the luxury of a house of his own. But this is exceptional. The amount of building going on in New Orleans has been phenomenally large, much of this being due to the Exposition. There has been improvement generally in the number of dwellings, indicating an increase of population; and also a marked tendency in the direction of handsome dwellings, manifesting a good style in architecture.

La Semaine des Constructeurs gives an account of a competition, which recalls so strongly the history of many similar affairs here that we commend it to the attention of our less experienced readers. It seems that the town of Aubervilliers wanted a schoolhouse, or rather a group of school buildings, after the French fashion, to cost about eighty thousand dollars; and it was decided to obtain several plans, by the process of competition. A letter was therefore sent by the mayor to several architects, inviting each to furnish a design, and informing him that no payment would be made for the competitive plans, but that the author of one adopted would be employed to direct the work, and would receive the usual commission of five per cent. on the cost. Three architects accepted this invitation, and sent designs. Two weeks before the time set for receiving the plans an election was held, and a new mayor was chosen. This official, on being inducted into office, found the plans waiting for him, and, apparently desiring to emulate his predecessor before it was too late, engaged a local architect, named Pochet, to make a design for the building. M. Pochet seems not to have been much better versed in the science than in the etiquette of his profession, and his first attempt was so unsuccessful that he was directed to make another, which, two months after the other plans had been sent in, was placed with them as a competing design. Nothing in the way of municipal building can be carried on by local authority in France without Government sanction, and the mayor having been somewhat urgently addressed by two of the competitors, at last sent a request to the prefect of the Seine to have an expert appointed, who should report upon the merits of the four plans. The prefect appointed M. Trélat, one of the most distinguished among French architects, who, a few weeks later, presented a report, placing at the head of the list one of the designs first sent in, and advising its adoption by the town. Last in order he placed the project of M. Pochet, which he criticized sharply. The result of the judgment seems to have disappointed the mayor, who had certainly afforded M. Pochet every reasonable facility for winning success, and he delayed for two weeks to communicate with the town council. When this was at last assembled, a discussion took place with closed doors, and after one or two adjournments, it was announced that a vote had been passed to reject all the plans. The grounds for this decision have not been made public, but at the last accounts steps had been taken for inviting new competitive designs. Whether the architects of the neighborhood will offer any more, or what the town will do if no plans are received, remains to be seen.



REAR ELEVATION OF "TEASE QUARE'S" PLAN FOR A $5,500 COUNTRY DWELLING.—SEE "OUR ILLUSTRATIONS."

A German paper says that a roof can be made fire proof by covering it with a mixture of lime, salt and wood ashes, adding a little lampblack to give a dark color. This not only guards against fire, it is claimed, but also, in a measure, prevents decay. The materials are certainly inexpensive, and, it seems to us, reasonably efficacious.

New Books.

"ARCHITECTS' AND BUILDERS' POCKET BOOK." By Frank Eugene Kidder. Published by John Wiley & Sons, New York.

The principal aim of the author of this most certainly excellent work, is to give to architects and builders a *reference* book, which shall be to them a compendium of practical facts, rules, and tables, presented in a form as convenient for application as possible. The principal subjects that are treated in its columns relate to the strength and stability of foundations, walls, buttresses, piers, arches, posts, ties, beams, girders, trusses, floors, roofs, etc.; in addition to the above, is contained a great amount of condensed information and statistics and tables relating to carpentry, masonry, drainage, painting, plumbing, plastering, roofing, weights of materials, etc., etc. The whole is illustrated with over 400 original engravings.

A casual examination convinces us that the above is the best book yet presented to the classes it is designed to benefit. It was received too late for an extended notice in this issue.

"ARCHITECTS' AND STAIR BUILDERS' TABLES OF TREADS AND RISERS." By John A. Hamilton, architect. Published by W. T. Comstock.

A handy little work designed to save the time of busy men, and also for a text-book for the younger men, to whom the stairs are always a point needing strict attention to avoid mistakes. Price, 50 cents.

"STAIR-BUILDING MADE EASY." By F. T. Hodg-on. Price, $1.00.

This book contains a full and clear description of the art of building the bodies, carriages, and cases for all kinds of stairs and steps, together with illustrations showing the manner of laying out stairs, forming treads and risers, building cylinders, preparing strings, with instructions for making carriages for common, platform, dog-legged, and winding stairs. Numerous designs are also given for all kinds of newels, balusters, brackets, hand rails; etc., etc.

This work is principally designed for those who find it necessary to commence at the beginning and learn first how to build a stair of the humblest sort, until, by gradual acquirement, they are enabled to erect and complete stairs of a better description. The work is well written in the style peculiar to the author.

"ART AND SCIENCE OF STAIR-BUILDING." By R. T. Gould. Price, $1.00.

The object of the author of this work has been to reduce the art and science of stair-building to the shortest and most simple system of lines which will reach the end desired. The book contains thirty-six plates, descriptive of every portion of the work connected with stair-building. The author is well known, having written several other works in regard to the same subject.

"ARCHITECTURAL PERSPECTIVE," for beginners, containing eleven plates of practical examples, considered with reference to a student in an architect's office. By F. A. Wright, architect. Price, $3.50.

In preparing this work, the author has evidently kept in mind that large class of draughtsmen who are obliged to be self taught. Most of the works on the subject of perspective are either inadequate or too complex, if considered with reference to the actual needs of an architect's office. It is all very well to discuss vanishing points, visual rays, etc., but what the student in an office wants is the solution of the practical problems of making a perspective of a house. This book is of special assistance to draughtsmen who have but little time to give to perspective, and the start they may gain through its aid may be the means of causing them to study and learn more. The author has succeeded admirably in presenting his subject so that the student need not be confused.

Polishing Wood with Charcoal.

THIS method of polishing wood is described in a Paris journal. All the world now knows of those articles of furniture of a beautiful dead black color, with sharp, clear cut edges, and a smooth surface, the wood of which seems to have the density of ebony. Viewing them side by side with furniture rendered black by paint and varnish, the difference is so sensible that the considerable margin of price separating the two kinds explains itself. The operations are much longer and much more minute in this mode of charcoal polishing, which respects every detail of carving, while paint and varnish would clog up the holes, and widen the ridges. In the first process, they employ only carefully selected woods, of a close and compact grain; they cover them with a coat of camphor dissolved in water, and almost immediately afterward with another coat, composed chiefly of sulphate of iron and nutgall. The two compositions, in blending, penetrate the wood, and give it an indelible tinge, and at the same time render it impervious to the attacks of insects.

When these two coats are sufficiently dry, they rub the surface of the wood at first with a very hard brush of couch grass (chiendent), and then with charcoal of substances as light and friable as possible; because if a single hard grain remain in the charcoal, this alone would scratch the surface, which they wish, on the contrary, to render perfectly smooth, The flat parts are rubbed with natural stick charcoal; the indented portions and crevices, with charcoal powder. Alternately with the charcoal, the workman also rubs his piece of furniture with flannel soaked in linseed oil and the essence of turpentine. These pouncings, repeated several times, cause the charcoal powder and the oil to penetrate into the wood, giving the article of furniture a beautiful color, and also a perfect polish which has none of the flaws of ordinary varnish.

What Constitutes Good Mortar.

MACHINISTS and engineers often have occasion to use mortar, and will value the appended information: Good mortar is a solid silicate of lime, that is, the lime unites with the silica or sand to form a silicate of lime. In ancient days those who had some conception of the way the two things united superintended their mixing; but nowadays anybody is supposed to know how to make mortar, while nobody knows much about it. Dry lime and dry sand laid together or mixed and kept dry for a thousand years would not unite to form silicate of lime any more than acetic acid and carbonate of soda dry in a bottle would effervesce. To make silicate of lime just as good as was made by the Romans, all that is necessary is to proceed intelligently: Procure good caustic, *i. e.*, fresh-burned lime, and if you find it all powder, *i. e.*, air slaked, don't use it; use only clear lumps. Slake this (if possible in a covered vessel), using only enough water to cause the lime to form a powder. To this while hot add clean sand—not dirt and loam called sand, but sand—and with the sand add enough water to form a paste. Then let it lie where it will not become dry by evaporation, if in a cellar so much the better; for as soon as you have mixed the sand and lime as above, they begin to react one on the other, and if not stopped by being deprived of moisture will go on reacting until silicate of lime (as hard as any silicate of lime ever was) is formed.

But if you take this so-called mortar as soon as made, and lay bricks with it, unless the bricks are thoroughly wet, you stop the formation of silicate of lime, and might as well lay your bricks in mud. Lime and sand, after being mixed, might lie two years with advantage, and for certain uses, such as boiler setting, or where the whole structure of brick and mortar ought to be mixed for one year before use, and two would be better; but for house building, if the bricks are so wetted as not to rob the mortar of its moisture as soon as used, mortar that has been mixed a month will form good solid silicate of lime among the bricks it is laid with in ten years. The practice of mixing mortar in the streets and using it at once is as foolish as it is ignorant, and would be no improvement. Silicate of lime is made only by the slow action of caustic lime and sand, one on the other—under the influence of moisture. Dry, they never will unite, and mixing mortar as now mixed and using it at once, so as to dry it out and stop the formation that the mixing induced, is wrong.—*Sel.*

The fact that two adjoining proprietors verbally agreed upon, and for a long space of time mutually acquiesced in, a boundary line between their respective premises, will not prevent them, or their grantees, from subsequently disputing the correctness of the same, unless it further appears that at the time of such agreement the boundary line was doubtful, uncertain, or in dispute.

The Origin of Sewer Gas.

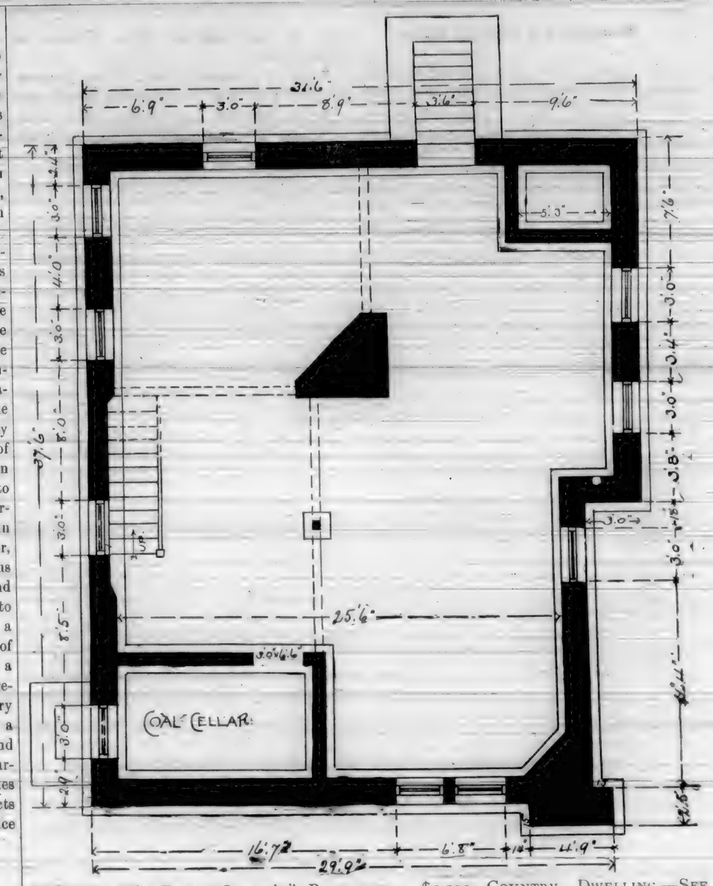
THE idea commonly obtains that sewer gas is a product of the decomposition of excrementatious matter, and that, therefore, the absence of a water-closet within doors disposes of the possibility of its admission to the dwelling. In consequence, the safeguards against its entrance, which are considered essential in the plumbing arrangements of a water-closet, are apt to be omitted in those which pertain to the bath-room or the kitchen sink.

This supposition rests, however, upon a two-fold error. In the first place, sewer gas is generated only in small quantity within house-pipes which are connected with a sewerage system. It is develop'd in far greater degree in the main sewer and returns along the course of every separate house-pipe which is unguarded by traps, water-seals and due ventilation. House plumbing arrangements, on the other hand, connected with a cess-pool, may become a conduit for the upward passage of sewer-gas of local origin. The introduction of excreta to the cess-pool is not necessary to its development therein. The amount of organic matter removed from the human skin and disposed of by means of the bath-water, is alone sufficient to originate the gaseous products of decomposition. The animal and vegetable substance which finds its way into the waste-water ordinarily deposited in a kitchen sink, is likewise a fruitful source of foul gases, which are competent to infect a dwelling-house unless properly excluded therefrom. It is essential, therefore, that every precaution be taken in the arrangement of a waste-pipe whencesoever it originates and wheresoever it goes. The householder is surrounded upon every side by invisible agencies of disease, and eternal vigilance, as respects these avenues of their approach, is the price of health.—*Cincinnati Building Review.*

The Results of Machinery.

NO CARPENTER in a city now thinks of lugging about a 300 pound chest of tools, consisting only of moulding, sash and match planes, as many in the country did in former years, in addition to the ordinary chest of tools which came into every-day use. Nowadays fine office and store fixtures, and much other work, come from the mill in such shape that a couple of ordinary clever workmen, with only a shoulder box full of tools between them, will put it up more rapidly than the thoroughly trained carpenters of old times after making the fixtures by hand. The proportionate number of good carpenters is decreasing from this, and the fact is that when a man finds himself good at any particular branch of the business, he follows it in preference to any other, and finds it more profitable to do so.—*The Carpenter.*

Article headed "Mantels and Grates" in our last issue, should have been credited to *Inland Architect and Builder*. A blunder not intentional on our part.



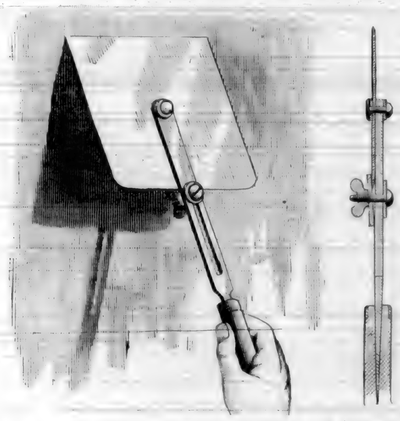
BASEMENT OF "TEASE QUARE'S" PLAN FOR A $5,500 COUNTRY DWELLING.—SEE "OUR ILLUSTRATIONS."

In no field of commerce is the rule of "cheap" prices, "cheap goods" so generally true as in the purchasing of building material; and because of this, property that should remain substantial and unimpaired for many years rapidly depreciates because the owner at the start sought to cheapen his building by giving a low price and expecting to obtain good work and good material. The owner has probably been educated to this by first buying his lot.

He finds that real estate in a certain neighborhood is of a certain supposed value, that value being the price paid in the more recent purchases, and if he succeeds in obtaining his ground for a less figure he has made a good bargain, and his ground is worth just as much as though he had paid a larger sum. He goes to his architect and tries to secure "cheap" professional services. Such can be had, but he has now entered a field where values are unchangeable. It is impossible to get good services cheap, but he does not know it, or willfully closes his eyes to the fact, and the result is the business man who would not dream of submitting an important law case to a "cheap" lawyer, or trusting himself in the hands of a "cheap" physician, will consider the less he pays his architect the better off he is. He insists upon "cheap" contracts, and perhaps the contractors, after figuring upon the lowest "living" basis, are requested to re-figure, and the result is a lot of contracts let for less than cost, and a building that is "skimped" in every place it is possible, and in the end the owner receives a building that in a few years will be practically worthless. It seems to us that architects can do much to regulate all this by educating the building public. They should deal with none but reliable contractors, and feel perfectly free to give a contract to the most capable builder, instead of the lowest bidder, where the circumstances warrant it. This is a professional question that should receive the early attention of architects.—*Inland Architect.*

Whitening and Scraping Walls.

THE modern mode of whitening or kalsomining hard finished walls is such that in frequent repetitions of the work, with various inequalities in the mixtures, it soon becomes surcharged. This is one of the causes of scaling, bunching in sponge-like masses, leaving the work uneven and unsatisfactory. Plastering, when thus loaded, should be at once removed by sponging or scraping, leaving it, when so done, clean and ready for a renewal of the whitening process. Many whiteners, instead of removing the superfluous mass, resort to subterfuge, and besmear the walls with vile mixtures to tide over to a more convenient season, or leaving the blotched, overcharged walls for the *next*, to whom it may concern to rectify. The one apology frequently made for this neglect of the work is inadequate compensation, that the price of work is so reduced that it don't pay. This latter remark is too true in this case, for it does pay to finish up a job in a workmanlike manner. It is true the prices have declined, but no more so than in other mechanical lines, and yet good work still pays the hard-working whitener. There is great complaint made of the laborious work to scrape and cleanse whitened walls, and the principal reason is that too many of them employ poor tools to do this work, and therefore it is more arduous. To render this part of the work less irksome, a new patented scraper has been introduced which will lessen the labor by its mechanical adaptation to this class of work. I refer to the Patent Reversible Scraper just come into use; by it the workman has in hand a good sharp tool, four sided, having two sharp and two square edges, with one of them rounded on the corners. With this tool he can do more work, and can do that work better with less expenditure of labor. One of the advantages of this reversible scraper is that when one side is dulled it can be turned and another side can be brought forward to push on the work. Good tools are compensating, and those who use them will feel proud that such an implement has been invented to lighten labor.



When the plastering has been properly scraped or washed, the exposed defects are mended, and then rewhitening them with good materials the plastering will come out bright and clear like new walls. Work done in this style will command a better price, and will ensure the mechanic with many walls for his superior work. J. E. W. C.

One day a Parisian, whose wits constituted his sole capital, saw an eligible plot of building land at the corner of two streets, and reflected that the man who built a house there would be a lucky fellow. Some twenty yards further away he noticed another eligible plot of building land covered with building materials. On inquiry he discovered that the corner plot belonged to a Breton nobleman, who had had losses on the Bourse, and was living economically in Bretagne to recuperate. The plot with the building materials on it had belonged to a celebrated doctor who died a couple of years ago, and about whose will an action has been pending for the last eighteen months before the courts of Auvergne. Our swindler, sure of not being disturbed for some time, at once went to a young architect, and got him to make the plans for a fine mansion at the corner. After having approved of the plans, he authorized the architect to make an agreement with a contractor and to use the materials on the other plot, which he said was also his. The work went merrily on, and the sharper brought a few old ladies, to whom he had sold shares in gold and silver mines in improbable regions, to admire it. At the sight of such splendid security they did not hesitate to advance him all the funds he asked for. Everything has an end here below.

One day the Breton nobleman came to Paris and went to look at the land that want of means compelled him to leave unproductive. He was of course delighted at the agreeable surprise that met his gaze, and inquired of the builder who was the unknown benefactor to whom he owed it. The builder referred him to the architect, who referred him to the pseudo-owner, but the latter had not been home for many days. He was, in fact, in Mazas Prison on account of some imprudent act he had committed in the neighborhood of the Bank of France. His affair, as the French say, was clear; nor did he attempt to deny it. Only during his trial he was seized with a fit of irrepressible laughter. On the Judge reprimanding him, and asking him what he saw in the matter to make him laugh, he apologized, and said that he could not help laughing when he thought of the intricate maze of actions-at-law his building freak would cause. The series is indeed a long one, and has already begun. The contractor sues the architect, the architect the Breton nobleman, who maintains that whatever is on and under his land belongs to him; the Auvergnate heirs also sue the Breton for the materials, and the old ladies sue everybody else, pleading that the land, building, and the materials belong to them as security for the money advanced. Such is the substance of a story told by the Parisian correspondent of the *Manchester Evening News*.

Carrying Coals to Newcastle.

THE following remarks taken from one of our leading mechanical journals, aptly illustrate the folly of sending East for material, a better duplicate of which can be found on this coast.

"The famous Flood mansion, in San Francisco, is being finished, in part, at least, with cut brown-stone The stone is all cut, dressed and marked in the quarry in Connecticut, and when reaching the structure is placed in position at once as originally calculated, without redressing or fitting. A San Francisco paper a short time since mentioned the arrival of a ship, 150 days from New York, with 350 packages of cut brown-stone for this building. This would seem very much like carrying building material around the globe, or at least a distance nearly equal to the circuit. Such a shipment, it is hardly necessary to remark, is somewhat unusual."

A foreign contemporary says: "Nothing adds so much to the cost of building as indulgence in whims. To set out deliberately to do a 'queer,' 'fanciful,' or, as it is sometimes called, 'original' thing in building is always to incur unnecessary expense. If we look through the books that contain pictures of the architecture of all ages and nations, we shall find that, without an exception, in the times all men of taste are agreed in calling the good times, the modes of building have been sensible, founded on the needs of the case, and that whatever may seem fanciful—the whole of what we call picturesque—when its charm has proved enduring, is the result of what we may call, in every case, 'accepting the situation.' Nothing has been done in such instances for the sake of being picturesque. Good building, good ornament never poses. In building, as a rule, every departure from the rectangular form is an added expense. One of the things impressed on the mind of a young man who goes into an architect's office to study the profession is, that if cost is to be considered, which it sometimes is, and sometimes is not, all excrescences and projections must be avoided. A rectangular house is the cheapest. Bay windows, porches, octagonal or circular, external ends to rooms—all these things cost money, and it is by multiplying these features that the expenses of building are often made so great as to deter people from undertaking it, for the things seem so small in themselves, it is not suspected what drains they are on the purse. If a good reason cannot be given for any so-called ornamental feature in a house, if it cannot be shown that something worth while is to be gained by making it, we may be reasonably sure that it is a fancy which will cost, as the country people say, more than it comes to. And in the greater number of cases, nothing, even in looks, is gained by indulging the fancy."

The Way Out.

EXPERIENCE keeps a dear school, not altogether because her rates of tuition are so high, but because her pupils, meaning average and aggregate humanity, stubbornly refuse to learn and remember disagreeable and uninteresting lessons. She has taught us over and over again, charging a tremendous price for the instruction, that it is dangerous and wicked to entice a great number of people into a large hall or church by the promise of amusement, instruction, entertainment or salvation, and then, when the curtain falls and the lights are turned off, dismissing them suddenly and all at once, leaving them to find their way out as best they may. We have found that, even with no more powerful incentive to haste than the wholesome desire to get into the fresh outer air as soon as the performance is concluded, there is great discomfort attending the exit and not a little danger to those who are feeble of breath or limb; yet we go on building public halls with most sublime disregard of these familiar facts, apparently oblivious of former experience and of the warnings that are constantly occurring. For a short time after the periodical theater panic, or the crematory exercises, there is a popular interest in the subject which goes so far as to cause a few extra cautious people to forego for a season the prospect of an evening's amusement rather than suffer the anxiety attendant upon entering the tempting trap, and a few others to give only half their attention to the entertainment, the other half being on the alert for signals of calamity. In a few weeks, or months at most, even these cautionary symptoms disappear and the crowd pours in without a thought of the facilities for getting out.

We visited recently a model public hall. The exterior of the building bears conspicuous, unmistakable evidence of the rare skill and artistic ability of the designer. It is the embodiment of originality, dignity and grace. There was evidently an ample appropriation for carrying out the architect's conception, and certainly there were no restrictions as to space; there are acres of land to spare. The main hall will hold comfortably six or eight hundred people, possibly a crowd of a thousand. It is in the second story of the building, perhaps sixteen or twenty feet from the ground. The way into it—but that is of no consequence, people go in slowly by twos and threes, singly or in small squads; the way *out* of it, which is, of course, the same thing, is through a single stairway that winds down inside a small octagon tower in one corner of the building, a stairway barely wide enough for two level-headed and average-sized people to go down abreast; three would choke it. This is one of the most recent and beautiful of public buildings.

In another New England town we recall a huge, pretentious block, the third story of which is occupied by a large hall fitted for lectures, musical and dramatic entertainments. The hall has a gallery, but the main floor is

DESIGN FOR RUSTIC COUNTRY DWELLING.

thirty feet from the ground, that is, up two long flights of stairs, one long and straight, without rest or landing from top to bottom, the other doubled and twisted into three or four short runs. These stairs also occupy a tower at one corner of the building, a tower which, as regards height, would have been a fair beginning for the tower of Babel. There are four double doors five or six feet wide that open from the main hall into short corridors leading to the top of the stairs, one of these corridors being just three feet wide at the point nearest its outlet, and where it receives the stream from the gallery. The other corridor is somewhat wider, but is diversified by a post nearly two feet square standing about twice its diameter from the brink of the main descent. This is the only large hall in the town in which it stands, a town noted for the wealth, intelligence and public spirit of its inhabitants. This is not, however, owned by the public, though built for public use. It is "modern," and is reckoned one of the local "ornaments."

Once more, a city hall that holds three thousand people and is often filled to its utmost capacity; the way into that monstrous hall is up a winding stair, or rather two stairs, for it has two flights that are familiar to the enlightened public, and they wind to that degree that, in coming out, the entire audience must wheel by platoons - very small platoons—six times in descending the first twenty feet or thereabouts. Those who happen to be next the turning post on the way down, usually emerge—if they emerge at all—sadder and thinner than they went in. This evolutionary descent of the three thousand doesn't bring them to the street level. There is an outside flight of stone steps not unlike a section from the rugged slope of one of the great pyramids. It is a toilsome way, either up or down, and the gross labor performed by a full sized audience at each lecture or concert would take a congregation of respectable size—four or five hundred—to the top of Bunker Hill monument. But the American public is patient and long-suffering to the last degree in matters of personal ease and safety. We do not know that there has ever been a fatal accident in either of these buildings that can be attributed to their tedious and dangerous approaches. Perhaps there never will be. They are not mentioned as conspicuously dangerous examples, but are taken at random and are probably above the average as regards safety and convenience of access and exit. – *The Builder*.

A case has just been reported at Glasgow which shows convincingly enough how disease is spread and how danger may beset us, no matter what precautionary measures we may take. Time was when the careful wife had the family linen washed and got up under her own immediate supervision, and when drying-places abounded within reach. But we have changed all that. The drying-places have in the main disappeared, and the wife of even a very small clerk has become too genteel to have the washing done at home. We now give it all out, at some expense, it is true, but with less trouble to ourselves. And so the laundry has been called into existence, and laundries of every kind have been made profitable by the gentility of the masses, combined with the disappearance of open spaces. But there is no pleasure without pain. Our gentility is purchased at a great risk, for careful and cleanly as we may be, we are under the "genteel" system put on an equality of risk with perhaps hundreds of families who are not over careful and cleanly. This has been illustrated in the Glasgow case referred to. A woman sent infected articles to a laundry, but before much mischief was done the iniquity of the proceeding smote her conscience, and she confessed her wrong-doing. But how many are equally guilty, and how few repentant sinners are found amongst them! The risks we daily run outside our own personal supervison are indeed great – but then we are nothing if not genteel!

There is not so much risk in buying lumber now as there is in selling it to men who will pay for it when they get a good ready.

Modern House Painting.

In the early history of this country, houses were built with a view to the comfort and convenience of their owners, regardless of the appearance of their exteriors and of the most simple forms of interior arrangement, the prime object, and in most cases the sole object, being shelter; the usual form being box-like in shape, with right angle partitions running across from side to side, and from front to rear, forming rooms of the same general shape as the outside walls; entrance by the front doors, placed one in a long narrow hall, barely wide enough to admit of passage between the long, straight stairway and the wall separating the hall from the parlor. The size, shape and general nature of such an apartment—usually very dimly lighted—permitted of little in the way of decoration, either with pictures, hangings or furniture. Even at the present a large proportion of semi-modern houses are constructed with similar entrances, bare and cheerless, and which, rather than being considered as part of the habitation, are looked upon as mere passage ways to the living apartments. Of late years, however, a great change has been made in the character of home entrances. In modern houses we find a grateful absence of the tunnel-like hallways, and in their stead find ourselves ushered into cosy reception rooms, pleasantly lighted and heated by open fires and arranged in form to admit of ornament and decoration. The stairway, that is the sole occupant of the old style hallway, finds itself tucked away in a convenient place, where, with ornamental woodwork, tasteful trimmings and modified shape, it plays an important part in the adornment of what is no longer a hallway but an apartment. During the last eight or ten years great improvement has been made in the architecture of homes, and what has been given us in the line of improvements by those who make a study of the planning and construction of houses, has led people into studying the work of others in forming plans for their own homes. The effect of good ideas and improved methods of building is particularly noticeable in the numerous alterations and modifications of old houses, by which they are made to conform to modern tastes. People who contemplate building make a business of studying good examples and of educating themselves in matters of convenience and beauty as applied to the building and decoration of homes; thus an interest is awakened, new and unthought of ideas are put into shape, the fixed peculiarities and hobbies, of which all have more or less, are eliminated or toned down and modified by comparisons with the study of others (commonly the refreshing study, if entered into for the purpose of learning), which leads to the outlining of plans that go to the architect in so comprehensive a shape as to require little modification, and the owner finds his study quite to his taste, with the stamp of more or less individuality, as was expected and intended; while the fact that the owners are, to an extent, the creators of the structure lends an added charm to its beauty and the enjoyment of it. The prevailing style of building is of the Swiss cottage, Queen Anne or Colonial order of architecture, all of which offer a wide range of forms and permit of an endless variety of both exterior and interior decoration. In this order of construction there is an endless field of study for the painter and decorator, for, while any scheme in which harmonies are preserved will look well upon them, there are within the lines of harmonies such a multitude of schemes and combinations that a keen sense of fitness and no little artistic taste is necessary to determine which among the many possible schemes is best adapted to each particular subject. In fact, although good examples of modern artistic painting are numerous, there are few, if any, that are beyond criticism. Mistakes are not of infrequent occurrence, many of which are distinctly attributable to bad judgment in balancing. Take, for instance, an example in our mind of a first story in Venetian red, with a second story in an olive, with dark olive brown trimmings. The writer has seen this combination, and though decidedly bad, it is no worse than numerous others met with upon houses that offer superior advantages for good and effective coloring. In the example referred to, the colors are all good for the purpose, but the scheme, although well divided, is thrown wholly out of balance by the disposition of the colors. The red being lightest is made to support a heavier color, the effect of which is a dwarfed and flat appearance. The same colors transposed, will, with a little assistance, form a pleasing and correct combination if handled as follows:—

The dark olive brown of the trimmings should be made the body of first story, leave the olive on the second story, and use the red for trimmings, with the addition of a little yellow and a small quantity of blue. The use of the dark color for the lower body gives the idea of strength and support. The lighter color above seems to lift and brighten up the structure, while the warm colors of the whole trimming complete the harmonious combination. This combination will answer very well on a plain, ordinary house, but where the house is furnished with a number of bay windows, gables, porches and balconies, and an artistic effect is desired, it will require a special treatment with several more colors and shades of color.

Cottage houses, of which there are a great many being built at present, are of great benefit to the exterior decorator. These houses, being built of greater variety than other styles, allow of more varied styles of painting and a greater number of combinations of color. Many of these houses are built with the upper story projecting over the lower, and with numerous gables, bay windows, balconies, etc. When it is desirable to paint one of these houses with one color only, it is well to make at least four shades of it, the darker shade for the first or ground story, the next shade lighter for the second story, the next for all gables which are separated from the second story by ornamental bands, balconies or anything making a complete separation; body of all bay windows and all projections from the main building, the lightest shade to be used for trimmings. A very good combination for this style of house, if the second story is built with shingles, is to paint the first story and all of the trimmings a dark olive green, the gables a good citrine color, or what painters generally call yellow olive; for the shingle-work of second story use a red stain for the purpose of giving it the appearance of being covered with tiles; treat the roof in the same manner. Painters have found it quite difficult to make shingles retain the color produced by the stain. This trouble can be avoided to a considerable extent by the use of wax after the stain has become dry and before the shingles begin to turn dark. For a simple combination this is as good as any for this style of house, but where it is desirable to make more display of colors use three colors beside the stain for shingles.

In the original colonial style of houses the first story was built of either brick or stone, the second story and roof of tiles, and all the windows, doors and outside woodwork left the natural color, without paint; but the colonial order of houses of the present are built of other material, and it being desirable to keep them always fresh and new looking, it becomes necessary to use paint. The modernized colonial house is built with first story of either brick or stone, the balance of the house being wood.

In painting the woodwork, paint the body of the second story and roof with a red color in imitation of tiles; paint the balance of the woodwork, such as cornices, doors, windows, balconies and what other woodwork there may be, a light oak color. Where it is desirable to give more variety to the structure, use an olive green color on blinds, doors and around all ornamental work inside of frames, such as carving in gables, panels, etc. The frame should be in oak color.—*Painter.*

We wish no ill to the carpenter trade, but is not the storm-door and weather-strip business carried too far nowadays? In nine cases in ten the people in apartments protected by them are worse instead of the better on account of them. Few houses are properly ventilated. A great number have no provision whatever for ventilation. All the fresh, pure air the inmates get comes in through doors and windows. When windows are "caulked" or protected with weather-strips, and storm-doors shut out air, where is an adequate amount of pure air to keep the inmates in perfect health to find entrance? There are, doubtless, conditions in some houses which make storm-doors desirable for protection to health, but in general the more pure air people get the better. The most of them do not get enough.—*American Artisan.*

About Screws.

The screw is not, says a writer in the *Sewing Machine News*, of modern origin, although it was not known to the ancient Egyptians. The helix of the Greeks was the first thing known to be made in the form of a spiral, and was by them used in moving large, heavy bodies, and must have been constructed similarly to our jack screws. It was invented by Archimedes, at Syracuse, about 250 years before the Christian era. He also used a similar device for the purpose of raising water. (This last invention has been used by the Egyptians since the Christian era.) History gives us no account of how Archimedes formed his spirals.

Another inventor and philosopher, who lived in the fourth century, tells how he made screws.

He used a template in the form of a right angle triangle made from thin brass, which he wound around a cylinder, the edge of which he used as a guide to form the threads, after which the brass was removed. Of course this could not be done on very fine screws.

Besson, a Frenchman, in 1569, invented a lathe for cutting screws by the aid of a guide screw; and Hindly, an Englishman, improved it for use in watch making in 1740.

Ramsden, in 1776, invented a machine called a dividing engine, with which he made screws of a good quality.

Mandslay paid great attention to the manufacture of screws and invented several machines for the purpose—but finally settled down to the stationary knife, or cutter, and revolving rod. The rod revolved as in our modern lathes, and the cutting tool was fastened to a sliding plate, which was moved by a guide screw. This screw was made to revolve by belts and pulleys similar to some old lathes now in use. By changing the pulleys a different speed was given to the guide screw and the screw was cut finer or coarser as might be required.

From this sprung the gears now in use. Mandslay at first made the guide screws of different sizes and changed them instead of the pulleys, but this did not prove a success, as screws could be cut only the same thread as the guide screw used.

To Mandslay more than any one else is Holtzapffel indebted for points in his lathe, which was in its day the best in use, and is still very much used. Holtzapffel wrote a treatise on the lathe in three volumes, which is still an authority. His lathe is used not only for the purpose of cutting screws, but for all kinds of fancy turning. There is or was, not long since, one of them in this city.

The finest screw thread used in watches is 250 to the inch. These are made by automatic machines, and without the aid of a magnifying glass no thread can be seen at all. It takes over a hundred thousand of these to weigh a pound.

We cannot recount the thousands of different uses to which screws are put, but it may be of interest to know that the watch which you carry in your pocket, if it has a compensating balance, has 44 screws, 22 of which are in the balance wheel; and if you have one of the best watches these 22 screws are made of gold.

In the modern screw machine, different sizes of dyes are used. Knight, in his Mechanical Dictionary, describes them as being stocked in a circular head and such a one is selected, and presented to the plank as may be of the size desired. It has also a rest with a transversely sliding tool post whereby the screw may be cut off or dressed.

Automatic screw machines are now in use in all large factories. A company in Hartford, Conn., holds the principal patents on this kind of machinery.

There are various kinds of stocks and dies used for cutting screws, but as they are only used for special purposes or on a small scale, they require no particular mention. Their origin is unknown.

A Thief Killed By Electricity.

On a recent feast day at Cotopaxi, Mexico, the leader of a band of thieves in that section concocted a scheme for a large haul of plunder by extinguishing the electric light in the cathedral. He used a small wire, which in his ignorance he threw over the exposed wires of the electric light, and the current passing through his body killed him instantly. His confederates were appalled at the sudden death of their leader and fled, escaping capture.

Tenants May Vacate Unsanitary Houses.

A case has recently been decided in New York, justifying the right of a tenant to vacate a house and refuse to pay rent on the ground of unsanitary conditions. The case was: "In a suit for rent claimed to be due from a tenant of a suite of rooms in an apartment house, it appeared that the tenant's wife and servants were taken sick by inhaling a malarial or poisonous gas in the apartments occupied by them; that this unhealthy condition of the apartments was owing to a defective condition of the general plumbing work of the house, of which the landlord was notified by orders from the Board of Health, requiring him to have changes made in the plumbing work, and which unhealthy condition could have been removed if he had complied with these orders; that the defendant waited for two weeks, and finding that nothing was done on the part of the landlord, left under the apprehension that he was imperiling the health of himself and family by remaining." The case was appealed to a higher court and confirmed. It is to be hoped the practice will become general.

Whenever one person does work or service for another with his consent, and there is no agreement as to compensation, the law implies a contract to pay what the same is reasonably worth; but when the circumstances of the case clearly repel the idea that the work or services were done with the expectation of payment being either made or received, no such contract will be implied.

French Walnut.

The finest and most costly of the veneer woods is French walnut—a wood that does not come from France, but from Persia and Asia Minor. The tree is crooked and dwarfed, and is solely valuable for the burls that can be obtained from it. These are large, tough excrescences growing upon the trunk. In these the grain is twisted into the most singular and complicated figures. The intricacy of these figures, combined with their symmetry, is one of the elements that determine the values of the burl. Color and soundness are other elements of value, which vary very widely. Burls worth from $500 to $1,000 are not rare, and at the Paris Exposition for 1878, one burl weighing 2,200 pounds was sold for $5,000, or upwards of $2.00 a pound.

Windows are no longer placed in regular rows, with a mathematical precision, to which convenience and beauty must be sacrificed. The need or fancy of the builder of a new house is a sufficient excuse now for a window, and greater variety in size and shape than ever is shown in the house recently built. Square, rectangular, circular, and quarter-circle windows may be run on one house front; fashion having, happily, joined hands with convenience and fitness in this matter. Stained glass, in every variety of color and combination, is coming into general use. First-floor windows are usually large, but are so divided by sashes that the glaring effect of a great unbroken sheet of plate glass is avoided. Circular and arched tops are in high favor, the curved upper sashes being filled with colored glass. A favorite window of this description has a large, clear central sash with a transom and narrow side sashes, which are filled with jeweled mosaic glass. Beside the usual curtain, the lower half of the narrow side division has often a full sash curtain of Madras lace or silk gauze. The stained-glass work offers opportunities for admirable color effects. Floral and geometrical forms are better than any attempt at picture work, and mosaic effects are far more satisfactory than painting. Turquoise blue is very successfully used in contrast and combination with stronger colorings, and a window with side sashes filled with olive glass, shading from the deeper tones at the bottom up to a pale greenish amber, is very satisfactory. Where economy is necessary, a border of small panes of clear colored glass around the large middle sash is inexpensive and good in effect if the colors are well chosen and arranged.—*The Builder and Wood-Worker.*

At $15 per thousand mill run, 1,000,000 feet of lumber is worth $15,000; at $12 it takes 1,250,000 feet to bring that sum. Is it better for the manufacturers to so conduct their business that they will get the higher price, and leave the 250,000 feet in the tree, or crowd the markets and get the minimum price? Every manufacturer ought to quickly answer such a question.—*Northwestern Lumberman.*

Shingle Roofs.

THE form of roof known as a shingle roof is of the greatest antiquity. When it originated or by whom invented history fails to tell us. It is probably one of those things of natural growth which never had a definite beginning, but came up by gradual steps of improvement from a very primitive form to its present shape. Reasoning by analogy, it may have originated in an attempt to imitate the feathers of birds, which shed water in a most remarkable manner. Its prototype is also found in the arrangement of leaves on certain trees. It may have been preceded by the thatch and some forms of bark roofs, and those have come into use as an improvement on a still more primitive type. Shingle roofs may be described as pioneers in roof construction. When timber is abundant, a shingle roof is one of the cheapest that can be constructed. Its lack of durability in a comparative sense, and its frequent destruction by fire, make it less desirable than other materials; accordingly, as lumber becomes scarce, as house owners become wealthier, and as buildings improve in character, shingle roofs give way before material better adapted to stand the test of time employed in the newer sections of the country than in the older, and the use of shingles upon roofs is to a certain extent an indication of the class of buildings that are being erected. As pine timber becomes scarcer, and as prices for shingles gradually advance, their use is likely to be more and more restricted until it is possible that in this country, as in England, the time may come when their employment will be the exception. A shingle may be described as a flat, wedge-shaped piece of timber of varying dimensions. Shingles are made in length from 12 inches as a minimum up to 24 inches, and in a few cases still larger. In width they vary from 3 inches, which is about the smallest that can be used advantageously, up to the widest possible that can be readily obtained from the tree out of which they are cut. The thickness at the butt varies from $\frac{3}{8}$ inch to nearly $\frac{3}{4}$ inch with the different lengths. The points are from 1-16 inch to $\frac{1}{8}$ inch in thickness. The most common sizes employed are 16 and 18 inch. In some portions of the Eastern States 18 inch is the standard, while in the vicinity of Chicago and throughout the West 16 inch is the standard. In a commercial sense, a shingle is a piece 4 inches wide, and in speaking of 1,000 shingles we mean the equivalent of 1,000 pieces of whatever length, 4 inches wide.—*Carpentry.*

Fading of Water Colors.

THERE is a great deal of nonsense written and uttered about the fading of water-colors when hung in the sunlight. Experience has shown that they will not fade at all if they are under glass. If you lay a water-color under the direct rays of the sun, without any protection, it will fade. So will anything with color in it, except an oil picture. But no pictures are hung in the direct rays of the sun. The oblique rays, striking the glass, are harmless. As a matter of fact, a water-color properly mounted and tightly framed is less subject to changes than a picture in oil, whose surface is exposed to atmospheric influences and to dust and smoke, and whose back is bare to the influence of the moisture of the wall against which it hangs—an influence which is often quite pernicious.—*Art Amateur.*

The Form of Chimneys.

THE question is often asked which shape of chimney of equal dimensions has the best draught, the round or square form. Other things being equal the round will furnish the best. The principal object in erecting a chimney or stack is to place the apex sufficiently high above the surrounding objects to secure a natural current of air. With a square surface this is obstructed to a limited exent Furthermore, the best atmosphere in its ascent meets with more obstruction for making that circular upward motion so essential to good draught. But with the round exterior this motion is not obstructed, but is rather accelerated, and when the top is reached the hot air within is carried off with much greater rapidity than with the square exterior, hence, of two chimneys, one round and the other square, of equal dimensions in every respect, the former will be found to draw much better. Again, though it cost more to build the round one it is cheaper in the end, inasmuch as they resist the action of the wind less, and are not so liable to damage by cyclones or high winds. To be sure the round chimney is not quite so easy to arrange the flues after being built, but it must be borne in mind that one great drawback to many stacks is too many flues. It is much better to have one principal flue and connect the others with *this* than to make so many holes in the *main stack*, every hole making less draught.

The Dibble Manufacturing Co., of Trenton, N. J., have recently added four large hydraulic presses to their plant, with full outfit of fitting and finishing machinery to match. Their hemacite knobs are being used in steadily increasing quantity and are steadily increasing in favor. They are easily the best door handle for all interior doors, strong, handsome, durable, and pleasant to the hand, and moderate in cost. Never have they put out such well made and handsomely finished goods as now. Their processes have been greatly improved by the last six years' experience. Their works have run steadily day and night for the last three years. Many architects and their clients have asked them to make a plain, smooth finish hemacite knob, and such a knob they will presently offer, of handsome gothic shape, bronze mount, and head not distinguishable from finely finished ebony.

Write for illustrated list (free) to the company, or to Gordon Hardware Co., San Francisco, Los Angeles, Cal., or Seattle, W. T.

Unburnt Brick.

MUCH as many may dispute the fact, it is nevertheless true that unburnt brick form a much drier wall than burnt brick, inasmuch as they are not so absorbent of wet or damp. To make these, any ordinary clay will answer. If dry when obtained, it must be first moistened and thoroughly worked by the feet of cattle, or pounded by hand. Cut some straw into pieces about six inches in length; after being duly mixed with the straw the clay is ready to be made into bricks. A mould of any size may be made; this mould should have a bottom, but not air-tight, in order to prevent the brick from sticking in the mould. The clay is put into this mould and the brick formed much in the same way as ordinary brick. Should the clay be very tenacious, a little sand sprinkled into the mould will enable the brick to leave it freely. The bricks are placed on level ground to dry, turning them on their edges on the second day; thereafter left in piles, protected from the rain, for ten or twelve days. —*The Clay Worker.*

Sewing Machines and Slates.

SOME time since an Eastern sewing machine company received an inquiry from a Western house as to whether they could make a machine to sew through wood. The result of this correspondence was the sale to the parties of six or eight wax thread machines to be used solely in binding the edges of slates, such as are commonly used in school. Worsted binding is first passed to the edges of the frame, and then stitched on with the leather sewing machine. The object is to save the noise which naturally results from fifty or more slate frames clattering on the school desks at once. —*Sewing Machine Journal.*

How to Determine the Number of Wood Screws.

MANY times people have been at a loss to determine the number of a screw which they want for a certain piece of work, although they know the exact size by measure. Perhaps the following rule is not *exactly* correct, but it will be found near enough for most practical work: One-fourth inch in diameter is No. 15, and each 1-16 of an inch either way is five numbers; consequently, a screw measuring 5-16 would be No. 20, and 3-16 would be No. 10, and all other sizes in the same proportion. E. H. DAVIES.

Moulding Sand.

A LARGE proportion of the moulding sand consumed in the foundries of the United States is dug out of the hills of Albany County, N. Y. It is said that everything in fusible metal, from a Krupp gun to a heel plate for a lady's shoe, has been cast in Albany sand. Quantities of it have been exported as ballast. The annual shipment of sand (obtained thereabouts) from Albany is estimated at 75,000 to 100,000 tons, the price paid for it, delivered on board the cars or boats, being about $1.25 per ton.—*The Manufacturer and Builder.*

Our Exchanges.

WE have made arrangements with the Editors of the following Journals, by which we are enabled to offer quite a reduction to those subscribing for any one of them in connection with this Journal.

(The figures in parenthesis denote the price of the journals alone.)

CALIFORNIA ARCHITECT AND BUILDING NEWS
Terms, $2.00 per annum.

With *American Architect* ($6.00), $7.00 per annum.
With *Builder and Wood Worker* ($1.00), $2.50 per annum.
With *Inland Architect and Builder* ($1.75), $3.25 per annum.
With *American Artisan* ($1.00), $2.50 per annum.
With *Building* ($1.00), $2.50 per annum.
With *Northwestern Lumberman* ($4.00), $5.00 per annum.
With *Scientific American* ($3.20), $4.50 per annum.
With *Leffels' Mechanical News* ($1.00), $2.50 per annum.
With *Decorator and Furnisher* ($4.00), $5.00 per annum.
With *American Machinist* ($2.50), $4.00 per annum.
With *The Wood Worker* ($1.00), $2.50 per annum.
With *The Builder* ($2.00), $3.50 per annum.
With *Hall's Journal of Health* ($1.00), $2.50 per annum.
With *Cincinnati Building Review* ($1.00). $2.50 per annum.

We will add to the above list from time to time, as our arrangements are perfected with the publishers. We are prepared to furnish any journal printed at the shortest possible notice.

The habit of "swearing off" at the beginning of the year is a time-honored one. The retail dealer should "swear" that he will look close to his credit; that he will keep his stock well assorted; that he will keep his yard in good order. The manufacturer should "swear" that he will go slow all along the line—in the woods, and in the mill; that he will keep well insured; that he will bear in mind every day that pine stumpage is not so plentiful in the Northwest that it should be disposed of for a song. The wholesale dealer is between two fires; he must do the best he can, therefore it will not avail him much if he swear at all. —*Northwestern Lumberman.*

SPECIAL OFFER.

BOUND VOLUMES OF THIS JOURNAL

TO NEW SUBSCRIBERS FOR 1885.

Upon receipt of $3.25 we will send a bound volume of this Journal of either 1880, 1881, or 1882 and the full year's numbers of 1885.

We have had an extra number bound of the years mentioned, and make this offer to increase our subscription list. We are bound to increase our list, so that the end of the year 1885 will witness not less than

TEN THOUSAND

Paying subscribers on our books.

Office hours are more necessary to be observed than almost any other rule among architects. The architect who, perhaps, has a partner or a capable head clerk can be indifferent to the hours when he may be found in his office, but he who has a small practice and no efficient man to take his place, while absent, should have stated hours when he is sure to be "at home" to the calls of clients and contractors. "It is rather discouraging," as a discomfited would-be client remarked of a well known architect the other day, "to call on an architect and find him 'out,' and have a young draughtsman peer from the obscurity of a high collar and a draughting board and say, 'Don't know' to an inquiry regarding the time when his principal can be seen." An architect must be popular, indeed, who will be likely to have a client call many times with such discouraging results.—*Inland Architect.*

The art of pottery in China is be as old as 2500 B.C. In Japan, hard porcelain dates from 27 B. C.; translucent porcelain was made about 672 A. D.; but between 1211 and 1221, Ko'osiro, a Japanese potter, went to China to improve his process. There are eighteen celebrated potteries in Japan; and in modern times, the pieces exported come chiefly from Imalia, in the province of Hizen. In 1644 the Dutch exported 44,943 pieces from Japan. At the beginning of the sixteenth century the porcelain of China began to be extensively imported into Europe, and various unsuccessful attempts were made to discover the secret of its manufacture, but without success, both as to the material and the process. The Persians indeed, are said to have produced translucent pottery about the fifteenth century A. D.

So there are no hod carriers in Germany, for the simple reason that a hod is as unknown there as an Irishman is, each brick must pass from hand to hand again. The higher up the brick layers are the more men are required to toss the bricks. Two men to a story is about the average, with enough more to lead from the front of the building to the place where the bricks are needed. One may sometimes see three men on the ground, eight on the front of the building, and five on the top, making sixteen men through whose hands each brick passed before it reached its place of destination. Such a sight makes one wonder every time why in the world hods, horse power, or steam engines were not used.

VOLUME VI. NUMBER 2. | SAN FRANCISCO, FEBRUARY, 1885. | $2.00 per Annum, in Advance. Single Copies, 20 Cents.

BUSINESS PROSPERITY.

Large List of Building Improvements.

A CAREFUL study of the items in our Building Intelligence will prove the two following facts:—

That there were more brick buildings started during the month than for any similar period of last year.

That more than double the number of frame buildings, at more than double the cost, were erected, or are in process of erection, than for a similar period last year.

This is an extraordinary statement to make, when we take into consideration the large number of buildings reported last year. We find, during the month from the 10th of January to the 10th of February, there were started, in new improvements,

121 Buildings of the Value of $660,397.

Another important fact can also be noticed. A goodly portion of the number of buildings reported are erected by people who intend to

LIVE IN THE SAME,

And are not for purposes of renting. This fact seems peculiar when we take into consideration the cry of hard times, with which we have been greeted for more than a year past, and proves that many people have done far better, financially, than they have been given credit for.

IN THE COUNTRY.

We also notice a gradual increase in the number of improvements that are contemplated in the country. A more hopeful feeling seems to pervade amongst our country and suburban residents, and we may look for a much larger demand for the various articles needed for building purposes.

Mechanics' Institute School of Drawing.

THE Directors of the Mechanics' Institute have decided to establish a free school, where those who so desire may take lessons in drawing, both architectural and mechanical. A full account of the same will appear in our next, as the action of the Directors was taken too late for more than a passing notice in this issue.

Readers of the "CALIFORNIA ARCHITECT" will confer a favor upon the publishers, and derive material benefit themselves, by mentioning this paper when opening correspondence with advertisers. Drop us a postal card when you have written to an advertiser, give us his name, and then we will put you in the way of getting the benefit. Don't forget this.

Coterminous Excavations.

THE construction placed by the Supreme Court of this State, in the case of Aston *vs.* Nolan, upon the law relation to the "rights of coterminous owners," leaves the question in such shape, with an "if" added, that hardships have been experienced by very many who have undertaken building improvements since the rendition of the decision, owing to the unwillingness of caviling parties to submit cheerfully to any law or ruling of courts, which does not in very plain terms remove all doubt and question as to meaning, application, and finalities.

This vexatious question has occupied a prominence before the courts, and among owners of property for many years, and large amounts of money have unnecessarily been expended and *wasted* in legal contests, and moneys paid to avoid litigations, because the sections of the code upon which the question hinges are so constructed that it may be swung more ways than one, and whether this way or that, the appearance of consistent reversal seems to remain.

The latest ruling of the present court of last resort reverses the interpretation of the *code* as enunciated by the same tribunal, in the case of Hood *vs.* Zile, which imposed upon those excavating for building purposes, responsibilities which do not exist under the present ruling; and if the decision was free from doubtful meanings, the case would be clear enough for all practical purposes. But the wording—"Each coterminous owner shall be entitled to the lateral support his land receives from the land of the other," is an undefined something that evolves an uncertainty, as far as the *land* is concerned. The decision in reference to sustaining and underpinning buildings in such case, is fairly clear and well defined, except for the mean little "IF" which the learned judge preparing the opinion saw fit to drag into the case, in the following language: "*It may be added, IF the building has stood for a period of five years (in this State), before the excavation, the person who erected it has acquired a specia of easement in his neighbor's land—a right to the support of his building as well as soil. No such question as this last is presented in the case now before us.*" This interpolation of an outside matter, which did not belong to the case before the court, has worked a hardship, unjustly, because while not of the case, yet made part thereof, furnishing a new groundwork for contests and law suits, and the basis of refusal to those not willing to assume expenses and responsibilities which should in all justice rest upon them.

However much in harmony with ancient law, and legal logic and theories, the absurdity and unjustness of the "five year" proposition is so manifest that it is not to be wondered at that people generally express surprise that such a doctrine should find recognition at the hands of an intelligent tribunal in the year 1884; particularly in the case named, as its recognition in a certain sense nullifies the force and contradicts the decision in its main issue; and farther, the "five year" doctrine is discriminating and unfair, in this, that it protects the owners of old, delapidated, and rickety structures from the costs and expenses which the same rule of law imposes upon parties who happen to own structures not more than five years old, thus affording protection to a certain class of buildings, hundreds of which in San Francisco are a disgrace to the neighborhoods where located, while better, more valuable, better tax-paying property is excluded from an equal right to protection. The injustice in such cases is often aggravated by the fact that the cost and expense to the progressive man making new improvements, of holding up and underpinning some of the *more than five year old* structures, amounts to more than the whole concern would bring, exclusive of the land, if offered at private or public sale.

San Francisco Chapter American Institute of Architects.

THE regular monthly meeting of the Chapter was held in the rooms of the Art Association on Friday evening, February 6th. Vice-President Albert Pissis occupied the Chair. The committee appointed to prepare articles of indenture for students, requested further time, as it was their intention to be very accurate in the form of indenture presented for approval.

The committee appointed to consider the feasibility of establishing technical schools made the following report: They had a lengthy interview with Mr. Cornwall, the President of the Mechanics' Institute, and that gentleman stated that the institute had already taken the matter under consideration. It was one of the principal aims of the Society to cultivate our young in the mechanical arts and sciences. Room for the purpose could be had in the pavilion, and, no doubt, if the Chapter thought best to establish classes under its own supervision, the institute would provide space and light free of charge. Mr. Cornwall promised to meet a delegation from the Chapter at any time, and after hearing any propositions that may be advanced, to lay the same before the Board of Directors for consideration.

The opinion was also expressed that some of our wealthy citizens would gladly donate money for the maintenance of technical schools.

Emil John was unanimously elected an associate member. The following letter is self-explanatory, and, after being read, was ordered spread in full upon the minutes.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

[INCORPORATED IN THE SEVENTH YEAR OF WILLIAM IV.]

9 CONDUIT STREET, HANOVER SQUARE, LONDON, W., January 13, 1885.

My Dear Sir: I am much obliged to you for your letter of the tenth ultimo, and also for the copy you inclosed of a letter addressed by you and two other gentlemen to the Secretary, San Francisco Chapter of the American Institute of Architects, both having reference to the American Exhibition, to be held in London in 1886. For the moment, I am unable to do more than state that British Architects are certain to give a very hearty welcome to any colleagues from the United States, and that the President of this Institute is one of the Council of welcome formed for the purpose of formally receiving Americans who may visit this country during the period that the exhibition remains open. When the time comes, it will be possible to go into the details of the matter, and then probably architects on both sides of the Atlantic will be able to communicate with each other with more definite aims than can be done at present.

I am, dear sir, yours very truly,

WILLIAM H. WHITE.

Augustus Laver, Esq., Stock Exchange, San Francisco, U. S. A.

The following resolution was adopted:—

Resolved, That the Vice-President and Secretary be empowered to forward to the Union League Club of New York, a resolution expressing the approval of the San Francisco Chapter, American Institute of Architects, in regard to the repeal of duties on works of art.

Mr. Gash gave notice that at the next meeting of the Chapter he would read a paper on the Geometrical Square and its application to architecture.

Our Yearly Reminder to Subscribers.

IT has always been our custom, after the December issue of each year, to prepare a complete list of all subscribers who are in arrears, and forward to them, by mail, a statement of account. The same course is pursued after our January number has been printed, and to every subscriber is sent a bill for $2.00, the amount for subscription to this Journal for one year.

We are pleased to state that in all but a few of the answers received, the subscription has been renewed. Some, however, have demanded to know by what *right* we send this Journal after the time has expired for which it was ordered.

We do not claim it as a *right* to keep on sending this Journal after expiration of time for which it was ordered. We simply follow the custom of other Journals of the class to which this belongs.

One of the employees of the Post-office Department, in referring to the subject under consideration, remarked that the Government itself recognized the right of a subscriber to notify an editor to discontinue sending his publication; for the purpose of such notification, and in order that publishers may receive the same, printed Government forms were prepared, by which it was made imperative for all postmasters to notify publishers if their journals or papers were not taken from the office, and stating reasons, if known, for their non-delivery.

A subscriber receiving any paper after the expiration of the time for which it was ordered, has simply to say to the postmaster, "I do not want that any longer." The editor then will receive one of the *forms*, with the proper blank filled out as—"refused"—the name would be scratched off the editor's list, and account balanced.

Should, however, any party after subscribing to a journal, receive the same longer than the time for which he subscribed, he is held responsible for the same as long as he takes it out of the post-office. We endeavor to send to every name on our books a true statement of account on or about the 20th of each January. We are but human, and it may be that, in the thousands of accounts sent, a few errors may occur. Should this happen, or should a subscriber receive this Journal after his subscription has expired, we will only be too happy in correcting the mistake, or with a thank you for the help you have extended, and a wish that you will soon renew, will cross your name from our books.

Our *yearly reminders* are not intended as a *dun*; they are simply *statements of accounts*, and we trust that all of our subscribers will recognize our right to send such statements, and promptly forward us the amount due.

Amending Defects in Our Sanitary Law.

SENATOR WHITNEY, of Alameda County, has introduced a Bill in the Legislature, the object of which is to remedy certain defects that are found to exist in the law as passed by the last Legislature, granting to Boards of Health power to regulate the plumbing and drainage of buildings. The law as originally passed has been in force during the past eighteen months, and has given satisfactory results to owners, architects, and tenants.

It seems, however, that the law as it now stands is only applicable to this City, and the object of Senator Whitney's Bill is to have the same apply to all cities in California, so that the inhabitants of Sacramento, Stockton, Oakland, Los Angeles, etc., may derive the good benefits of a carefully prepared sanitary law, as well as the citizens of San Francisco.

We sincerely hope the Bill will pass in the shape offered by the senator. When it is taken into consideration that the parties who drafted the orignal Bill were not lawyers, or even persons versed in the simple rudiments of law, but simply plumbers, the necessity for its amendment is not so much a cause of surprise, as the fact that it has stood the fire of criticism so well for eighteen months, and even in the amendment but few words are changed, the principal of which is to substitute the word *county* for *city*, thus making the application of the law general in its results.

In other and older communities, the work of preparing sanitary laws is not left to the artisans in that line, but is taken in hand by physicians, professional men and philanthropists, who, by reason of their circumstances, can devote more time to matters so closely connected with the health of the community.

Our Redwood Exports.

GRADUALLY the attention of wood-workers in every part of the civilized globe, is being drawn to the excellent qualities of California Redwood for various kinds of finishes. We think that Chicago has the honor of being the first on the Eastern city list, in which Redwood was used. The straight grain and the more than ordinary widths of the lumber, led to its adoption in the manufacture of coffins a use to which it is peculiarly suitable on account of its lasting properties when placed under ground.

In January, 1883, the first cargo of lumber from this port to Europe was shipped on the *Helene*. Her cargo consisted of 232,000 feet, valued at $7,800. In November of the same year another vessel was cleared with lumber of value of $8,400. In 1884, seven ships left for Europe loaded with California's choicest lumber.

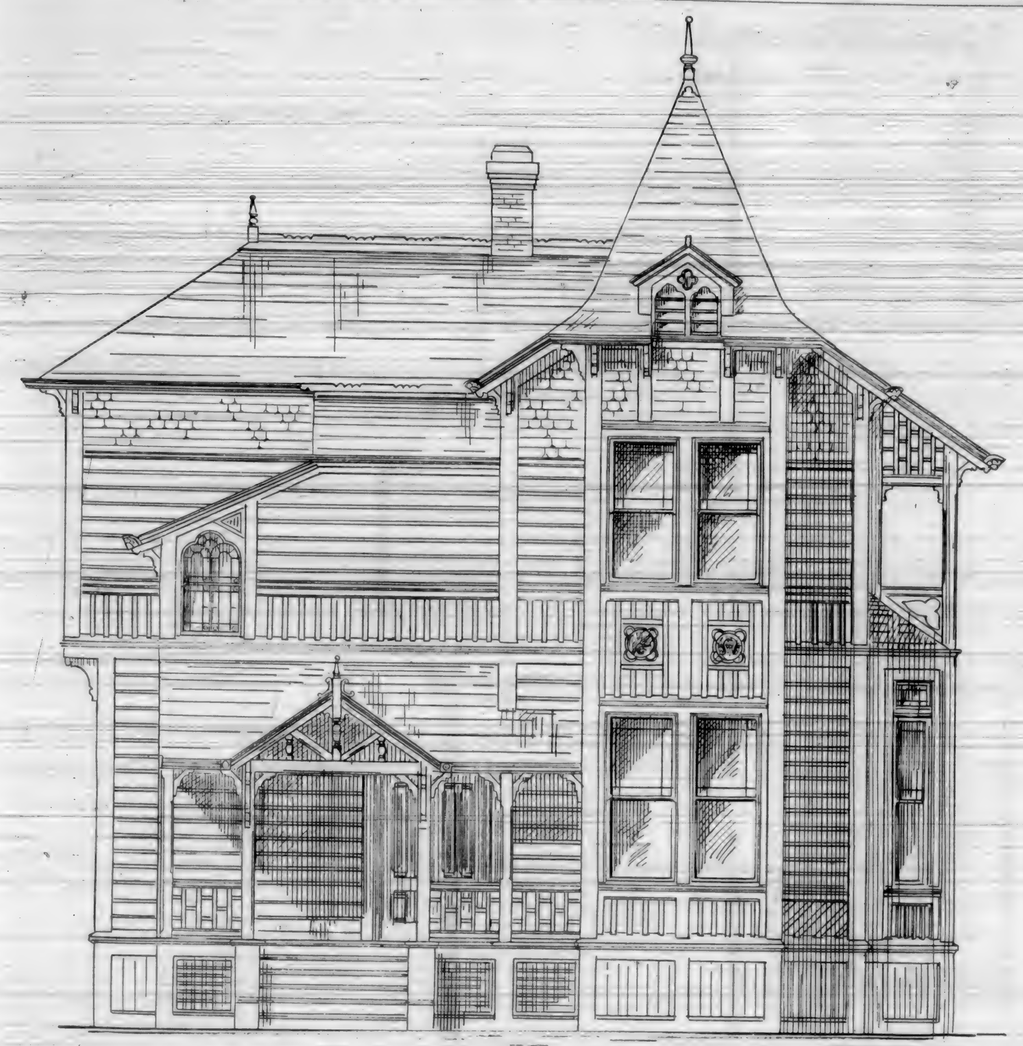
Below will be found a tabulated statement, which will show the growth of this industry:—

Shipped.	M Feet.	Value.	Per M.
January 23, 1883	232	$ 7,800	$33 62
November 30, 1883	418	8,400	20 07
January 15, 1884	919	18,400	20 05
February 23, 1884	417	13,000	31 11
May 19, 1884	272	5,400	20 00
June 13, 1884	492	14,400	29 18
July 31, 1884	724	21,100	29 14
September 26, 1884	935	22,700	24 27
October 22, 1884	682	19,900	29 18

The high cost per M for the first ship load sent is due to the fact that extra pains were taken in the selection of a prime quality of redwood. In addition to the lumber, the ship's hold carried 1,000 redwood ties and 140,000 shingles of the same material.

So far this year, on February 2, 1885, but one vessel has been cleared for Europe, the cargo consisting of 712,000 feet; value, $17,800. We may reasonably expect future shipments to increase in number and value, as the merits of Redwood become more fully known. A list will be kept, which will be given from time to time, in order that cognizance may be kept of this growing source of wealth to this coast.

Lessons in Carpentry by the Aid of the Slide Rule. The design of this work is to furnish a cheap and simple explanation of the SLIDE RULE. The simple combinations of which this instrument is capable actually contain more practical knowledge than can be found in huge volumes. Practical examples are given of the workings of this instrument, by which the mechanical student can readily understand the vast variety of its combinations, and be capable of finding length of rafters, braces, etc., in much less time than by the use of the steel square. **Price, Three Dollars.**



FRONT ELEVATION OF $5,000 COUNTRY DWELLING.—SEE "OUR ILLUSTRATIONS."

Our Illustrations.

THE illustrations in this number represent the plans and elevation of a $5,000 country dwelling. Credit for the same belongs to Max G. Bugbee, one of our rising California draughtsmen.

It was the design of the author to show a plain exterior, and yet have sufficient architectural display to make the house present a pleasing and comfortable appearance. All of the various elevations are shown, so that almost any adult can readily comprehend the looks of the building when completed.

Our engravings illustrating the plans of the different floors are very plain, and will bear careful study.

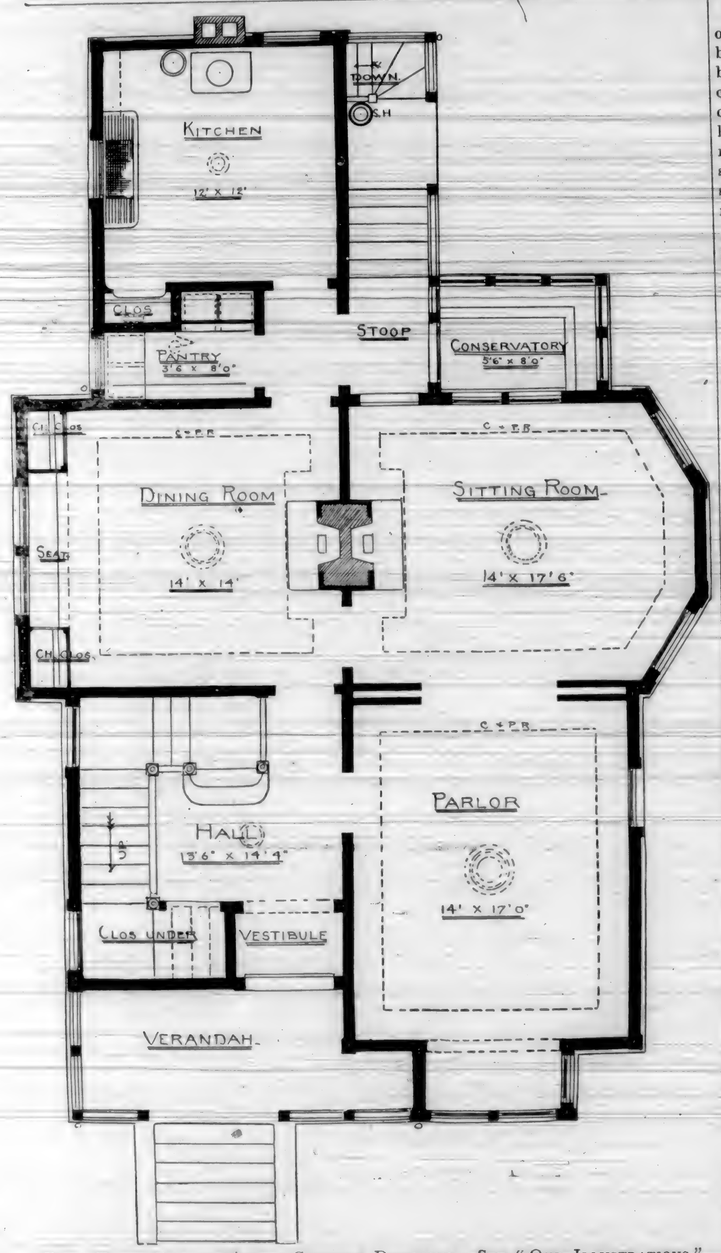
The estimate of cost has been carefully prepared, and at present price of materials will fall short of the amount quoted.

ESTIMATED COST OF DESIGN FOR FRAME DWELLING SUBMITTED BY MAX G. BUGBEE.

Labor	$1,025 00
Plumbing and gas-fitting	500 00
Mill work	1,500 00
Plasterers' work (2,375 yds.), 220 ft. cornice,	654 50
Painting and glazing	305 00
Hardware, tinning, etc	$162 50
Bricklayers' work and sewer	200 00
Stairs, inside and outside	165 00
Shingling (24,000 plain, 4,000 cut)	146 00
Rough lumber (11,625 ft.)	261 75
Rustic battens, etc. (4,136 ft.)	165 45
Flooring (2,850 ft.)	99 75
Total	$5,184 95

Test of Glue.

APPLY your tongue to a piece of glue; if it tastes salty or acid, reject it at once. The same operation will also bring out any bad smell the glue may have.



First Floor Plan of $5,000 Country Dwelling.—See "Our Illustrations."

Make Contracts for Lumber.

We would advise those who intend to build sometime in the near future, but whose means will hardly let them do so at present, to make a contract with one of the firms who are selling lumber much below the cost of production, for any certain amount of lumber to be delivered on or about a specified time, at the prices now ruling in the lumber market.

We know this has been done by more than one firm. No surer way of making money can be thought of than by securing a lot of lumber at the ridiculously low figures for which it can be had at present. First quality lumber commands $13.00 per M, and we know of one lot for which only $12.25 was paid. At this rate, it will pay any one to stack a few thousand feet away, as we can assure you, in a short time a much higher figure will be demanded.

Make a contract for lumber *now*, for the principal cause of its low price will soon be removed, and you will then regret when it is too late.

BACK SAWS.

How One Little Word Can Change the Whole Meaning of a Sentence.

In our last issue we presented an interesting article from E. H. Davies, of Santa Clara, entitled, "Back Saws." The type made one sentence read as follows: "And will take seven times as much pressure to get it out *as* straight as before."

The first *as* should be *of;* so the sentence would read, "*get it out of straight as before.*" Only a word of two letters, and yet notice the difference in the meaning of the sentence.

The Gelatine Edition

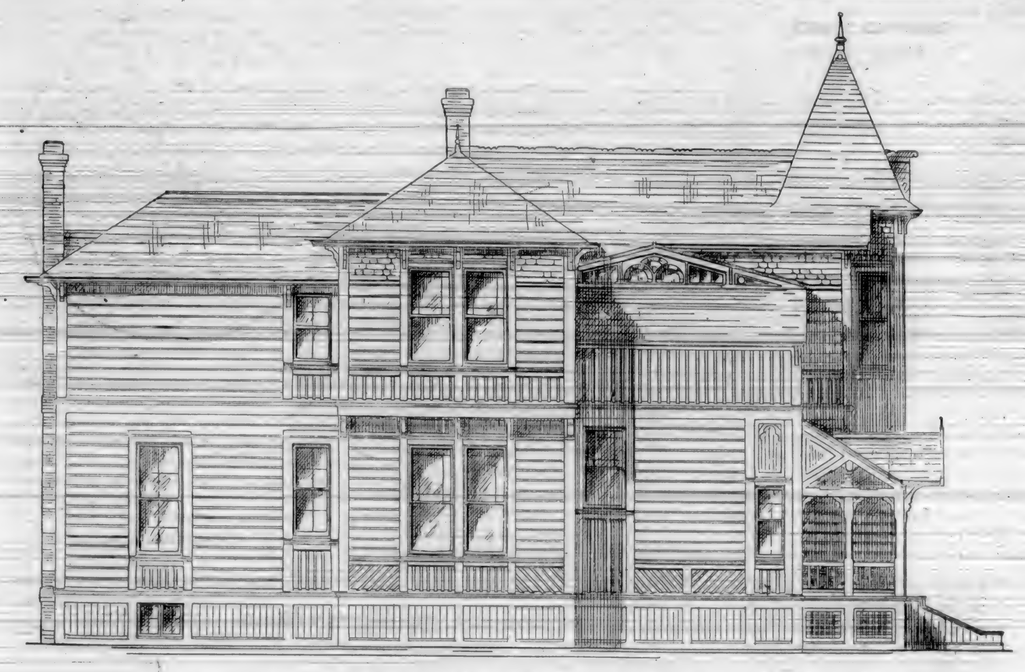
Of the *American Architecture* is a splendid number. It represents a perspective sketch of the State Capitol, at Hartford, Connecticut, and, as far as the engraving is concerned, it is the best and most artistic illustration of a building that we have as yet seen in print. Every architect and student in the United States should not only deem it a privilege, but a *duty*, to encourage publishers by subscribing for such journals as the one mentioned.

Low Price of Building Materials.

For some time past lumber has been selling in this city much below the cost of production. Large lots have been sold as low as $12.25 per M for rough, and $21 for surfaced. During the past week, however, the price has been advanced to $14, and it is only a question of little more time for the market to regain figures somewhat near to those of the schedule that existed before the "break."

Bricks have been held very steady for a long time past, but the combination has been broken, and prices have declined from $1.50 to $2.00 per M. Good hard-burnt brick can now be had for $9.00 per M.

Hardware.—The prices of all kinds of hardware have been advanced from 10 to 15 per cent. since the beginning of the year. Even at this advance, the prices are very low. In fact, all kinds of building materials, and labor as well, are at too low a figure for beneficial employment to a large proportion of our wage workers. To those contemplating building, no more favorable opportunity than the present will occur for some time to build cheaply.



Side Elevation of $5,000 Country Dwelling.—See "Our Illustrations."

Reproduction of Redwood.

A short time ago, the following p agraph appeared in the columns of one of our local journals.

"*The redwood tree, as is known, will not reproduce itself, or rather, to speak more correctly, it grows so slowly that its growth is not appreciable. Hence, in time, all the California redwood will be exhausted.*"

The writer of the above has evidently traveled but very little among the redwoods, and knows but few of the characteristics of the timber which he seeks to disparage. The truth is that there are no known lumber trees that reproduce themselves in so prolific a manner and so quickly as the species under consideration. In our travels, we have repeatedly seen young shoots from three to twelve inches in diameter growing from stumps of trees that have been felled; it is evident, therefore, that time is the only thing necessary for a duplication of the original growth in a devastated forest. These young shoots will sometimes, though rarely, number as many as a dozen from a single large stump.

Again, even when a section has suffered from fire, in a short time, in numerous places, these young shoots will be noticed growing from the parent stump. Knowing the above to be a fact, is it not about time that our Legislature took pains to enact laws for the preservation of the young trees, and not allow, as is too often the case, the young timber to be cut for posts, etc., merely because it saves some indolent people a little labor in obtaining "just the size they want" for their purpose?

The Iron Workers' Strike.

Since the publication of our January number, a material issue between the proprietors and workmen of the boiler making and iron working establishments in this city has culminated in a general strike, the workmen refusing to accept or compromise the exaction of the proprietors for a reduction of fifteen per cent. in the rates of wages.

The reduction is based upon and claimed as a necessity to the activities of trade, to offset the pressure of Eastern competition, where wages, coal, and the raw materials are much cheaper than in San Francisco, and sufficient to overcome the extra cost of freightage and charges.

This is met by the workmen upon general as well as specific principles, not to accept a break in present rates of pay, as doing so would fix a precedent to other lines of manufactures to demand like reductions, and so effect a general break down in the rates of wages all along the line.

That Eastern competition has always existed, and is no greater now than heretofore, and furnishes no new or sufficient argument in favor of the reduction.

That the living expenses of workmen in San Francisco are greater than in most of the Eastern cities, and require better compensation to produce equal results and comforts with and to those who work for less pay in places where house rent and the necessaries of life are less costly than in San Francisco.

That the competition complained of is stimulated by the lack of larger plants and greater working and manufacturing facilities in the several establishments.

Several attempts at compromise have been made, but at present writing the outlook presents a determined resistance on the part of the workmen, without any certain indication as to final results. Competition is said to be the life of trade, but when carried to the extent of depressing the laboring classes, and drawing from the facilities of life comforts, it becomes a hardship, and it is but natural that the pinched should squeal and refuse to submit. Cutting wages as a means of whittling competition down to a profitless edge, is certainly not a pleasant edging to men who have families to support, and facts favor the assertion that competition, too severely forced, benefits those who purchase at *less than fair prices* at a sacrifice to those who produce. And if producers see fit to cut each other, they should spare those who perform the labor of producing.

[Written especially for this Journal.]

REDWOOD TIMBER.

Its "Staying" Properties.

As we look at the decomposing particles of material in the building, there is behind all these effects a cause by and through which the timber responds to the decomposing influences of the atmosphere with which it is brought in contact, while other and contingent portions, often of the same timber, but generally different sticks cut from the same tree, seem to be impervious to these influences.

Years ago, architects (the reason for which they had no explanation) would strive to reconcile the seeming paradox by placing the timbers in certain relative positions in the building as compared to the tree before being cut. We often wondered at the reason for this, and though these men constantly exposed themselves to ridicule and sarcasm, nevertheless, if let alone, they invariably succeeded in overcoming the gravest of objections relative to the use of certain woods notorious in that country as quick to decay, *in spots*. If we examine carefully, by means of the microscope, a vertical section of redwood, for instance, we shall find on the micron the form represented in Fig. 1.

Fig. 1.

The parallel lines running lengthwise represent the grains as seen with the naked eye, the small spots the resinous matter peculiar to the family of plants of which this timber is a member, while the irregular lines running in every direction, and when a general longitudinal direction never crossing the grains of a perfect tree, thoroughly ramifying and permeating every particle of the cellular matter, seems to be the transit ducts for conveying this resinous fluid all through the interstices of California redwood. This, so far as could be demonstrated by means of a dry sample of wood, seems to obey the general law of crystallization, and gradually settles into these cavities, as the sap winds its way upward. As another proof that this condition of things is common, as we approach what may be termed the upward portion of the tree, these crystals gradually become smaller, and when the topmost branches are reached they cease to assume this form, seemingly present only in solution or sap, notwithstanding the fact the twigs and leaves contain them but in a different form, showing that the solution, as it may be called with the utmost propriety, slowly deposits this sediment in the interstices on its way *upward*, and, when the utmost limit has been reached, becoming a vapor, leaving, *not depositing*, the remaining portions of this resinous matter, hence the diverging form of crystal as it appears magnified.

A very interesting and important phenomenon is manifest in the protuberances and excrescences often seen in these celebrated trees of California, but owing to the lack of sufficient samples we will not discuss these at this time, holding for the subject-matter of another letter. It will be seen as the right-hand side of the cut is approached, though the grains appear but slightly thicker, the lines and spots become less marked; it follows, then, that as the tree grows older, and the rings larger, they do not absorb this matter in the same proportion. To the contrary, so far as we were able to judge from chemical analysis, the ring seven years from the heart contained as much of this resinous matter as a ring twenty or more years nearer the bark, where the tree was at least three times larger. This elicits a botanical consideration of plant growth, not of vital interest to the majority of our readers. Suffice it to say that the conclusions deducable from what has already been proven, each year the flow of the fluid containing this matter ceases, the entire energy being directed to the formation as well as maintenance of the ring being formed each succeeding year.

It would follow, therefore, that, so far as the life or staying properties of redwood are concerned, the nearer we approach the bark the less value the timber in this respect, for, while on the one hand the cells are greater in number and more closely huddled together, the outer edge contains fewer cells, farther apart, larger, and not so evenly distributed. Again, nearer the pith or heart, as stated before, these cells are filled with one of the best and efficient elements to repel moisture known; while further out they are merely coated, not filled; hence the moisture is invited to enter, and being subjected to the vagaries of a changeable climate, together with the acid-impregnated atmosphere of cities, it is soon absorbed or set free, and the timber rots. To this end

"We'll deem it not folly
Nor esteem them weak"

Who persist in placing the inner side of timbers to the greatest influences that tend to decompose.

By examining Fig. 2, taken from a thin vertical section of the same kind of timber, it

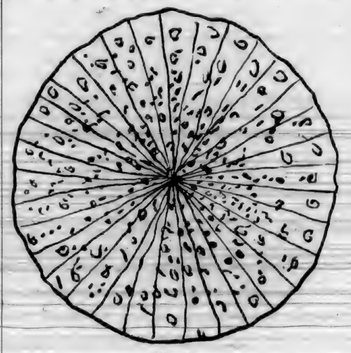

Fig. 2.

will be seen that the cells decrease in number and increase in size as we approach the outer edge. This sample was but a single ring, and, by means of an ordinary compound instrument, it is very easy to determine the inner from the outer side of a stick, merely by the size and number of these resin cells.

Supplementary to what has already been said, the question of strain or tension of this interesting wood should be discussed from the physical features as illustrated with the microscope. Chemistry can do nothing to show this, while physical appliances and mechanism are too apt to consider these considerations as beneath the dignity and unworthy the consideration of that mighty science.

If it was desired to bend or otherwise distort any substance by means of mechanical forces, we would naturally place the molecular portion at the radius; for instance, if a bar of iron was firmly attached to one of lead, bending toward the latter would displace fewer molecules than the former, but the reverse way would furnish the greater resistance. Theoretically, then, California redwood will bend easier toward the bark, but would respond with less force than toward the heart; hence, if strength is the primary motive, the timbers should always be placed in such position that the inside will meet the resistance. If we wish spring, quick reaction, and flexibility, the reverse side should be exposed. Now let those who have practically demonstrated this theory, for such it is, say whether this is a pertinent conclusion or not. In any event, so far as the staying or lasting properties of this timber are concerned, we are positive that these conclusions are conclusive, but it should constantly be borne in mind that, in some instances, we might say many, all these properties we have tried to illustrate are brought into requisition, it being difficult to tell which are of the most importance in this event. By careful mathematical calculations, it will be found that in very many instances when we bring into requisition one of them, the other one next in importance will only be contingent, and in some instances the strength and property required of a piece of timber, presenting the varied characteristics

Side Elevation of $5,000 Country Dwelling.—See "Our Illustrations."

of the material in question, may be so figured that instead of detracting from one by bringing into requisition the other, each may be augmented by allowing the other its due consideration and importance, as regards what is required of it in the architectural mathematics.

"First Class."

There is no term of words used in connection with house construction more hackneyed, profligated, or meaningless, than "first class;" no two words design to express a fact, which are more frequently misapplied, or where they so seldom express real intent, purpose, or quality.

"First class," when properly, honestly, and intelligently applied, comprehend and express more than can be expressed by any other two words in the English language, in the same connections, and are therefore pre-eminent as expressing goodness, merit, excellence, and superiority; but the mechanical, commercial, mercantile, and other prevailing business libertinisms of the day, debauch and abuse the term, and apply it when and wherever its use will best serve purposes of deception; hence it is utilized by the frauds of the world under every guise, and is made the watch-word and cry of those whose success can be accomplished only through and by deceptions. It is safe to assume and fix as a fact, that those who are ever prating their personal or business "first-class" isms, require watching, particularly in building connections.

There is no need of men who produce first-class work commending that which commends itself. "First-class" workmanship and materials carry in themselves conclusive evidence as to character and quality. It is the second to tenth rate demagogues, who understand nothing of the honest, practical meaning of the term, who are the more free in its misuse and misapplication, for purposes and with intent to deceive; and it is unfortunate that owners and purchasers so generally permit themselves to be beguiled by this designing class of individuals, who feed and fatten by the practice of studied deceptions, asserting merit and reputation where none exist.

Our Slide-Chimney Thimble Device Patented.

Some fifteen years ago, the Senior Editor of this Journal perfected a slide thimble device for chimneys, which was and is more perfectly fire-proof than any other, and which saves and prevents all cracking of the plastering around the "stove pipe holes." We have used them in our practice ever since, with entire satisfaction, and with benefit to clients. Far less meritorious devices have been patented, and this deserved the protection of Uncle Sam's patent laws, but we did not apply; and as we did not avail ourselves of that advantage, we notice in a last year's number of the *American Inventor*, that one E. S. Sweetser, of Wakefield, Massachusetts, has done so in our stead. The principle of the two devices are exactly the same, and the shape and form alike, varying only as between the round and square ends of the slides and slide plates. And every word that is said in the journal mentioned recommendatory of the device, has been expressed by us scores of times in reference to our own, and is true. If the patented thimble is an original invention with Mr. Sweetser, there is in it a most remarkable coincident of thought and conception between the Massachusetts man and the Editor of this Journal.

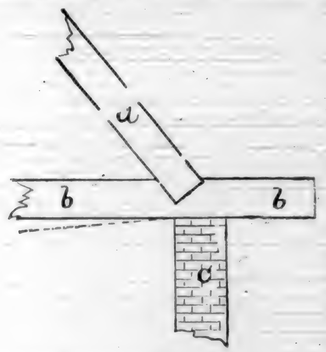
Strength of Timber.

It is a fact well known to all architects that the more kinds of material we put into a structure the more we multiply differences of expansion and contraction, and in some cases that have had our attention called to, the structure has been found sadly out of line, and its general appearance deteriorated by the difference in contractility of materials and even kinds of one material of which composed. Suppose, for instance, we construct a building eleven stories high, the walls of brick, wooden girders and partitions; we place joists across, these are green; we have eleven floors laid upon this green timber. The studding for each story is placed on a firm foundation in the basement, directly over the top of which the partition timbers of the adjacent story are put, followed by another and another until the roof or rafters are reached, when the timbers or studding for the last story are the principal, and often the only support. If we allow the usual per cent. for shrinkage by seasoning, is it unreasonable to suppose that, with this, eleven feet in width of joists will so shrink that the roof will, by its own gravity, fall nearly one foot? Then is it not equally pertinent to conclude that the base of the rafters resting on opposite walls alone will tend to crowd out until the apex finds solidity on the studs of the center and thereby rendered unsightly and possibly unsafe? In explanation of this theory let us suppose the following cut: c to represent the brick wall; b,



the cross-beam, and a, the rafter. The timber b, is supposed to run entirely across the structure, and a, meeting its companion at the apex, stands as it were while together; separated, each will fall. To guard against settling and the like, supports, by means of cross sections or collar beams, are brought into requisition, while these in turn are supported by the studding in the interior of the building. Now at the angle this rafter is placed in, if b should shrink the merest fraction of an inch, the joint ceases to be perfect, and the shoulder bears none of the weight of the superstructure, the same being all transferred to the base of the rafter; and while the cross-section is made of timber supposed to be of the same degree of dryness, the entire weight is thrown on the wall a certain distance from the center.

We will now go to the story below, where we find this timber, b, resting on the partition studding; this, being seasoned the same, it shrinks; b, having the pressure from above, follows the shrinking, and rapidly assumes the shape and position indicated by the dotted line. It will be seen by this that the wall receives the pressure in an oblique manner, and is subjected to a force that will eventually crowd it out of line, as a result in a few years at farthest. We have a building the walls of which are none of them square, not a door or window will open and shut, the plastering and all other interior decorations will rapidly deteriorate in beauty, while in accordance with the force of gravity, all will soon be a mass of semi-ruins. As we have proven, we hope to the satisfaction of our readers, timber invariably shrinks toward the center; hence if mill-owners and operators in filling orders for large stuff would see that their timbers were gotten out so as to lie on edge when in position, and architects see that they were placed in position as ordered, the shrinkage would only tend to make the joints stronger and the floors more solid. These are little things of themselves, but in the aggregate assume great importance, and more especially to those who pay the little bills or suffer the inconvenience of occupying buildings all askew.

The Arch.

The earliest trace in antiquarian researches has assisted us in detecting the first bridge, and to show that it was a tree which had fallen from one bank to the other of some mountain torrent. The method of communication thus supplied by accident, men would soon learn to obtain for themselves by the rude resources of art, and ere long the opposite banks of rivers would become connected by means of timbers or flag-stones supported upon piers.

The application of this notion of a bridge seems to have constituted the whole art of bridge making up to a comparatively recent period. It is, however, altogether inadequate to the passage of deep or rapid currents, and fatal to navigation. We accordingly find the Egyptians, although they swarmed along the banks of the Nile, never built for themselves a permanent bridge across that river.

The Tigris and the Euphrates, on whose banks dwelt that enterprising nation of remote antiquity, the Chaldeans, was bridgeless. And even in the age of Pericles there was no stone bridge over the river Cephissus at Athens.

Necessity is said to be the mother of invention, but there are certain matters which she has been exceedingly slow in coming to. The birth of the discoverer of the arch is a memorable example. Of Europeans, the first who appear to have made the discovery were the Etruscans; the earliest existing specimens of the arch in Europe are to be found among the ruins of the Etruscan tower of Volaterra.

To the Chinese the secret of the arch appears to have been known from time immemorial. In fact it is difficult to fix upon any useful contrivance which is not at present in some degree known to that singular people. They certainly used the arch long before the idea was conceived in Europe. It covers the gateway in their great wall; they availed themselves of it in the construction of monuments to their illustrious dead, and in the formation of their bridges; and we are told that there were stone bridges in China three or four miles long, and arches 600 feet in span.

From the Etruscans the secret of the arch passed to the Romans, and it was soon employed in the construction of bridges over the Tiber. Of these, several remain; they are, however, but awkward specimens of the art of bridge building. Their narrow arches were supported upon high, unsightly piers, which formed a serious obstruction to the current. The Romans have, nevertheless, left us, in other parts of their dominions, bridges of extraordinary strength and beauty. Of these, that of Alcantara is perhaps the most remarkable; its roadway is about 150 feet above the level of the stream which it crosses, and its arches are 100 feet in span. It was built by Trajan, in whose reign was also erected a bridge over the Danube, of which many incredible things are told by Dion Cassius, of which no hing is to be seen but now and then the foundation of a pier. He built it that he might conquer the Dacians; his successor destroyed it, that he might restrain their incursions into the empire.

In those troublesome times which succeeded the fall of the Roman Empire no bridges were built. Rivers were for the most part passed by fords or ferries; these frequently became subjects of contention between neighboring barons, or were taken possession of by outlaws, and travelers in availing themselves of an insecure method of transfer were subject to the certainty of being heavily taxed, and the chance of being plundered.

It was about the commencement of the twelfth century that one Benezet, a cowherd, appeared in the Cathedral of Avignon and announced to the multitude a special mission from Heaven for the erection of a bridge over the Rhone at that city. By efforts little less than miraculous this singular enthusiast contrived in the course of a few years to erect a bridge, which, whether considered in reference to its enormous dimensions, or to the local difficulties to be overcome in its construction, claims to be ranked amongst the most remarkable monuments that have been erected by the skill and ingenuity of man. Unfortunately a flood of the Rhone carried it away. The labors of Benezet did not, however, altogether disappear with this bridge; he obtained a place among the saints of the Roman Calendar, and became the founder of a religious order called the Brethren of the Bridge, by whom some of the finest bridges in Europe were erected. Of these that of St. Esprit, on the Rhine, is nearly a mile in length; and that called La Vieille Bronde, over the Allier, is a single semicircular arch of 180 feet in span, and until the erection of the Chester bridge, which is 200 feet in span, was the largest arch in Europe. Of the same date was the old London bridge, the work of Peter of Colechurch, which would, however, greatly suffer by comparison with the labors of the Brethren of the Bridge.

From this period up to the present, the art of bridge building has continually progressed, and most of the European rivers are now spanned by arches with which the labors of former ages will bear no comparison, either as respects the boldness and grandeur of design or the perfection of their detail.

Plaster, How to Make and How to Use It. It contains accurate descriptions of all tools and materials used in plastering; description and action of every variety of lime and cement; instructions for making all kinds of mortar, and doing all kinds of plain and ornamental plastering; many important recipes given. Price, $1.00.

Rear Elevation of $5,000 Country Dwelling.—See "Our Illustrations."

Damp Houses.

The common bricks produced by most of the dry-clay machines absorb much more water than do those made by machines which thoroughly temper the clay. There is too much ignorance displayed in regard to the material produced by this line of inventions, and which enters so largely into the construction of buildings, and this lack of knowledge is often shown by those who ought to know better. In the desire to get up a showy house, "something that will take, you know," mistakes are too often made, which are usually paid for by the loss of health and sometimes by the sacrifice of the lives of those who inhabit them. Is it difficult to call to mind houses that people call "unlucky places," in which an unusual number of persons die? These "unlucky places" are for the most part nothing more or less than damp houses, resulting usually from the employment of porous bricks in the construction of the walls.—*Charles T. Davis, in American Architect.*

When you are filing a saw and the file gets gummed up don't try to work with it so, or throw it one side and get a new one. If you have no card to clean the file, take a piece of pine wood three-fourths inch square by three or four inches long. Rest one end of the file upon the bench; with the little stick strike the file nearly edgewise with a square corner of the stick, following the slant of the teeth. This will clean a file nicely and without causing half the wear that a card would. A little practice would enable you to clean a file in half the time it would take you to hunt up a card-cleaner.

Bound Volumes of 1884 Now Ready. Price, Post-paid, $2.50.

Getting up Stairs.

"If there is anything I like to see in a house," said Mrs. Domibus, "it is a handsome pair of stairs. We don't expect ours to be gorgeous or magnificent, but I want everybody who comes into the house to throw up both hands in admiration and exclaim, 'how lovely!' when they see the stairs. You see they are the first piece of furniture to be seen, and if they are all right it is no matter how plain the rest of the house is."

"You wish the stairs to be in the front hall, then, do you?"

"Why, of course! what else is the front hall for? Where else could they be? and what would the chambers be good for without a front pair of stairs?"

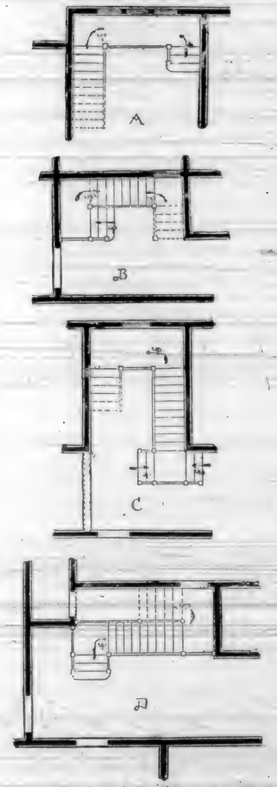
"Do you like a straight run?"

"I don't know what a 'straight' run is, but if you mean stairs without any turns or landings, I don't. How many kinds of crooked runs are there?"

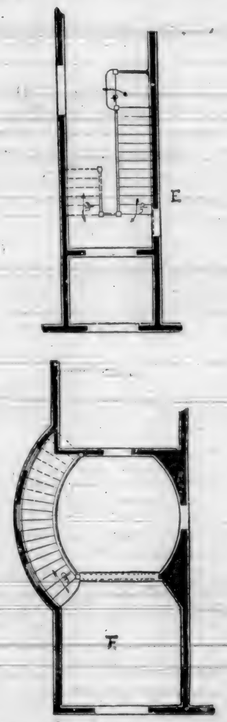
"Hundreds of them."

"Will you show me a few?"

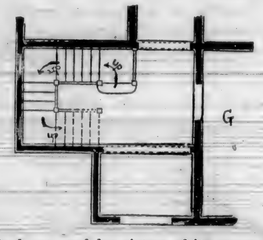
"Certainly. 'A' is a staircase that could



only be used with good effect in a large central hall or reception room. You go up three or four steps to a long, level platform, reaching quite across one side of the apartment, at the other end of which platform, you turn to the left again and complete the ascent. There are windows on this long landing, and it will serve various useful and ornamental purposes. In 'B' the stairs occupy a sort of recess or alcove at one side of the common entrance hall or passage way. You have a few steps to the first full landing, then several more to the half landing near the top, from which another short run carries you to the second floor. 'C' looks two ways for Sunday at the start. From whichever way you approach the stairs you can reach the first landing without turning a corner. The second landing is high enough for a door underneath it, and, if it happens to stand next an outside wall, for a window above it. 'D' is still more aggressive as regards room. The foot of the stairs is thrust forward into the wide hall and after turning once to the right on your way to the broad second landing, which is also high enough for a door underneath and a window overhead, you right about face sharply to the left for the



rest of the upward march. 'E' is the conventional, long, narrow hall with staircase clinging to one side of it. This is a variation from the familiar individuals of the class, inasmuch as it starts with a square landing at the bottom, runs up towards the front door instead of from it, and turns on itself by means of a landing near the top that spans the hall and makes an apparent division between the vestibule or the front end of hall and the interior portion. 'F' you might call a straight



crooked run, and by virtue of its many doublings it makes a comfortable sort of staircase in a limited space."

"Well, now, which of these will look the best?"

"That will depend mainly upon how they are treated by the architect who designs the details."

"And which will be most suitable for our house?"

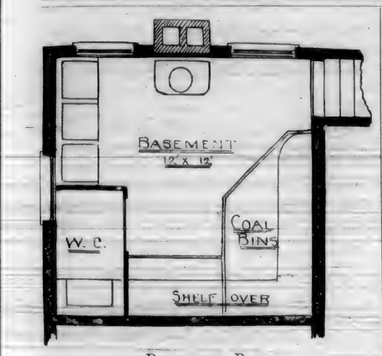
"That will depend entirely upon the plan, for, please remember, the stairs must be made for the house, not the house for the stairs."—*Builder.*

Wood Carving.

The hand carving of wood for house finish and interior decoration is becoming a distinct and permanent branch of industry. Much of this work has been done by amateurs as a pastime, but it has lately developed, to a considerable extent, into a "trade," industrially speaking. For fine furniture the carving of wood has for a long time had a place, but there appears to be a prospect that to the joiner's shop and work will be added those of the carver as a means of finishing interiors. Foreign workmen, at present, comprise the larger part of the workers in this industry, but the attention of our native workers has been directed to it, with the result of bringing it into general notice.

The idea that artistic hand work should be confined only to rare and costly material is hardly consistent with the demands of taste.

In the woods there is scarcely one that will not be beautified by hand carving. So common a wood as white pine is susceptible of producing very fine effects even when the wood is left in its natural condition. When first worked, it is a creamy white well calculated to show the shadows of relief; and exposure to the air soon deepens its tint. A thin varnish of shellac will tone its whiteness without producing a shiny surface. White wood is also a wood well adapted to carving, and the yellow birch is even finer. To these light colored woods may be added the three varieties of maple and also beech. The darker woods admit of bolder work—greater relief—and when united with the lighter colored woods make a fine combination. Carved white wood as a cornice for a room, the figures only slightly



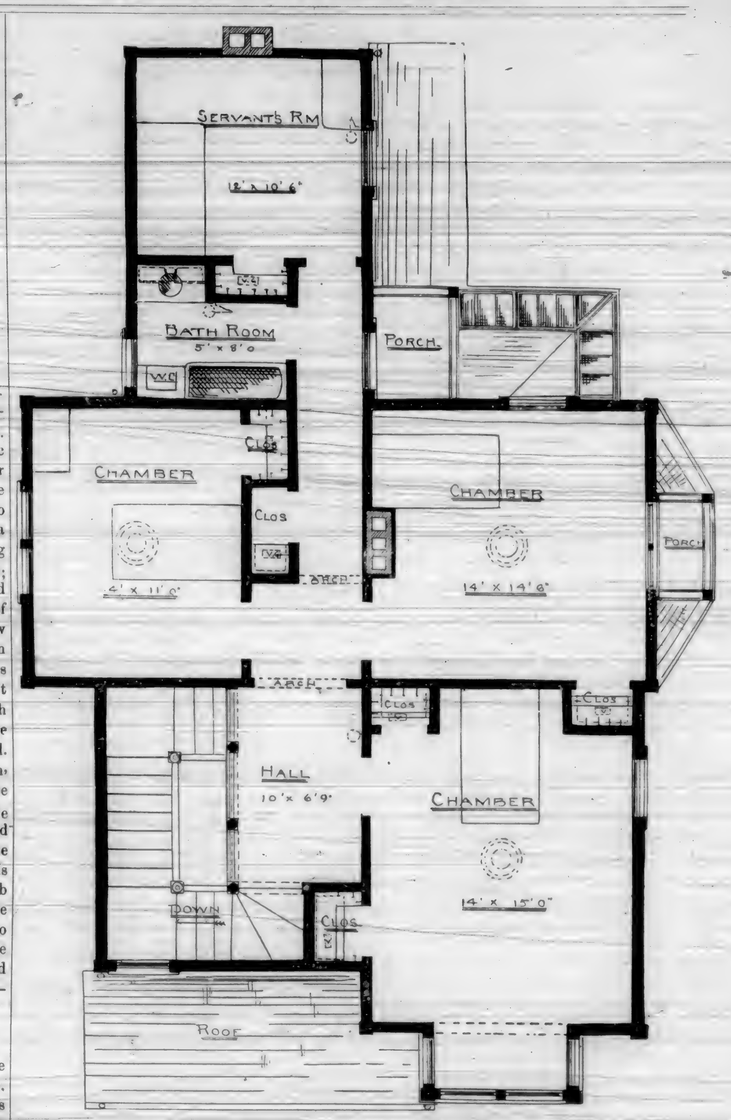
Basement Plan.

cut in, with cherry for the projecting moulding, produces an elegant effect in a parlor. The only finish is a thin varnish of shellac dissolved in alcohol, no touch of sandpaper being allowed to subdue the sharp cuts of the carving tool. There is scarcely any limit to the possibilities of wood under the hands of a skillful carver; straight lines and sweeping curves are not alone among its capabilities; it may be fretted, diapered, dentaled, and stippled, and cut into fine cross-hatcheling, if the workman has good tools and knows how to use them. As this is written, there lies on the desk a piece of butternut wood six inches long and about one inch diameter, that is cut into a triple spiral, of about three turns, each spiral being round and about the size of a rye straw. This shows the capabilities of wood.

Wood carving is a pleasant occupation, combining the attraction of taste with the pleasure of work. In many instances the carver is his own designer; it is better so, and the business is incompletely learned where the carver cannot originate, or at least design, his own work. The designs for an elaborate job are usually two, a plan and a profile. The profile is drawn in differently colored lines to indicate the relative depth or projection of the parts. The business offers an attractive field for workers who are artistically inclined.—*Scientific American.*

Where Grindstones Come From.

The grindstone makers of Nova Scotia live principally on the shore of the Bay of Fundy, and when the tide has receded and the reefs are left bare, they go down on the reefs with their tools, and blast out the rocks in as large pieces as may be. They then cut large holes in opposite corners of stones, smallest at the top, and put in "Louis bolts" with chains attached. These chains are set up on bars so that as soon as the tide rises enough to cover the rocks, a large boat called a "joggin" boat is floated over the rock, and the two chains brought up on each side of the boat are fastened to a stout pole which lies across the boat and projects over the sides a foot or two. The tide rapidly rising straightens the chains and lifts the rock from its bed, and the boat with its heavy burden—sometimes ten tons—is floated toward the shore, and when the tide attains its full height and the boat is as near the shore as is practicable, the stone is cut away by a few vigorous strokes of the axe on the middle of the pole, and the liberated boat jumps nearly out of the water. As soon as the tide recedes far enough to lay the rock bare, the men go to work with their tools and work them off into the shape we see them here in our large factories, and the smaller pieces are roughly "scabbled" off into the semblance of a small grindstone and then taken to the building, where they are turned in lathes by steam power and assume the finished appearance of the grindstones we see any day about us.—*Sel.*



Second Floor Plan of $5,000 Country Dwelling.—See "Our Illustrations."

Modern Architectural Designs and Details.
The plan of this work is very comprehensive in its character. Numerous designs are given illustrating the Eastlake, Elizabethan, and Queen Anne styles of architecture. Complete plans of each, together with full and comprehensive details, are produced in a manner that will gratify the tastes of any architect or property owner. Price, $10.00.

A Few Hints about Sound Castings and Factors of Safety.

So MANY disturbing elements intervene between the conception of a design in cast iron and the completion of the work in the building, that we all have to allow what we call a factor of safety (aptly characterized by the late Alexander L. Holly, C. E., as a factor of ignorance), to cover these contingencies, varying from three or one-third the breaking strain in very simple cases where the quality of the castings can be depended upon, to five or even ten where the design is more intricate or the liability to shrinkage strains, hidden defects in the castings, rough bearing surfaces or uncertain variations of the load are possible. Much can be done by designers of cast-iron work to reduce this factor of safety, and consequently the weight and cost of castings, by giving serious consideration to the many processes and changes of condition through which their designs pass on the road to the building.

Foundrymen exercise great ingenuity in producing any design in iron that may be presented to them; still it is possible to design things that are totally impracticable in cast iron, in which case the designer would probably be asked to modify his drawing; but when it is possible to carry out a design without change, it is the almost universal practice to do so without comment and without recollection of the fact that the resulting castings may have very serious shrinkage strains or other defects, which would reduce the strength far below what the designer expected. For instance, a column, say sixteen feet long, eight inches in diameter, three-quarter inch metal, is sometimes designed with a heavy projecting base moulding near the bottom, say twelve or fourteen inches in diameter, giving three inches or more thickness to the metal at that point, also having an extension of the shaft to pass down through a shell plinth or pedestal, while at the top there is a shell cap and then a shelf, say twelve by twenty-four inches, for girders, made, possibly, two and one-half or three inches thick, to insure strength without the use of brackets or ribs.

This, like all other architectural work, will be moulded in "green sand," which is moulding sand slightly dampened with water and rammed solidly around the wood pattern, forming a mould strong enough to withstand the wash and pressure of molten iron running into the mould. When we consider that iron weighs four hundred and fifty pounds per cubic foot, while water weighs only sixty-two and one-half, an idea may be formed of the strength of mould necessary to stand the wash and pressure, which, in a mould three feet high from the bottom of the casting to the top of the gate where the iron is poured in, is 1,440 pounds per square foot, nearly three-quarters of a ton on each square foot of surface; consequently the sand must be firm.

Now, realize that the pattern for this sixteen-foot column is made sixteen feet two inches long, to allow for shrinkage; also, remember that when this shrinkage occurs, something has got to give. The shaft of your column being only three-quarters of an inch thick, will solidify and commence to shrink, while the metal in your heavy base moulding and the shelf at the top is still fluid, and a little metal will run out into the body of the column as it draws away in cooling, leaving a little vacancy or depression in the upper part of the shelf or base. Presently these heavy parts will become about the consistency of cheese, but the shaft of the column keeps on cooling and getting shorter. Now the situation becomes serious. The soft metal in the base and shaft is not solid enough to allow the column to draw them bodily through the sand mould, so they stay where they are and the column shrinks away, stretching out more of the soft metal after it, making a weak place or leaving a nice little crack to be filled up with putty before the column is painted, and in an extreme case pulling away so much that the head will drop off when the column is hoisted out of the mould. Then the foundryman looks wisely at the column and says: "Now I will fix you," and puts a fillet around below the shelf, or a bracket, which will cool quickly and help pull, chipping out the bracket when the column is cold.

In case all these fail, he just lays in some cold pieces of pig iron before closing the mould, and they cool the heavy places off rapidly, and everything is lovely. This last makes the soundest job in the lot, as they all melt down together; still there is liable to be dirt on the surface and shrinkage strains that would not be there if the designer had made his metal in the shelf only one and one-quarter or one and one-half times as thick as the shaft, put in some strengthening ribs or brackets, and had also made his whole base shell, except a small bead or fillet, thereby justifying a smaller factor of safety and allowing all parts to cool at the same time. Mullion columns are often designed with a heavy square face cored out, which stands in front of the wood frames, while a thin web runs back between the sash weight boxes. This is an exceedingly hard shape to cast without shrinkage strains. The cored part in front only radiates heat from one side (the core being quickly heated through), while the webbed back runs away off towards the remote parts of the mould, giving off heat on both sides, and the extreme back edge radiates in all directions but one, thereby cooling much faster than the front part, so that when the back has attained its length for normal temperature the front is still red hot and much longer. When the front cools there results a strain, which gives this column all it can do to hang together until it gets into the building, without doing its full share of work after getting there. Moral: A good liberal factor of safety, or a nice large rib of metal, round or square, on the back of the web to keep it from cooling too fast.

The privilege of modifying the thickness of parts of castings to avoid shrinkage strains is one that a designer can safely give a foundryman, for it is always cheaper to make castings right than wrong to commence with. Still, any foundryman can call to mind numerous instances in which he has received serious rebuffs when he has volunteered advice which he considered good, to designers who did not care to hear it, consequently they are often backward about volunteering their opinions.

Unequal cooling and consequent crookedness of shell pilaster faces, frieze plates and light ornamental work is usually corrected by the foundryman without asking the designer's permission, as it is utterly impossible to get light work straight without providing for equal and uniform cooling. But in the manufacture of thicker pieces and parts intended to sustain loads of any kind, the foundryman never makes changes or asks permission to change, if he can possibly execute the work as per drawings received.

Generally speaking, a more intimate association between designers and executors of cast iron would result in a great saving of metal and a reduction of the factors of safety. Imperfect and unsound castings, owing to carelessness in the manufacturing, are much more rare than is generally supposed. Cold shuts from pouring the metal too cold; honey combs, dirt and scabs from soft or unclean moulds are quite rare, and never dangerous in the work of reputable foundries. Many more bad castings are made through an honest endeavor to carry out a design which is not positively the best thing possible for the place than from carelessness in the execution of the work.

Among the most noticeable indications of shrinkage strains in finished castings is crookedness. One side will be shorter, thereby giving the whole piece a crook, or in the case of wide plates they sometimes appear with the center perfectly straight and both edges "loose," or apparently too long for the center. The same may be said of the thin back ribs sometimes put on mullion columns. This comes from the apparently long parts cooling first, so that when the heavier parts cool afterwards the light parts are left too long for their places while the loss of strength incident to these causes is usually provided for by the enormous factors of safety used. Still, if designers would examine their castings carefully, they would soon be able to design forms not liable to these defects, and reduce their factors of safety accordingly.

Any foundryman will be only too glad to show designers of cast iron work, through his shops, and will be able to point out many important conditions affecting the success and quality of castings, which our space will not permit us to mention. We feel confident that as architects and designers of cast iron take a closer interest in the numerous processes of the foundry they will appreciate the fitness of and use cast iron more frequently.—*C. W. Trowbridge.*

Oliver Everett.

MANY of our readers will remember Oliver Everett, the Boston publisher, who did such an extensive business as a publisher in the early part of this century; the subject of this sketch is his grandson, and was born in Roxbury, Mass., on the first day of February, 1860.

In 1874, Mr. Everett moved to this city; here he became a member of the Lincoln School, graduating two years later, and immediately joined the High School.

Soon after his course of study was completed, he entered the office of Prosper Huerne as a student, remaining in that capacity for eight years. In 1883 he became a member of the firm of Huerne & Everett.

Mr. Everett may be said to be a Californian, for, although not born here, his education was acquired, and his architectural knowledge and experience gained in this city. He takes much interest in the meetings of the S. F. Chapter of Architects, and is one of its earnest members.

OLIVER EVERETT.

When to Advertise.

TO REAP in harvest-time you must first sow in spring, and the man who advertises only when times are good, does not receive half the benefit he would if he had invested in advertising six months previous to the influx of brisk times. If an advertisement is not heard from in six months, do not run away with the idea that the money paid for advertising is lost. If the medium is good, and the goods you offer are such as the people want, you will most assuredly get a good return for your money. If you advertise spasmodically, now here, and now there, you will get but poor return, but, if you get the proper medium—and this healthy and strong—your returns will be fully in keeping with your expenditure, and eminently satisfactory.

In "dull times" advertisements are scanned over more frequently than in the rush of a busy season. It is in "dull times" that nine out of every ten business changes are made, or plans matured for the coming season. In "dull times," too, it will be found that men are more readily impressed with the advantages which any new and lauded scheme may possess, because it is in pleasing contrast with their present unsatisfactory condition. The manufacturer who advertises largely through the "dull times" when his travelers are laid off, will find he has planted a crop at the right season, and his travelers, when they go forth for orders, will reap a rich harvest.

Nothing helps the traveler so much in getting orders as the fact that his goods have been well advertised in advance of his coming.

We say, advertise *all* the time; but if you must drop off, you had better do so in the busy season, for then your customers are buying from you constantly, and will know that you are alive and in the business; but if you pull in your advertisements when little or no business is being done, your customers are liable to believe that you are dead. At any rate, they will believe that you are not as much to the front as those who advertise their existence and desire to do business, and it is no secret that customers in all trades prefer dealing with a *live concern* rather than a dead one.

"Aciding" Files.

FOR the past two or three years there has been going on in New York and vicinity, and perhaps in other large places, a regular practice of buying old files—that is, files which have been worn out—and taking them to be, so to speak, rejuvenated. The process of doing this is to dip them in a very strong acid, which, while cleaning the file quite thoroughly, also eats away on the dull tooth to such an extent as to make it feel to the touch comparatively sharp. For serviceable work the file is practically useless; and we presume a number of our readers will be able to recall the time when a fair lot of files of a well-known brand was offered to them at a ridiculously low figure, and which they bought, thinking they had purchased a mine of wealth, and a few days after would have given just about as much as they paid for the files for a chance to meet the man who sold the goods.

We learn, on investigation, that the worn-out files in the shops of some of the large consumers are purchased by junk dealers, they paying 6½ cents a pound for the old files, which is just 5¾ cents more a pound than steel manufacturers will allow for the same files to be used as scrap and again worked into steel. To some of the large consumers of files it has been a subject of comment that such prices should be paid for this scrap, but when we consider the point that the junk dealers get at least a cent a pound more for them, we can readily see where the profit comes in to the junk dealer. As regards the parties buying at that price, they treat them to an acid bath, with perhaps a current of electricity sent through the acid to give it double strength, thereby producing a file which, though very black in appearance, appears to have a good tooth, and if it can be sold to the ordinary machinist or consumer, the venture pays pretty well. The party selling the files thinks he has made a handsome profit, and the consumer thinks he has got a bargain. As a rule, he is never called upon a second time, as the seller of the files would hardly consider it safe.—*American Machinist.*

Repairing Leaky Roofs in Rainy Weather.

CRACKS in the tin on a roof, or holes made by persons walking on the same, whose boots may have projecting nails in the heels, can be temporarily stopped by inserting over the broken place a piece of putty, upon which is placed a brick or some other weight. This is a simple and efficacious way to stop a leak during a heavy rain.

Another way is to cover the puncture with a cement made by thoroughly incorporating fine clean sand with white lead. Openings are easily filled with this mixture. Small openings require less sand than large ones.

Bound Volumes of 1884 Now Ready. Price, Post-paid, $2.50.

Hand Saws.

It is amusing to look over the saws belonging to a gang of carpenters. There is the big saw used by the little man, the little saw and big man; the good saw, the poor saw and the "horrid" saw. Some of them are enough to make a man feel tired just to look at them. One chap has a nicely filed saw, the teeth well shaped, a regular distance apart, and with just set enough to clear itself. Ask that chap why he files the teeth in just that shape and he will answer you that his "father learned him to." That is about all the reason he can give. Not one man in ten can tell why he shows partiality to a certain shape of tooth for certain work. The same man, when he buys a saw, is stuck again. He looks the saw all over, rubs his fingers over it, squints along the teeth, looks very wise, and asks to see another saw. When he chooses one, he cannot tell why he took that particular saw, or give any good reason for his choice.

When we buy a saw, we like a half dozen to choose from. Don't take a saw unless the back is ground thin. A polished saw is the best; it does not rust as quick, and it runs easier when the lumber is inclined to bind. Take a saw by the handle and see if it hangs well. It should not feel "top-heavy," that is, the point feeling out of balance with the rest of the saw. See that the handle fits your hand; if it does not, you never will like that saw, and will swap it off at a pawn shop for an old thing half worn out. See if the saw blade has a good bluish tint. If it looks like cast-iron, you had better leave it for somebody else. Hold it up by the handle and tap it with your knuckle; a good saw will give out a peculiar ring which poor steel never possesses. Hold firmly by the handle and switch it quickly from side to side and the blade will give out that "crackling" sound which once heard will always be recognized as belonging to a good saw. Don't take a thick saw. The thinner a blade having the requisite stiffness, the better the saw. Avoid by all means a flabby or limber blade; they are not worth carrying home, except to lend. Let the "borrowing chap" take it once and he never will ask you for another tool. Now hold the saw nearly level with your eye towards the light, and see if it is "wavy." If it is—drop it. Granddaddy's rule in choosing a saw was to "stick the point of the blade through the handle;" if it "came out straight," it was a good saw. Try this test if you wish; if the saw stands the test, all right, but you may spoil an otherwise good blade. This is an unreasonable test; a saw was never intended to double up like a hoop snake.

A high tempered saw is the best. This is why the blue tint is preferable instead of the cast-iron complexion. We pick for a hard saw every time. Manufacturers would make them harder if they dared to. Hard saw blades stay sharp longer than soft ones, and of course they are harder to file. Most of the boys won't buy a hard blade; they don't know how to set them without breaking out the teeth, so they say a hard blade is "no good" and swap it off. Half the carpenters set a saw at the bottom of the teeth; they set out the whole tooth, and we have seen the bend extending into the blade. This plays the mischief. If the saw is not very soft the tooth breaks out. If it does not break out, it strains the blade and makes it liable to break. Set only the points of teeth. For high tempered saws, the spring set is good, but we believe the "hammer set" is the only perfect set known. Morrills' "perfect" set is the set for the craft but when we set a saw for a delicate cut, let the saw be either hand, band or circular, we go to a little anvil with a corner beveled off; have a little cone to lay the saw upon, and fasten by a thumb nut when in the right position. You can now revolve the saw upon the cone, and set each tooth with a little hammer as in turn they pass over the beveled corner. This cone business of course applies only to circular saws; half the time we do not use the cone, but it is a "good thing for strangers." Strike a very light blow upon the end of the tooth; strike at an angle of sixty degrees with the saw, and always toward the center of the saw. We file the saw before setting; other methods require filing last, as setting dulls them. Strike just hard enough to upset the tooth slightly. In very hard saws, this is what prevents them from breaking. The tooth changing form ever so slightly, relieves itself from the severe strain caused by binding over the short corner of the anvil, and it "takes a set," as it were, at the same time, which prevents it from springing back a particle. When the teeth spring back as in case of spring set, their truth is greatly impaired. For a six-inch circular saw, having teeth three-eighths of an inch deep, we should not let them project over the corner of the anvil more than one-fourteenth of an inch.

Hand saws are no exception to the same rule, and work much better when the set is all in ends of the teeth. Sometimes we hear a man say that the set all works out of his saw. Just tell him to put the set where it belongs—in ends of the teeth, and it will stay where he puts it. Don't set a saw too much. It is waste of time, saw, and lumber. When you see a chap cutting up lumber with a saw, cutting a kerf one-eighth of an inch wide, you had better set him to work learning to file and set a saw. A sharp saw with ground back needs very little set. Eight out of ten users of saws can't file them. There is no other tool used by wood-workers which has such a fuss made over it in regard to being kept in order. Lots of men can put a saw in the clamps, rub a flat file over ends of the teeth, and then file them up sharp; but there their knowledge ends; they follow the shape of the teeth. If a tooth is bad shape it keeps that shape, only it gets "more so." The teeth get big on one side and small on the other. For a space they are huddled, then the next two inches seem to have lost a tooth. One side will be filed much more fleaming than the other side. No matter what saw it is, circular and band saws are not excepted, and all have to stand the same racket. Good files are few and so are good workmen. It is with a saw as it is with everything else; to be a good filer you must exercise care, and much care too. Good filers seem to take to it naturally. They don't know when they learned to file a saw; it seems as if they always knew how. Watch them closely and you will see that they are just as careful with the file as they are at the bench. They have their pet shape for the teeth of different saws, and they keep them that shape. They never "just touch up" a saw by going over it in a hurry and dubbing off the points of the teeth; when they file a saw, it is filed right. When they get a tooth to a point, they stop; they don't give another stroke with the file and take the point off, or round over the end of the tooth. When they get done, the saw is straight. Sight across points of the teeth and you can see them all. Now lay the saw flat upon a smooth board, take an oil stone and draw it the whole length of the saw upon the sides of the teeth; this will take off the feather-edge or burr from each tooth, and it then makes the saw cut nice and smooth. Be sure to rub the stone toward the handle; if rubbed the other way it is apt to bend the burr over without removing it.

It is impossible to convey without illustrations the exact shape for saw teeth. That there is a "best shape" everybody allows, but also all claim it as theirs. For cross-cutting file to an angle of sixty degrees "fleaming," and vary angle of back of the teeth with the hardness of the wood it is destined to cut. For very hard dry wood file back of tooth square across. For live or green lumber fleam back of the tooth just like the front. The teeth may also have a little pitch forward or be a little "hooking" for soft wood. Rip or splitting saws are not usually filed hooking enough. Many people file front of tooth perpendicular, the back at thirty degrees; hook the tooth five, or even ten, degrees more, and it will do much better work. File back of teeth square but fleam fronts a little. Where the same saw must be used for both hard and soft ripping, file front fleaming and back square. A compass saw is always a much abused article. Who ever saw one, unless just out of the shop, but what was badly bent, or else bent "clean in two"? Just take a compass saw and change the teeth all over. Make them hook toward the handle instead of toward the point. Set the saw nicely, file square back, and slightly fleaming front, and that saw won't bend up double the first time you try to saw with it. The Japanese seem to know a thing or two about saws and they make all theirs to cut when drawing towards them. Don't ever try to work with a dull saw. Just get into a barber's chair, let him shave one side of your face with a nice sharp razor, then let him open an oyster or two with it, and shave the other side—you will know all about sharp and dull razors and can apply the same knowledge to saws with perfect satisfaction. Take a hand saw that has been filed seventeen times without jointing, it goes jumping and rattling through the cut, gouging here and slipping there, till you wish the devil had it, yet a circular saw gets used in the same way, all the cutting done by three or four teeth, causing it to buckle, rattle in the cut, and, perhaps, catch, fly to pieces, and kill somebody. The learned coroner's jury will render a verdict of "death caused by disintegration of the steel composing the saw," and that will end the matter.—*Lumber World.*

Sending Logs down Nevada Mountains.

A chute is laid from the river's brink, up the steep mountain to the railroad, and while we are telling it, the monster logs are rushing, thundering, flying, leaping down the declivity. They come with the speed of a thunderbolt, and somewhat of its roar. A track of fire and smoke follow them—fire struck by their friction with the chute logs. They descend the seventeen hundred feet of the chute in fourteen seconds. In doing so, they drop seven hundred feet perpendicularly. They strike the deep water with a report that can be heard a mile distant. Logs fired from a cannon could scarcely have a greater velocity than they have at the foot of the chute. The average velocity is over one hundred feet a second throughout the entire distance, and at the instant they leap from the mouth their speed must be fully two hundred feet per second. A sugar-pine log sometimes weighs ten tons! What a missile! How the water is dashed into the air! Like a grand plume of diamonds and rainbows, the feathery spray is hurled to the height of a hundred feet. It forms the grandest fountain ever beheld. How the waters foam, and seethe, and dash against the shore! One log having spent its force by its mad plunge into the deep waters, has floated so as to be at right angles with the path of the descending monsters. The mouth of the chute is, perhaps, fifteen feet above the surface of the water. A huge log, hurled from the chute, cleaves the air and alights on the floating log. You know how a bullet glances, but can you imagine a saw-log glancing? The end strikes with a heavy shock, but glides quickly past for a short distance; then a crash like the reverberation of artillery, the falling log springs, vertically, into the air, and with a curve like a rocket falls into the water, a long distance from the log it struck.

Amyl Nitrite in Opium Poisoning.

According to *L'Union Medicale*, a patient who had taken two ounces of laudanum, who was in a comatose condition, with pulse beating only six times per minute, and upon whom belladonna and other remedies had produced no effect, was aroused by inhalations of amyl nitrite, and finally recovered.

Who Made the First Barrel.

Few inventions have had a wider or more varied usefulness than the barrel; few give such promise of perpetuity. Unique in principle, simple, yet singularly perfect in plan and structure, the barrel is a little less than a stroke of genius. Who set up the first one? Who first conceived the happy thought of making a vessel tight and strong out of strips of wood bound together with hoops? And when did he live?

No history of inventions; none of the encyclopedias in our great libraries; no historian of human progress, so far as we know, gives any information on the subject, unless we accept the Roman author, Pliny, who mistakenly attributes the invention to the Gauls who inhabited the banks of the Po. We say mistakenly, since there is the best of good reason for believing that the barrel was in use long before the Gauls took possession of their Italian home, perhaps long before the Gauls existed as a people.

The monuments of Egypt furnish proof of the early use of hooped vessels, though no date is given for their invention. In one of the inscriptions copied by Wilkinson may be seen two slaves emptying grain from a wooden vessel made with hoops, while a scribe keeps tally, and a sweeper stands by with a broom to sweep up the scattered kernels. Close by, an unfortunate is undergoing punishment by bastinado, for short measure, perhaps, or, as Mr. Wilkinson suggests, for petty theft. The measure is barrel shaped, and precisely like the *kayl* of modern Egypt. It would hold, apparently, about a peck. Unfortunately, the age of this inscription is not indicated. Measures of the sort would seem to have been in common use very early in Egypt, though not for the storing of liquids, for which purpose skin and earthen vessels were employed.

At first thought, Egypt would be the last place to look for the invention of hooped vessels, its arid climate making it specially unsuited for their employment. Possibly, however, that may have been the compelling cause of their invention.

Throughout the East, the bamboo is largely used for making hollow vessels, a section of the stem through a node securing a solid bottom, and one between the nodes an open mouth for a natural tub or bucket. In well wooded regions, nothing would be more natural than the employment of hollow tree trunks for the same purpose, or sections of tree stems, hollowed out by fire or otherwise. In drying, such vessels would split and spoil, and it would require no great genius to repair them by means of withes or wooden bands, the primitive form of the hoop.

If the users of such natural barrels should migrate to a region where timber was scarcer, economy of lumber would be likely to suggest the building of barrels from pieces artificially split; in short, the use of staves, by means of which the primitive cooper would be able to make several barrels out of a block that would suffice but for a single dug-out.

But this is speculation merely. It is enough to know for a certainty that the cooper's art, like the potter's, is one of extreme antiquity. We had no suspicion of its venerableness when we began to trace its history in response to the inquiry, Who made the first barrel?—*Scientific American.*

Truing a Grindstone.

Lay a flat iron bar across the grindstone frame as close to the stone as possible without touching. Take a piece of three-fourth gas pipe two or three feet long, and hold it about 45°, with the end resting upon the iron plate. Roll the pipe slowly across and against the face of the stone, holding the pipe firmly to its place, so that the stone will bite upon the end of the pipe. The pipe will wear away, as well as the stone; rolling it will keep the end even.

Salfeld School of Architecture.

Mr. David Salfeld has opened a school for the benefit of architectural students, at No. 700½ McAllister Street. Apprentices and those wishing to obtain a knowledge of architectural principles should consult Mr. Salfeld. Mondays and Thursdays are the days upon which the class meets. Full particulars given by calling at the above address.

Architectural Iron Work Manual.

We have received from C. W. Strobridge one of the most complete and finely illustrated manuals, descriptive of Architectural Iron Work, that has as yet appeared on our desk. The first fifty pages are illustrated with designs for columns, pilasters, etc. Following are tables of strength and deflection of I beams, and text relating to the use of angles and T's as struts. Most of the tables in this work are entirely new. These manuals are intended for free distribution to parties interested in any way in building, and a copy will be forwarded to any address by writing to C. W. Strobridge, Room 408, First National Bank, Chicago, Ill., and mentioning the name of this Journal.

The habit of "swearing off" at the beginning of the year is a time-honored one. The retail dealer should "swear" that he will look close to his credit; that he will keep his stock well assorted; that he will keep his yard in good order. The manufacturer should "swear" that he will go slow all along the line—in the woods, and in the mill; that he will keep well insured; that he will bear in mind every day that pine stumpage is not so plentiful in the Northwest that it should be disposed of for a song. The wholesale dealer is between two fires; he must do the best he can, therefore it will not avail him much if he swear at all.—*Northwestern Lumberman.*

Purchasing and Using a Grindstone.

A CORRESPONDENT of the *American Machinist* writes: "When you find a stone that looks about right, take a mallet or block of wood and strike upon it in several places. If there are any cracks and shakes in that stone, you can 'hear them.' Turn the stone over and examine the other side. With a cold chisel and hammer chip off a thin scale. It should break between your fingers, and almost crumble when rubbed rather hard. If it is hard and flinty, or has any trace of slate or soapstone qualities, give it the 'mitten.' The stone should be almost soft enough to enable you to pare it with the cold chisel, graver fashion.

"When you have got a stone to suit, have the sides turned off for flanges. All stones used to be wedged true upon a square shaft. It was a barbarous, unscientific practice. Dry pine wedges driven in tight, then wet thoroughly, the stone run too fast, is entitled to burst.

"Before you wet the new stone, put a dog on the end of the shaft, water on the stone, and a 'cub' on the dog. Let him turn the stone, and increase the speed until the water begins to fly off. It will commence to fly first at the point where gravity begins to assist centrifugal force, right where the stone begins to ravel *down* from a point level with the shaft. Count the revolutions, figure up the speed, and put on a pulley to make the stone run about this speed. A little faster will not do any harm; the stone soon wears, and the speed of the surface decreases. When the stone gets worn two or three inches, put on a smaller pulley. Keep changing until the stone is eighteen inches in diameter. Then turn a groove in the center of its face three inches deep. Fit a lot of dry pine wedges into this groove. Don't drive them too tight, or you may break off a big chunk of the stone. Now take the stone off and lay it down in the water, or where the pine wedges will get wet. Next we k you can go there and get two nice eighteen by four inch grindstones, just the thing for up-stairs, where you do the light work.

"Don't put a nasty water trough under your grindstone. It only serves to catch dirt, mud, and any tool you may happen to drop. Put a long shaft in your stone. Have the pulley three feet at least from the stone, and a bearing close to it. Cover this box with a piece of leather, and you can keep grit out of it. Put the other bearing close up to the stone on the other side. No use to oil this box. Might as well oil a water-wheel step. Make the bearing of bronze, and rig a one-fourth inch water pipe to discharge a stream upon it. Centrifugal force carries the water to face of the stone, just where you want it. The bearing is always lubricated, and the stone clean and ready for work. It will work, too. Use it well and it will be the best tool in the shop, except its formidable rival, the solid emery wheel."

Bound Volumes of 1884 Now Ready. Price, Post-paid, $2.50.

Stirrups for Supporting Centers.

MR. CHARLES ACKERSON has applied for a patent for a newly invented stirrup for supporting side-walk and similar centers of arches. By its use all studding and timbering is completely dispensed with, thus saving cost of the stirrups on a single job. Much time is also gained, as it takes but a few minutes to place them in position. Mr. Ackerson proposes to sell the stirrups at a cost of twenty cents each, or will rent the same for use at seven and one-half cents each. In the latter case, the time allowed is that occupied by actual use in the building for which they are rented. By referring to the large ad. elsewhere in this issue, a cut and full description of these stirrups will be seen, and any explanation in regard to the same may be obtained from the manufacturers, whose names will be found at the bottom of the ad.

NEW PUBLICATIONS.

Mechanic's Geometry, or the Science of Framing by the Aid of Card-board Models. New edition of 1885. With the aid of card-board models, and the rules and explanations given, the mechanic can readily learn the method of getting the length and bevels of every description of rafters, hoppers, etc. Stair work is also treated in a manner that at once arrests the attention of the student, and becomes an attractive study. This book will also be found useful, though possibly in a less degree, to those who have already become mechanics, but who have not learned the science involved in their trade. The main object of this work is the elevation of the working man to the dignity of the master mechanic. Price, Five Dollars.

The Artisan, or Practical Methods That May be Applied to Works of Building and Other Constructions. New edition of 1885. Among the practical ideas in this work will be found the utility of the right angle, and its application in solving many useful problems. By means of a right angle the exact circumference of a circle is determined at once. It also shows a simple and correct method for the measurement of boards, floors and other surfaces. It is applied to lines of any length, and divides them into equal parts. It gives the cuts and lengths of rafters, braces, and other timbers in framing. There can be no doubt as to the value of a right angle and its utility in this connection. It is clearly illustrated in the *framing square*, a tool which solves nearly every problem in practical geometry. Price, Five Dollars.

Science of Carpentry Made Easy. The work, *par excellence*, for every mechanic to have in his possession. It is thoroughly practical in its character, and contains much information to be found in any other publication. It excels in its methods of obtaining the length and bevels of every description of rafters, both common, hip, and valley. Price, $5.00.

Builder's Guide and Estimator's Price Book. This work is chiefly intended to assist the Builder and Contractor in making estimates of the cost of work they may be competing for. It is written by the author of the "Steel Square and its Uses," which fact is a guarantee that the book is practical in its character. Price, $2.00.

Detail Cottage and Constructive Architecture. To the general country mechanics, this work is invaluable. Every part of a building is thoroughly detailed, including store fixtures, counters, fences, etc. Price, $10.00.

Interiors and Interior Details. A large work, and as its name implies, contains details for every style of interior finish. The plates are all handsomely lithographed. Price, $7.50.

Hand Saws and the Art of Saw Filing. This book gives full information for putting in order all kinds of saws, from a carpenter's panel saw to a steam saw mill. Illustrated profusely. Price, $1.00.

Building Superintendence. A new work and one that should be in the hands of every architect, contractor, and student. Price, $4.00.

Practical Carpentry. As its name indicates, this work presents practical answers to those questions that so frequently vex the mechanic. Price, $1.00.

Carpenter and Joiner. This most excellent work, by Riddell, is well worth study by every one who desires to become proficient in the mechanic's trade. Price, $7.50.

NEVER fail to keep your appointments, or to be punctual to the minute.

Bound Volumes of 1884 Now Ready. Price, Post-paid, $2.50.

Our Exchanges.

WE have made arrangements with the Editors of the following Journals, by which we are enabled to offer quite a reduction to those subscribing for any one of them in connection with this Journal.

(The figures in parenthesis denote the price of the journals alone.)

Livermore Valley—Two one-story frames. O., Chauche & Rosquenaz; A., Huerne & Everett; C., W. B. Kreger; $7,175.

Modern Perspective. A perfectly new work. Should be studied by those who seek to excel. It is intended for the architect as well as the draughtsman. Price, $6.00.

Steel Square and Its Uses. Enlarged Edition. This work is just from the press, and those wanting copies should at once order them. It is a great improvement on the author's former work, containing much that is new to mechanics—some of the problems presented never having before appeared in print.

We are agents on this coast for this celebrated work, and will mail a copy to any address upon receipt of $1.00.

AN UNPRECEDENTED SHOWING.

Quarterly Review of Building Operations.—An Average of Nearly 100 Buildings per Month.

THERE are two classes of operators who have as yet failed to be convinced that we have, or are now passing through, a dull season,—those who buy and sell real estate, and those who perform labor and furnish materials for improvements on the same. Indeed, the latter class have had no cause for complaint for the past three years. The reason for this state of facts will be evident to those who make a study of the

BUILDING INTELLIGENCE

As published monthly in the columns of this Journal. The number and value of the improvements recorded for the first three months of the present year, exceeds by

OVER ONE MILLION DOLLARS

The record of any similar period that has come under our notice. This statement becomes the more noticeable when we consider that the first three months of the year are generally regarded as dull months, owing partly to our rainy season occurring in that period.

LOW PRICE OF BUILDING MATERIALS

Has undoubtedly been the cause of much of this activity; but we must look deeper beneath the surface if we wish to get at the true reason. A careful analysis of our building reports will show that the number of individual owners is on the increase, and this is owing, more than anything else, to the

LOW RATE OF INTEREST ALLOWED BY THE SAVINGS BANKS.

People of limited means have found that a more profitable investment awaits those who build houses for rent, and so we see numerous small houses being erected by this class.

It will be noticed that in a portion of the buildings quoted the name of an architect does not appear. This must not be construed to mean that no plans were drawn for the same. On the contrary, in many instances plans were prepared by an architect, but the owner superintended the erection of the buildings.

The following tabulated statement will show the result of three months' activity in the building interests.

FIRST QUARTER OF 1885.

	Frame.		Brick.		Alterations.		Total.	
Jan.	62	$247,320	2	$314,000	9	$41,265	73	$602,585
Feb.	103	492,500	6	131,725	12	36,172	121	660,397
Mar.	79	318,232	5	467,565	10	20,482	94	806,279
Total.	244	$1,058,052	13	$912,290	31	$97,919	288	$2,069,261

A total of 288 buildings of the value of $2,069,261.

For the same time in 1884 there were recorded 198 buildings of the value of $1,014,315.

As yet there is no decrease in architects' offices for orders of plans, etc., and we may reasonably expect that the balance of the year will witness an increased activity. Plans for several large buildings are now under consideration, principal among which is the Donahue Building on First Street, and two fine buildings on Market Street, after the pattern of the Levi Block.

RAISE IN THE PRICE OF BUILDING MATERIALS.

During the past month the price of lumber has been raised to $14.00 for rough, and $30.00 for surfaced. This we regard as too low; for while it may benefit a few in the large cities, it is hard on those working in the woods.

Hardware has still an upward tendency. Nails that a short time ago were sold as low as $2.45 per keg, are now worth $3.25. Locks and fine hardware have advanced 20 per cent. In fact, prices are firm for everything connected with building operations.

Scarcity of Draughtsmen.

THERE is, at present, an absolute dearth of first-class draughtsmen. We have "tracers and copyists" in abundance, but detail draughtsmen are scarce. We keep a list of disengaged draughtsmen, and, by forwarding your name to this office, the best means will be adopted to hear of situations. No charge for registration.

A Badly Used Owner.

WE clip the following from the S. F. *Chronicle* of 3d inst: "We are in receipt of a communication from a gentleman who is putting up houses in this city and who writes to complain that he is constantly being swindled by collusion between his contractor and his architect. He specifies that he contracted for a brick foundation which was to contain 8,000 bricks, but by running up the outside wall only one brick in thickness and filling in the center with sand, the contractor managed to put up the foundation with only 3,000 bricks. He contracted for flues from each fireplace and stove-hole, but the contractor only gave him one flue to four fireplaces. He contracted for A-1 first-class rustic work and got the commonest kind of sapped wood. His original plan contemplated a front elevation, with elaborate ornamental work, but after the building had begun the architect altered his plan without notice to the owner and the contractor gave him a plain front without any pretense at ornamentation. Altogether, he seems to have been an ill-used man.

"At Chicago and Kansas City when they want to describe a champion scoundrel, they say he is as great a rascal as a building contractor. The expression has become proverbial. We presume it is much the same here. There are, doubtless, honest men in the business, but there are a good many who only escape the penitentiary by superior knowledge of the law. The remedy for victims would

seem to be, find out the honest few and employ them only. It ought not to be very difficult to pick them out."

That the foregoing is false in part, is self-evident upon the face of the statement; if founded on fact, the results complained of were well deserved by the owner, as it seems that he was not a novice in house-building, and his former experiences should have qualified him to select an architect worthy of trust and confidence. The brick story, using three-eighths brick and five-eighths sand, is a farce. Eight thousand bricks would lay but a small extent of foundation wall at best. If it was provided that the walls should be thirteen inches, the width of three bricks, there would be the *extreme possibility* of facing up with brick on the two sides, and filling the center with sand, which, if practiced as an entirety in the full extent of the wall—a something that could not very well be done—the displacement of brick by the use of sand would amount to but *one*-third of the whole; but as the footing courses were likely extended full thickness, and the top covered with brick to hide the sand, about the worst that could be done would be one-fourth per cent. sand, instead of two-thirds per cent. Hence the silliness of the yarn.

But it is common in foundations of 8,000 brick in extent, to make the walls but nine inches. the width of two, or length of one brick, in which case a chamber for the deposit of any amount of sand would not exist. And the whole story in this particular would be a shallow brained misstatement. In either case, the brick matter is a high colored story.

If the architect did as is represented, the fact is clearly shown that he is, or should be, classed among the *architectural shysters* that disgrace the profession. Certain it is that no reputable architect would be guilty of any such nefarious work, and our contemporary is at fault in not ascertaining the names of the guilty parties, and publishing them in full; a course that this Journal would and will yet pursue, if the names are made known to us, and anything like the published statement shown up as facts. This is a duty we owe to the profession as a whole, and to its honorable members individually. It is also greatly at fault in giving publicity to an indiscriminate statement, calculated to impress upon the minds of the uninformed that architects, as a class, as well as contractors, are dishonest and tricky; all of which is grossly wrong, as there are many architects in this city, and contractors too, whose moral and business rectitude will stand the test of comparison with an equal number in any other profession, with no fear of shrinkage should the comparison be carried into the sanctum sanctorium of some newspaper publication.

If an owner, "the first time he builds," happens to be beguiled into a *scalper's* office, he is rather to be pitied than blamed, provided he has not drifted there in hunting up one of those precious frauds, a "cheap architect;" one willing to give his services (!) at any price that may be offered, relying upon after possibilities to "get even on the owner;" whether by substituting sand for brick, or any other villainous device practiced by those who are alike destitute of a proper knowledge of architectural science, and all principles of integrity and honor. And the fact, if fact it be, that "an owner" has been as badly used as the article under notice states, is not a sufficient reason why the whole profession of architects and contractors should be slurred and slandered.

OUR ILLUSTRATIONS.

A warehouse designed in San Francisco, to be erected in Baltimore, Md.; Wright & Sanders, Architects.

A California home; D. Salfeld, Architect.

On page 39 will be found the elevation of a five-story brick building, to be erected in Baltimore, Md., for A. B. McCreery. Both the owner and Messrs. Wright & Sanders, the architects, are inhabitants of this city, and it most certainly speaks volumes for our architectural talent, when an owner gives an order for plans for a building to be erected in a city of such prominence as Baltimore.

On page 41–47 are the plans, elevations, and details of a dwelling representing some of the latest phases of architecture as exemplified by a California architect. Credit for the same belongs to Mr. D. Salfeld, of the firm of Salfeld & John, architects. The happy combination of wood and brick as presented in the elevation, forms a pleasing contrast to the "rustic" fronts, so common in every portion of this slope. If good judgment is exercised in the selection of colors with which the woodwork is painted, and if judicious care is exercised in the planting of trees and shrubs around the house, a very pretty and comfortable home can be had by the adoption of the plan as shown.

By referring to the details, it will be noticed that the architect has shown the ends of the rafters with moulded projections worked on the timber itself, thus combining economy with beauty and solidity. All the different parts of the framed woodwork are to be morticed and tennoned together, except the intersection of the collar beams with the rafters. These are nailed as shown in engraving; the construction of the exterior is well shown in the various details.

The first floor plan possesses a few features not usually shown in country dwellings. The combination of the hall with the living and dining room by means of the sliding doors, and the direct communication between the parlor and dining room, makes the plan an attractive one, especially to those who are fond of much company. The toilet shown in entrance hall, the arrangement of the kitchen and pantries, the easy access to all the rooms from the rear hall, are features worth studying.

The rooms in the second story are amply provided with closets, windows and the other necessaries needed to make a comfortable home.

COST.

In the estimate of cost, the following prices of labor and materials are given, so that by comparing the same with the prices of corresponding items in various parts of the country a definite idea may be gained of the cost of the design shown; it must be borne in mind that prices are given as they rule at the time of the issue of this month's Journal; these of course are subject to various fluctuations.

Rough lumber (pine)	$14.00 per M
Flooring (pine)	$25.00 " "
Stepping (pine)	$35.00 " "
Rough lumber (redwood)	$16.00 " "
Surfaced (redwood)	$30.00 " "
Rustic (redwood)	$30.00 " "
Shingles	$2.00 " "
Laths	$3.75 " "
Brick	$9.00 " "
Lime	$1.50 per bbl.
Cement	$3.75 " "
Carpenters	$3.50 per day
Plumbers (with helper)	$6.00 " "
Plasterers	$3.50 " "
Masons	$4.00 " "
Laborers	$2.00 " "
Lathers	$3.50 " "
Painters	$3.50 " "
White lead	6½ cts. per lb.
Boiled oil	70 " " gal.
Plastering	28 " " yd.

The above includes about all items necessary to arrive at a definite conclusion in regard to the cost; $7,000 will be required to finish the dwelling as per plans shown; that is, according to rates as published above.

There Should Be Work for All.

A GENERAL reduction in the hours of labor throughout the country would give constant employment to all, whereas, at present, hundreds of thousands are compelled to walk the streets or tramp through the country in the vain pursuit of work. Monopoly is frank enough to say that too much has been produced, and that it must unload before the wheels of productive machinery are again set in motion. When it answers the purpose of capital as at present to reduce the hours, how readily workingmen accept the situation. Wages for a season would be a trifle under that paid for more hours, but the compensating demand for labor would soon bring the pay up to the standard of present rates.

Very little intellectual improvement will take place among our working people while all their vital energies are exhausted by the continuous strain which over long hours of routine toil exact.

DESIGN OF WAREHOUSE FOR A. B. MCCREERY. TO BE ERECTED IN BALTIMORE. DESIGNED BY WRIGHT & SANDERS, SAN FRANCISCO.

"Fire Limit Ordinance" vs. "Building Laws."

As at present manipulated, fire ordinances and the building laws of San Francisco are mixed up as one, with the board of fire wardens, the chief engineer of the fire department, his aids and deputies, and others within the fire department circle, as the sole exponents and executors of said laws and ordinances.

While there is a co-relationship between the practical results of the architectural and building sciences, and the study and knowledge of security from the destructive element, - fire; safety to those who so often imperil their lives combatting the fury of devouring flames, there is a difference between the two so vast and emphatic that the laws and ordinances regulating and defining limits and procedures, should be distinct and separate to each, and respectively,—placed under the control of men qualified by education, contacts and experiences, to understand, manage, and determine all issues and necessities in each department respectively.

The standard of intelligence and experience that perfects a thorough knowledge of things "combustible," "inflammable," "explosive," etc., and qualifies for all the duties and understandings necessary to, and involved in connection with a well regulated fire department, as a rule, and generally, is entitled to but little consideration in architectural and building matters. There is but incidental assimilation of thought and study, and when mixed up under one control and dictation, discordancies are inevitable. Hence the necessity of

A "BOARD OF PUBLIC WORKS"

Composed of intelligent, competent and qualified men, capable of understanding and determining not only all principles of strength and safety in the construction of buildings, but all other matters of sanitary and other material import, which should be under legal control and regulation. As now regulated, the conglomerate fire and building ordinances contain many provisions which should be illuminated, for the reasons that they are unnecessary and more than reasonably restrictive; many of them are "dead letters" seldom observed, yet ever at command when for reasons their enforcement may serve purposes.

We do not mean by this article to impune the motives, or question the integrity of those managing matters as now regulated, but to call attention to the error which manifestedly exists in the combination of laws and ordinances as they are at present. A "board of public works," we hold, is a necessity in this city, and should exist, with full jurisdiction over all questions and matters involving the building interests. In very many of our Eastern cities, such boards perform the duties suggested, to great public advantage, and without conflict or disagreement with the fire department regulations,—the two managing their affairs separately, yet in harmony, as far as the interests of either are concerned; and so it should be in San Francisco.

Shoddily Built Houses.

They are numerous in San Francisco, mainly because they suit a large number of owners who prefer them to well and properly built houses, not upon the score of shoddiness, but because they are "cheap"—*cheap* as to *first cost*, quality being an unconsidered factor in the matter. It is simply strange how so many otherwise intelligent men and women can be persuaded to accept the bad, as good, inferior as excellent and satisfactory, upon the catch penny idea of cheapness. Almost every owner, in making first statements to an architect, premises by saying that they want a house "well built, strong, and with all modern improvements," and in a majority of cases, if the man of plans states the actual facts of cost for the house outlined, the owner is discouraged, and withdraws to seek another who will promise more at less cost.

In this way a class of disreputable men have met encouragement, and make pretense to architectural skill, while, in fact, mere *shoddyists* in both architectural and constructive senses. Yet people like this degeneracy in house construction so well that thousands have mere shells for houses, with so many manifest defects that the pleasures of ownership are greatly compromised, and sometimes rendered so unpleasant and unbearable that escape is sought by *"this property for sale,"*—reasons not mentioned.

Pressure per Square Inch.—Bricks intended for substantial buildings should stand a pressure of not less than 6,000 pounds per square inch. For public buildings, where the brick will necessarily have to bear a great weight, they should stand a pressure of not less than 7,000 pounds per square inch. Government contracts are often awarded to parties manufacturing brick that withstand a pressure of from 8,000 to 10,000 pounds per square inch.

Most people think an iron mast is cast and solid, and wonder why its weight doesn't pull it up by the roots, or punch a hole in the bottom and slide through. This shows how easy it is to be mistaken, says an exchange. An iron mast is really lighter than a wooden one. A 60 foot stick of spruce or yellow pine, 2 feet in diameter at the base, weighs far more than the shell forming the modern iron steamship masts. These masts for the *Atlanta* will be fine specimens of their kind. The mainmast is 2 feet in diameter at the base, tapering to 17 inches at the top, at which point the funnel will be fashioned square, making a marked distinction from foreign-made masts-heads, which are left round. The mainmast is 68 feet 4½ inches in length, and the foremast 2 inches shorter. The method of construction is peculiar. Three T shaped rods of steel, the length of the masts to be made, are affixed, base outward in circular wooden frames, and around the skeleton thus formed the ready shaped plates are riveted in place. The plates are 12 feet in length and about ⅜ of an inch in thickness.

Building Improvements in Woodland.

Woodland, March 4, 1885.

To the editor of the "San Francisco Architect and Building News:" The following is a synopsis of the building and improvements of Woodland and vicinity for the first three months of 1885, ending with March 4th. So far the building interest has exceeded our expectations, and surpassed in amount of capital any previous quarter.

In connection with the steady demand for new buildings and extremely low price of lumber and builder's hardware, many have been induced to start in and take advantage of the favorable times, and we can safely say that business is good.

Carpenters and joiners are hurried, brick layers and plasterers are rushed, painters and paper-hangers are busy, while material men are perfectly happy, and the consumer reaps the benefit. Under such circumstances who should object.

The number of buildings and improvements of all classes is:—

CITY.

	COST.
13 Frame Buildings	$18,800
4 Brick Buildings	38,400
11 Improvements and Alterations	14,800
Total number, 28 buildings; total cost	$72 000

COUNTY.

	COST.
9 Frame Buildings	$12,400
5 Brick Buildings	10,100
2 Stone	8,000
Total number, 16 buildings; total cost	$30,500
Final aggregate, city and county, 44 buildings	$102,500
" " for 1884, 27 buildings	56,050
Increase over corresponding three months of 1884	$46,450

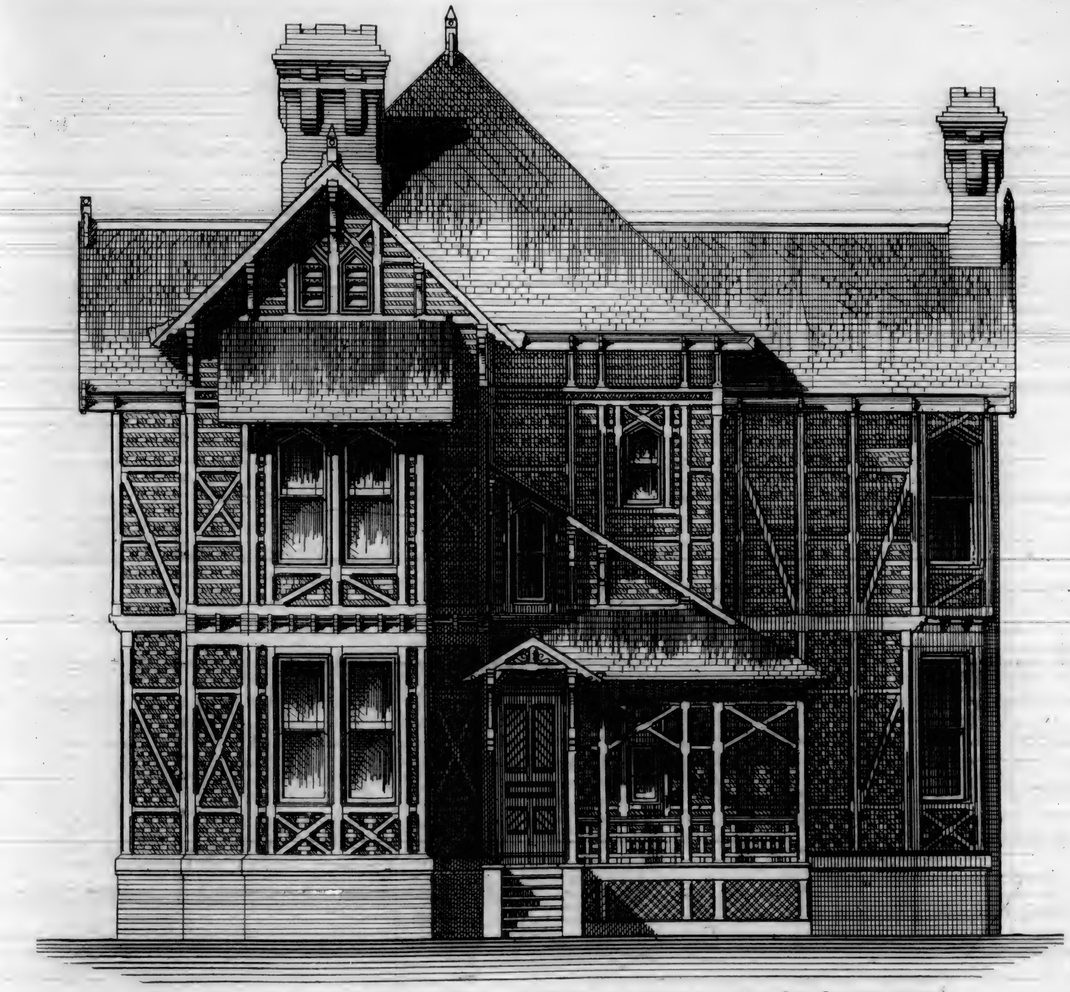
It is gratifying to note that the class of buildings about completed and those under construction, so far this year, are of a better grade than heretofore, and a larger number have employed the services of architects and draughtsmen; last year the average was about one to three and one-half, this year it is one to two and one-half. This is evidence of a higher standard of excellence being adopted by our building community. Let us give more earnest thought to the architectural planning and improvement of our buildings and homes, and surely whatever effort we make in tasteful ornamentation will be an advantage to ourselves and impart a useful example for others to emulate, and as we journey through life let us leave pleasing land-marks by the wayside.

Accept our thanks for past favors and courtesies. Respectfully yours, G. and S.

Garland Traps.

These traps are constantly asserting their superiority over all others now in use. The great evil of "back water," is absolutely overcome by the simple action of the indestructible glass ball valve; this is the only trap with a valve of this description. Address, 1901 Broadway, Oakland, for circulars, and notice the adv. in this Journal.

Bound Volumes of this Journal Now Ready. Price Post-paid, $2.50.



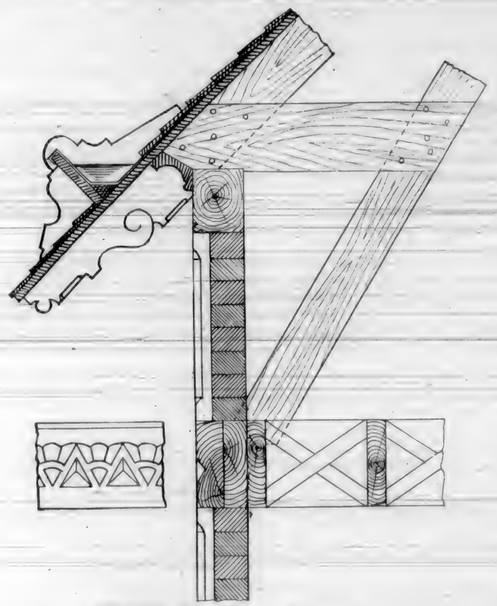
Front Elevation of a California Home.—D. Salfeld, Architect. (See Our Illustrations.)

Wasted Heat

It is a common notion among dwellers in cold climates that, in order to keep warm, we have only to make our houses air-tight, without regard to the texture of the materials of which the walls are composed. We read of the poor Esquimaux in their snow-walled huts, and shed tears enough over their pitiful condition to go far toward turning their frozen habitations into pools of salt water. But our sympathy in that direction is wasted. Walls of snow lined with white bear skins, or even with greasy blankets, are a stronger barrier against cold than plate glass windows, however they may be fortified with putty and rubber weather strips, that is, in very cold weather. Or to speak with more scientific accuracy, they will prevent the escape of heat far more effectually, which is the main point; it is not the entrance of cold against which we are to guard, but the exit of the heat. If, instead of glass, we were to use thick cakes of ice in our windows, they might not be quite so transparent, but they would be just as warm as frost-covered glass, and decidedly warmer than the glass when the wind blows and the weather is extremely cold. Woolen blankets would be vastly better than either, and common cotton cloth is almost as good, as every builder knows who has tried the experiment of keeping a house warm for plastering in cold weather before the windows are put in.

Everybody knows, too, that double windows make a house warmer, but all are not aware that this is not because they prevent the cold air from blowing in around the sashes, but because the confined stratum of air between the two thicknesses of glass prevents the heat from passing out of doors through the glass, as it would do freely if there were but one thickness, or if the two were in actual contact. It is not always remembered either, that for this purpose a curtain of any sort, even of paper, fitting closely against the window opening will have, when closed, a similar effect.

One thing more while we are upon this subject. Exchanging the warm atmosphere of our houses for the cold, out-door air, through



SECTION OF MAIN EAVES

the cracks around the windows and the invisible or unnoticed cracks and pores in the walls, is not altogether a poor exchange, for the air that we get is of far better quality than that which we lose, if of inferior temperature. But the heat that goes through the window panes is absolutely wasted, leaving the air which has parted with it to fall to the floor, keeping all its impurities still in the room.—*The Builder.*

English Law on Boundaries of Property.

MUCH has been said during the session of our late Legislature, in regard to the boundaries of property. English Law has been referred to in many instances, and in order that our readers may properly understand some of the laws referred to, we present a few that may be of interest:—

"In the absence of plans, figures, or rebutting circumstances, where a fence or hedge and a ditch are conjoined, the landowner on whose side either of the former stands, claims the latter; the theory being that excavated soil was cast on the digger's land as groundwork for his barrier, which thus with the ditch forms the boundary, and the limit being the outer bank from the fence or hedge. Property in a fence or hedge between ditches or without ditch may be joint, or rest on acts of ownership of long standing, as executing repairs, especially on demand.

"Posts and rails of paling are presumed to stand wholly on the owner's land, with pales outward and nails driven *home*.

"Joint proprietors of fences, etc., are not necessarily under obligation one toward another to preserve them, any more than a sole proprietor is similarly bound toward the adjoining owner or the public; but in both cases prudent precautions must be taken to obviate injury to others, as by scouring ditches, inclosing holes next to public roads, preventing cattle straying, etc. Generally, the tenant (who must also usually preserve boundaries), not the landlord, is liable to actions in such cases. The time a fence has existed is one element in considering liability to repair it; and twenty years is the least period.

"Where a stream flows between properties, the presumptive boundary is the central line of water, use of which is shared between opposite owners, neither being entitled to injuriously affect the other or proprietors above or below by obstructing, diverting, diminishing, or polluting it.

"In the case of houses or grounds separated by walls used by both owners and built at joint expense, half on the land of each, and also where it is unknown at whose cost or on whose land such walls were erected, they are practically common to the parties, and either may exercise acts of ownership in building, etc., so that one does not prejudice the other. If a man builds on another's ground, the latter must set up his right within a reasonable period from cognizance of the trespass.

"At common law, a man has a right of natural support of soil, so that an adjoining owner must not by excavating cause it to fall. If a house has been erected above twenty years, there is usually a special easement of support from adjoining land or houses (as from party structures), the proprietor of which is liable for injury by settlement, etc., caused by him. In other cases general right to support or to notice to take precautions should be proved. Where a row of houses is built by one owner and sold to different parties, there is by implication right to joint support."

A CARD.

A Book called "Industry of California" represents me in its pages as one of the Architects of the State Capitol at Sacramento.

Permit me to say through the "California Architect, that credit for the design of the building mentioned properly belongs to Reuben Clark (now deceased) assisted by Mr. Kenitzer.

I was, however, associated with the latter named gentleman during the construction of the dome and many other important parts of the building, until near its completion.

Neither did I in any way have anything to do with the Baldwin Hotel.

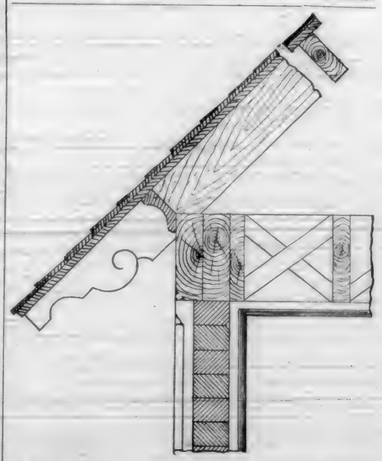
Respectfully,
A. A. Bennett, Architect,
431 California Street.

San Francisco, March 10, 1885.

(This correction was published in the "*Examiner*" of September 13, 1884.)

How Bricks Are Handled in Germany.

THERE are no hod-carriers in Germany. Bricks are passed from hand to hand. The higher up the bricklayers are, the more men are required to toss the bricks Two men to a story is about the average, with enough more to lead from the front of the building to the place where the bricks are needed. One may sometimes see three men on the ground, eight on the front of the building, and five on the top, making sixteen men through whose hands each brick passed before it reached its place of destination.



SECTION OF BAYWINDOW EAVES

Written especially for this Journal.]

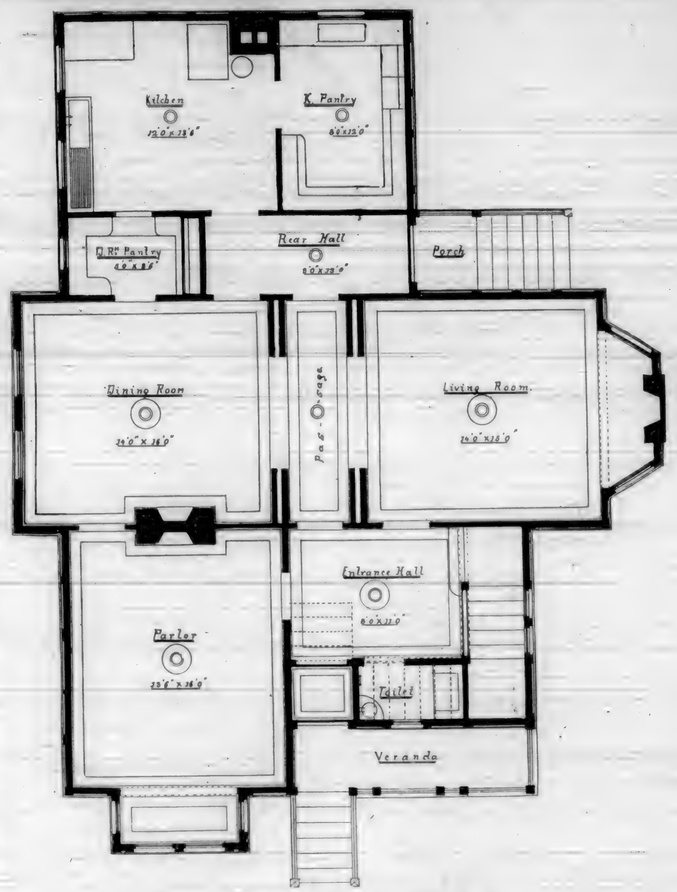
Nature's Lines of Beauty.

PEOPLE whom we have had the pleasure to meet during our occasional visits abroad, have repeatedly expressed their wonderment at the architectural lines of beauty displayed among the ruins of temples, pyramids, and the like, so often seen in Egypt and elsewhere, mentally asking why America, in her massive structures, fails to produce counterparts in this respect alone. Though we, as a nation, are experts in ornamentation and finish, still, when a large structure is completed here and admirers examine, there seems to be something lacking to give it that well proportioned look so characteristic of those preserved temples abroad.

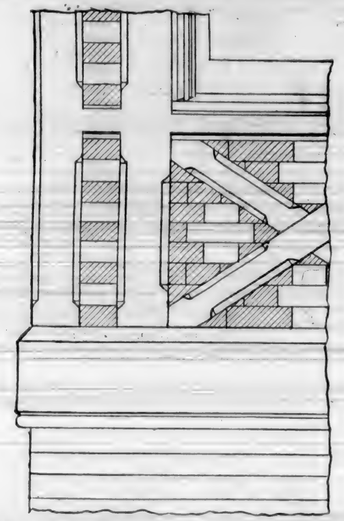
This something, though perhaps indefinable, is something nevertheless, and should we call into requisition the best architect he would be at a loss to define it; the geometrician, however, would state in an instant that in carrying out his plans, the architect had deviated from a rule that governs all things terrestrial, namely, that of the circle, this planet itself being circular in form, and nearly every one of its natural productions partake, to a greater or less degree. Any deviation from it in the arts is, technically speaking, to distort nature. The objective of the eye itself makes everything assume the rounded edge, and these sharp corners and obtuse angles are inconsistencies not to be received by this organ without recoil. All have noticed how an oval cornice, to relieve the junctures of a perpendicular and horizontal surface, mellows the sharpness and enhances the appearance of the space surrounding. A little round corner is the cosiest one of the room, and right angles make them cheerless and cold. In furniture, all æsthetic minds love the graceful curve; in painting every touch of the artist is to mellow the dark corner and round the angles. Even in the human form divine, how square features do mar our ideas of beauty and loveliness; though we educate the sense of sight to admire these lines of beauty and graceful curves, we blunt this the same by placing obtuse and triangles in the field of vision. Everything is built on the square, excepting, perhaps, the formation of character, while the organs of sight are constructed particularly with a view of comprehending circles and curves.

If we examine any of these ancient temples and palaces, we will find them all constructed in accordance with the shape prescribed by nature. The floors and ceilings, walls and copings, the exterior and interior, show the unmistakable signs of circles and curves. Should we care to prove the correctness of this, place the eye on a level with the water of an inland lake or pond, and the center will be found the highest part; do the same with the floor of one of those old-time structures abroad and the same results are apparent, viz., the middle is the highest in proportion to the size of the room, and even the most retired, narrow courts, secluded sanctuaries, and secret closets are all constructed in the same accord. Go out and view the horizon; above, a beautiful, regular dome will appear; do the same with one of their temples, and the center is a dome however small or flat, still circular in form, highest in the center; hence the massive appearance of those rooms, which, were the order of things reversed, would appear smaller in proportion to the size of the circle described. This rule is apparent everywhere in the construction of those buildings. A study of this system of architecture demonstrates many of the characteristics and perfections of a strange people who have left no clue to their origin or supposed destiny, but left these relics of grandeur that will live for all time.

Careful measurements and computation of these rooms and the arcs represented in all their architecture illustrates freely that their knowledge of the earth's shape was the same and equal to ours of this important age; and further, that their knowledge of and ability to incorporate natural appearances with architectural effects, was even superior to ours. It may be that their knowledge of optics and optical effects surpassed ours, but in any event they obeyed nature in their artistic achievements, with results that American artisans need not feel at all humbled to copy; and if they could all see the two effects in a building, they would do so without an invitation. Place a piece of canvas on the ceiling of any room; allow it to bag in the center but an inch; now note carefully how the room appears, its size and general fitness now change; and elevate the center of the canvas and again note the general character of the room, and, notwithstanding the fact that a circle has not been made, only a distorted semblance, no one who will take the trouble to perform the foregoing experiment would be willing to admit that his eye could be improved upon to this extent. Every inch of circle seems to make a foot in the height of the room, and the same rule



FIRST FLOOR PLAN OF A CALIFORNIA HOME.



Outside Elevation of Base & Windowsill.

holds true regarding the walls and corners, and the illusion increases in proportion to the perfectness and size of the circle.

Again, whether this people were aware of it or not, they made one of the best applications of the law governing stability known, for by their system of construction the building is braced from every point, no stress being imposed directly on any single point, but from the very foundation up every stone was made to sustain some portion of the weight of the entire structure, even to the ornamental work of the walls and crevices of the interior.

Placard Benisons.

We sometimes see at the doorstep of some house the word "Welcome" imbedded in the rock or on a foot-mat. It is pleasant to be so cordially and promptly invited within, but we must divide this gushing hospitality with the merest wayfarer, the peddler, and the tramp. If it were thrown down just once and for us only, what a different train of thought it would suggest! But a hospitality so broad overleaps itself and loses its subtle and most cherished fragrance, for the truth is, neither love, friendship, nor religion can be profited by tricks or by rude publicity. Their graces and benedictions, their benisons and benefits, come with silence and secrecy.

Bancroft's Histories.

This magnificent work embraces a complete history of the Pacific States. The territory covered is the western half of North America, from Panama to Alaska, including all of Central America and Mexico, and is equivalent in area to one-twelfth of the earth's surface. There are to be thirty-nine volumes, with maps and illustrations, fifteen of which are now ready. They will be well printed on good paper, neatly and substantially bound, uniform in style, and will average over 700 pages each. Three or four new volumes per annum will appear until the entire series is completed. Subscribers will not be obliged to take the work unless it corresponds with the description in every particular.

	Per Volume.
Bound in Extra English Cloth, neat and attractive style	$4 50
Bound in fine leather, Library Style	5 50
Bound in half calf, half Russia, or half Morocco	8 00
Bound in Russia Leather or Tree Calf	10 00

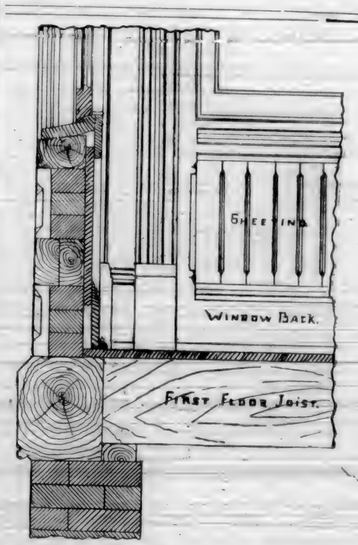
Any information in regard to the above will be given by addressing the office of this Journal.

Concrete Walks.

An engineer tells how to make a cement or concrete walk requiring no great skill in preparing materials. These are water, lime, and gravel or ashes, or both. The gravel and ashes are put in a heap and wetted. One barrel of the waterlime is mixed with sharp, clean sand, dry, being shoveled over back and forth several times to get a thorough mixture. A portion is then mixed with water into a thin, soft mortar, and five parts of the wet gravel or ashes are well mixed with it, so that every fragment is coated with the combining mortar. This is important for obvious reasons. The concrete is spread on the graded walk and beaten down with a rammer until the moisture gathers on the surface; some of the dry sand or cement is then scattered over the surface to absorb the moisture, and the surface is smoothed over with a plank rubber having a sloping handle to work it back and forth. In a few days this is hard, and it becomes harder with time. By making divisions of thin strips of wood or tarred paper the cement may be laid down in blocks, squares, or diamond-shaped, and for extra good walks the blocks may be colored by mixing the finishing coat with brown or gray, or other colors, alternately.

The Safest Part of a Car.

It was well said by the conductor, who, when asked what was the safest part of a car, replied, "That part which happens to be in the shop at the time of the accident." It is a popular superstition that the center of the car is not only the safest part, but is also much the easiest riding. One of the greatest trials of a Pullman conductor's life is the fact that about every passenger asks for a lower center berth the first thing, and is frequently indignant because it cannot be had. If the center of a car rides any easier than the end, then our cars, built as solid and as strong as they are, spring up and down in the middle precisely as does a buckboard. If they do not, why should it ride any easier? As for safety, if you are in the rear of the last car on the train, and another train runs into the rear, you are liable to get hurt. In all other accidents you can conjure up as liable to occur, it is the safest. If a head collision, there is nothing back of you to add force to the blow. If the car leaves the track and collides with a bridge or any obstruction on a side track, it will not be in your end. If the train is thrown down an embankment there is nothing to land on top of you. Then, this location is the most pleasant. From it you can watch all the movements of your fellow passengers, often a good way of passing the hours of a long and tedious journey. If your eye happens to catch a particularly fine view, you can, by turning in your seat, or stepping to the door, take it all in. If there is a safest part of a train, it is in the last seat in the last car.



Section of Base & Windowsill.

Pacific Coast Nail Trade.

Somebody has asked, "What has become of all the pins?" With equal propriety it might be asked what becomes of all the nails. A nail is often a handy thing to have round the house, but it is not so handy to find one if there be any boys about the house. A good housewife says a boy's pocket is the best place to look for nails. It is not certain whether nails attract boys or boys attract nails. The two objects are sure to come together and remain fast friends until a hammer can be found, and then there is an eternal separation, but the nail is found to be just as fast a friend as ever. Less than a century ago, all nails were hand made. Now there are 80 nail factories in the United States running over 6,000 machines, with a capacity, if all were steadily employed, of over 12,000,000 kegs per annum. The largest amount produced that we can recall was 6,147,000 kegs of 100 lbs. each in 1882

Nails are made in some 17 States of the Union. Among the latest States to enter upon this industry are Wisconsin and California. The latter entered upon nail making in January, 1883, with 50 machines.

Up to within the past two years, all the nails used on this coast were imported from the East. The imports at San Francisco, in round numbers, for the past twenty-two years, have been as follows:—

1863, kegs	95,000	1874, kegs	215,700
1864	94,400	1875	232,100
1865	70,300	1876	181,900
1866	103,100	1877	218,000
1867	190,800	1878	223,000
1868	158,200	1879	162,000
1869	176,600	1880	192,500
1870	103,900	1881	259,300
1871	150,200	1882	200,700
1872	225,000	1883	178,200
1873	129,000	1884	101,700
Total, 22 years			3,651,300

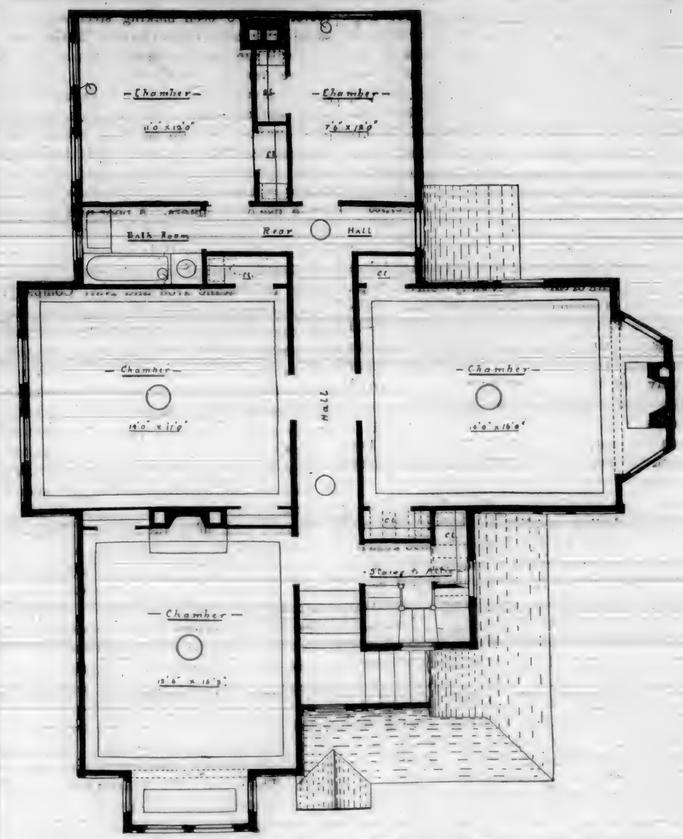
Dividing this period into two equal parts, we find the imports for each to have been as follows:—

1863 to 1873, kegs	1,490,500
1874 to 1884	2,161,800
Totals	3,651,300

The imports for the last eleven years show an increase of 45 per cent. over the first eleven years. The real increase has been larger, because some of the principal cities in the interior, which formerly drew all their supplies of this character from San Francisco, have been importing considerable quantities direct from the East in the last few years. These consignments are dropped off the cars at Sacramento, Marysville, Stockton, San Jose and Los Angeles, and of course no longer figure in the imports at San Francisco. While there was only 101,700 kegs Eastern nails landed at San Francisco in 1884, the total supplies which reached California from the East in that year are estimated at 134,000 kegs, showing that over 30,000 kegs were dropped off at terminal points in the interior.

Prices, brands and means of transportation have undergone great changes during the above period. In the early days of San Francisco nails were very valuable, and many sharp corners were made to the profit of the holding interest. The year 1865 was also a speculative one in this branch of trade. In January, 1865, prices were from $4.50 to $4.75. In February, the outside rate was put up to $5.50, but immediately afterwards, under fresh arrivals, rates went down to $4.37½ to $4.50. These were the lowest figures that year. In April, $5.50 was paid and in May, $5.75. From June to October, the market rated at $6.00 to $6.50. In November the price was advanced to $6.75 and in December to $7.00. In January, 1866, the New York currency price was $8.00, and the freight by sail out was $1.50 in currency. This made the price equal here to $7.00 per keg in gold. Some lots were sold at about that time at $7.25 from ship, while jobbers were generally asking $9.00@$10. These are the highest figures we can recall in the past quarter of a century. From $4.50 in 1869, prices rose to $5.50 in 1870 and $6.00 in 1871. Since the last named year rates have never been as high as $6.00, with the exception of 1880, though they have frequently reached $5.00 and upwards. In 1878 they fell as low as $2.75, which, up to that time, was said to be the lowest figure reached. That was a very unsatisfactory year to importers, who failed to realize cost and freight on some of the lots sold. In 1879, there were sales as low as $2.00 but the price advanced to $5.00 before the end of the year. Prices were also low in 1883, the average being $2.40 to $3.40. They sold as low as $2.75 in 1884.

The favorite Eastern brands have been Boonton, Oxford, Old Colony and Fall River. In 1876 other brands came upon the market. Notably among these were some consignments from the Riverside Iron Works at Wheeling, West Virginia. This factory sent us 20,000 kegs that year, which sold at $3.20 to $3.50. Some of these were said to be peculiarly adapted to Pacific Coast woods. In 1881 some more new brands were received from Pennsylvania and Ohio factories. Reduced overland freights were the inducement at that time. Prior to 1870, all our nails came by sailing ships. Nearly every ship leaving New York or Boston for this port would have consignments of this character, seldom less than 1,000



Second Floor Plan of a California Home.

kegs, and sometimes as much as 7,000 kegs. Soon afterwards, the reduction in freight by the Panama steamers, brought about by the opening of through rail connection with New York, made it possible to ship these goods by way of Panama. Since 1874, the railroad has also been availed of to bring consignments. The imports for that year reached San Francisco by the following means of transportation:

Per ship, kegs	153,900
Per steamer	57,700
Per railroad	4,100
Total	215,700

The steamers and the cars have since taken the great bulk of this freight away from the ships. It is a common occurrence of late years for the Panama steamers to bring us 3,000 kegs on a single trip. But there are only two steamers per month. Freight trains arrive daily from the East, both by the Northern and Southern routes, and scarcely a train comes into the borders of California without some consignments of this kind. At least this has been the case up to the opening of the year 1885.

The estimated consumption of San Francisco, including supplies sent inland, has varied from 85,000 kegs in 1865 to 259,000 kegs in 1883. These figures show a monthly consumption varying from 7,500 kegs to 21,600 kegs. Our dealers have been accustomed to carrying a stock of 6,000 to 60,000 kegs. Now that supplies are obtainable at our doors, the hardware men allow the manufacturers to carry the burden of stock. It will probably be a long time before we cut entirely loose from Eastern supplies of this nature, though we are informed that the local factory has sufficient capacity to meet all the demands of the coast. This factory is located at Oakland, and was erected in the closing months of 1882. It is supplied with the latest improved machinery. The building is two stories high, and the machines are placed in the second story, the nails dropping through apertures in the floor to reservoirs on the first floor.

A rolling-mill is attached to the works, so that the iron is prepared and all the operations completed at the same point. The factory has a fine water frontage, and the first cargo of 500 tons iron came alongside the company's wharf in January, 1883. There is also rail connection direct from the factory with all parts of the country. The factory has encountered the usual obstacles incident to the introduction of manufacturing enterprises in this State. There have been two or three strikes among the workmen concerning wages. But everything is now running smoothly. The factory made about 100,000 kegs in 1883, and 129,332 kegs in 1884. At the close of 1884, the factory held a stock of 21,561 kegs. The managers expect to make 200,000 kegs in 1885, and claim that the factory has a capacity for 300,000 kegs. Despite this outlook from the local factory standpoint, it is probable that at least 100,000 kegs will be received here from the East this year.

Within the past two years some of the factories have been making steel nails and tacks with more or less success, but whether steel will run out iron in this line of manufactures remains to be seen. It is to be regretted that some of the iron nails sold in this market in the past year have been of very poor quality. We do not know where they were made, but have seen them bend and break rather than enter the wood in which they were being driven by those accustomed to the use of hammers. A poor nail is about the most provoking thing in existence, and there is no excuse for their manufacture. We have heard no complaint concerning the product of the Pacific Iron and Nail Company, and it is fair to presume that the poor nails have come from abroad. We understand that the local factory at Oakland has recently added a line of French wire nail machines, and is now prepared to turn out all kinds and sizes of this description. The demand for wire nails has become quite prominent in the last three years, and we are glad that they are now made here. They are largely used by sash, door, furniture and organ manufacturers, picture frame makers, car builders, and house and office furnishers. They are quite stiff, and can be driven into hard wood without the use of a brad awl. They number more to the pound, and are therefore considered cheaper than other sorts.

The Pacific Iron and Nail Company undertakes to make every nail known to commerce. The list is altogether too long to print in this connection, and prices vary with the size and description. The enterprising gentlemen who started this industry on our shores deserve well of their fellow citizens, and it is a pleasure to know that their efforts have been appreciated. The wonder now is that a nail factory was not started here ten years earlier. It meets a long-felt want of this city and coast.

Cherish a Slow Man.

If you have got a "slow man" in your shop, then cherish him. He is a treasure. We don't include lazy men or time killers; bounce them at once.

A genuine "slow man" will do more work than two "lightning dodgers." To one unacquainted with him the slow man seems to be principally engaged in getting ready to do his work, but just about the time you think he has "got ready," the job is done.

He never does a job wrong, or makes a false move. He *thinks*. He plans a blow before he strikes. You never knew him to make a bull of a job and then have to work eight hours to get rid of the mistake. When he makes a mark, he knows it is in the right place, and he takes his time to work to his marks, and has confidence that his work will come together.

Watch the slow man and the lightning chap. They are both at work making patterns for a clamp box. The slow man selects a piece of nice timber, takes it out of wind and squares it up. He is sure he has got plenty of stock. He picks each part from the drawing, cuts a paper pattern of each and blocks out each piece. He will finish up two or three and have the glue drying while he is making core prints and rounding corners.

The lightning chap has found a chunk of wood under the bench which he *thinks* will be "big enough." He measures the patterns, makes a few marks on his blocks, and begins to cut it out. How he makes the chips fly! He cuts and chisels, and then stops to measure. One end of the block is worked down to shape of the box and then he finds it is coming out ⅜ inch short, and a piece must be glued on. While he is waiting for the glue to "set," the slow man gets all ready to glue on the last core print. It takes quite a number too, as the bolt holes are all cored out; it makes a better job than if the holes had been drawn in green sand.

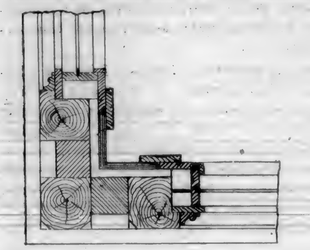
The slow man rounded each piece before he glued them together. He don't have to work into bad corners with his sandpaper, and he is all ready for the first coat of black before the fast man has got his work all blocked out.

Everything is done when the slow man lets go of it. He don't have to look all over his work nine times to see if the splits and jambs are all worked out. When the first coat of black is dry he runs in one or two wax corners and fills up a worm hole, puts on two more coats of black, sandpapers a little, and the job is well done.

As he takes the pattern down to the foundry, he carries the shellac to the "lightning" man, who is just gluing on a corner which he knocked off as he was cutting it down in a "hurry."—*J. F. Hobart, in Wood-Worker.*

A Clergyman on Shavings.

Rev. Dr. Paxton, in a lecture before the Mechanics' and Tradesmen's Union, a few evenings ago, stated in a few words a good many truisms. Shavings, the lecturer said, were not of American invention, like whittling, but were as ancient as the working of metals by Tubal Cain. They are the necessary waste of every work. There is a certain loss from every gain; there is no building without its rubbish heap to remove, which requires almost as many carts as to bring the building material. The fewest substances in nature are found pure. Construction is based upon destruction. Every joy presupposes a sorrow. The door posts of progress are sprinkled with the blood of its martyrs, and along the way are scattered like millstones the bodies of those who have fallen in the path. We cannot get something for nothing; for every tit there is a tat. The wrecks of rich men's sons to be seen everywhere show that it is as hard to keep as it is to get. Without toil there is no substance; hence the recklessness with which estates are squandered, without any regard for the toils and hardships that had to be undergone to procure them. It may be likened to the sacrifice of human life at the battle of Bunker Hill, through which the salvation of our country was procured.—*Scientific American.*



Plan of Corner of Baywindow

Oil Stones.

Keep your oil-stones clean. Many users of oil-stones keep them full of oil all the time, all covered with dirt and gudgeon-grease, and when they want to use them, must scrape a place with a chip before they can make the tool "take hold." Wipe the stone clean after using. Do it every time, too, not once in a while. Get in the habit of it, and it will come natural.

Don't let a stone get gummed up. If you have been guilty of keeping such a one, just take a new deal and "try out" your stone. Put it in a kettle with water and potash—some soapine will do first-rate (and soapine should be kept on the sink of every shop in the land)—and set it over a fire, or stick a steam pipe into it. Boil for an hour or two, then soak and wash well in clean water. You will then be able to see what your oil-stone looks like, and it will "take hold" like a new broom.

Some men place their oil-stones in the sun and let the oil try out. But the potash is the best; it "kills" the grease on the spot.

An oil-stone needs "truing up" very often. I remember, when a boy, of truing a stone. Our worthy father set us at the job of rubbing the stone on a board covered with sand. How slow it did cut! It generally took two or three hours to do the job. Every three or four "rubs" I would have to examine to see if it was "most done;" and then before I got to work again, Tim Blodget would come along and try to argue me into "goin' fishing," and then how I hated that oil-stone.

Don't let a stone get too "hollowing." Use long strokes in rubbing a tool upon it. If it gets a little worn in the center, take it to the grindstone or a big emery wheel. Hold it against the *side* of the wheel; not on the face. It will take but a very few minutes to grind the oil-stone true and smooth.

I never yet saw a loafer hang around a shop half an hour without getting out his jack-knife and "going for it" upon the middle of an oil-stone. If I have a knife to sharpen, I do it near the *end* of the stone. The ends don't wear down; it is the middle that gets most of the work. Some journey-men put a wire across the middle of their oil-stones. They have to work each side of it, but the loafers have to, too.

If you break a stone, don't throw it away. If thick, or nearly new, boil the grease out of it, and *glue* it together with common glue. It will hold if you get all the grease boiled out before you put on the glue. If the stone has become worn pretty thin, you had better grind it down into slips. It will make some nice ones of the very best quality.

Don't put the stone into a block of wood. It makes a nasty thing to keep clean; go to the hardware store and buy a nice oil-stone holder. You can put it on in two minutes, and take it off in "no time," and wipe the stone clean as often as you wish.

A hard, glossy oil-stone is not worth buying. A stone which looks like a piece of marble is good for nothing. A stone with a sand-stone complexion is too soft, and will work bad. The "muddy" stone is another to be avoided. Somewhere I have seen a receipt as follows: "Draw your thumb nail along the stone; the faster it cuts away the nail the better the stone." It looks reasonable, but I have never tried it.

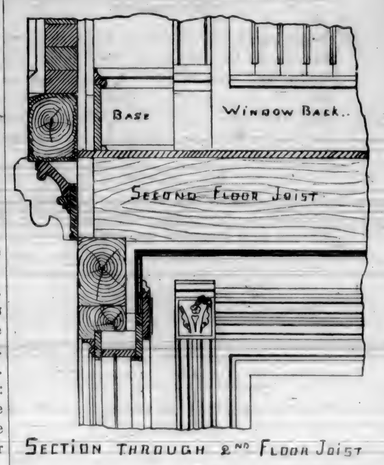
Petrified wood makes the best oil-stone. I have a Scotch stone which cuts very fast, yet will set an edge to "cut a hair." Some years ago a firm started to manufacture "silex" stones for oil and water, both hand and power. The "silex" stone was ground fine, mixed with some secret "uniting compound," and moulded under hydraulic pressure. The stones thus produced were pretty good, but were apt to "glaze," and then neither oil nor water seemed to have any effect in removing it. Whether or not they are made now, I do not know.

There is a knack in using oil-stones well. Don't rock your hand and make six or eight bevels on the work, or else make a curve in place of a flat "bevel." Keep your wits upon the top of the tool, and see that it travels as fast as the bottom edge does. The tendency, when pushing from you, is to lower the top of the tool, but a little attention to this point will enable a man to do a job right, and get a better edge in the very shortest time.—*American Machinist.*

Measuring the Height of a Tree.

There is a very simple way of measuring the height of a tree, which can be practiced by any one on a sunny day or in bright moonlight. All the apparatus that is necessary is a straight stick, of any length. Draw a circle with a radius (half the diameter) of a little less than the length of the stick. This will be done by holding one end of the stick, say two inches from its end, and moving the other end around, making the circle with a knife or a chip. Then place the stick in the ground exactly in the center of the circle, perfectly upright, and press it down until the height of the stick is exactly the same as the radius of the circle.

When the end of the shadow of the stick exactly touches the circle, then also the shadow of the tree will be exactly in length



Section through 2nd Floor Joist

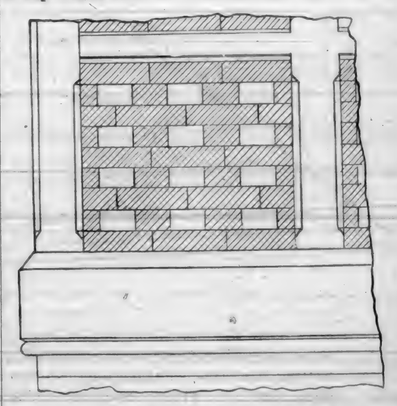
the same measurement as its height. Of course, in such a case, the sun will be at an exact angle of forty-five degrees.

Measurements of this character can be best effected in the summer, when the sun is powerful, and has reached to a good height in the heavens, and when the trees are clothed with living green, so as to cast a dense shadow.

To many to whom this idea may not have occurred, it might be made annually a matter of interest thus on warm summer days to take the height of prominent trees, and so to compare growth from year to year.—*Hall's Journal of Health.*

A chicken with a clipped wing made several ineffectual attempts to fly over a fence. An Irishman, who witnessed the efforts of the "chick," laughingly exclaimed: "Begorra, she has a defective flew."

Bound Volumes of 1884 Now Ready. Price, Post-paid, $2.50.



Elevation of Brickwork First Floor

Brick-making.

WE hear a great deal said of late about perfect brick. We mean by this brick with sharp and well defined edges and corners. Not only this, but they must be straight, so that when two are placed together in a wall the edges come close together the entire length of the brick.

In common building, brick defects are not so often noticed, but in front or ornamental brick it is absolutely necessary, in order to make a good job, that the brick be straight, the same thickness at each end, and of uniform size. The reasons are many why brick so often come short of these requirements.

First, as to machine-made brick. Almost all machines that deliver the clay in a continuous stream, with wires or other means of cutting the clay into proper lengths, make crooked brick.

One reason is that the wire in cutting the clay drags the end of the brick, or if cutting the length way of the brick pulls the sides down.

Another reason is, the clay is not of a uniform density in the brick, the machine often delivering more clay to one or other of the sides or edges, thus causing the brick, if not crooked when made, to dry crooked.

The mud machines that make each brick in a separate mould-box often feed one side or end of the mould heavier than the other, and again the brick are often dumped in emptying them out of the moulds and hence dry crooked, and I assure you they get no straighter in burning.

The same difficulties are often encountered in hand-made brick.

The clay is often pressed unevenly into the mould, and in striking it is drawn to one end, and in off-bearing the brick are dumped.

These difficulties need only to be mentioned to suggest a remedy.

First. The machine builder must build his machines so that they will make brick of uniform density throughout. This applies to dry press machines equally as well as to the mud machines.

Second. The brick must be properly delivered from the machine and properly placed on the floor for drying.

But brick machines and hand-moulding are not to be charged with all the crooked brick made.

A brick may be ever so well made, and unless dried properly, it will be crooked and ill-shaped.

The manner of drying brick of course depends largely upon the clay, but there are a few thoughts that equally apply to all clays.

Those who use drying floors have noticed, no doubt, that the brick draw up at the ends. This often comes from too fast drying, and often from the floor being too dry when the brick are placed upon it. We find that by wetting our floors before placing the brick on them they dry without warping. Where the brick are dried in the sun, if the clay is at all dense, they are apt to warp, especially if the ground is moist. As a general rule, the ground should have one day's sun between each day's drying.

In making press brick the drying is very important.

The mud must be of a uniform moisture when the brick are moulded, and the brick must be uniformly dry when pressed. If not they will be of different sizes.

In order that they be straight, each brick must be uniformly dry when pressed and set in the kiln.

If one end be dryer than the other, or if the corners be dry, the brick will not come from the press straight. There being more rebound in the moist portion than in the dry, when the brick is taken from the press, the moist portions swell, leaving the brick of uneven size.

This can be overcome by hacking the brick before pressed into large piles and covering them with wet cloths. In this way the moisture becomes equally distributed through the entire hack, and they become moist.

After they are pressed they should be placed on a moist floor, yet warm enough to dry in hacks of from five to eight high.

The bottom brick should always be perfectly level. They should remain in these hacks until dry enough to handle without damaging them, then taken down and rubbed with the hand and hacked on edge eight or ten high. We are aware that press brick makers have many ways of handling brick, but we have found the above to be the best and surest way to have them dry straight.

If they are straight and thoroughly dry when they are set, they will come out of the kiln in good shape.—*W. A. Eudaly, in Clay Worker.*

An Amateur Carpenter.

BILL NYE, in the Denver *Opinion*, relates his experience as an amateur carpenter, as follows:—

In my opinion every professional man should keep a chest of carpenter's tools in his barn or shop, and busy himself at odd hours with them in constructing the varied articles that are always needed about the house. There is a great deal of pleasure in feeling your own independence of other trades, and most especially of the carpenter. Every now and then your wife will want a bracket put up in some corner or other, and with your new, bright saw, and glittering hammer you can put one up upon which she can hang a cast-iron horse-blanket or lambrequin, with inflexible water-lilies sewed in it.

I made a very handsome bracket last week, and I was naturally proud of it. In fastening it together, if I hadn't inadvertently nailed it to the barn floor, I guess I could have used it very well, but in tearing it loose from the barn, so that the two could be used separately, I ruined a bracket that was intended to serve as the base, as it were, of a lambrequin which cost $9.00, aside from the time expended on it.

During the month of March I built an ice-chest for this summer. It was not handsome, but it was roomy, and would be very nice for the season of 1884, I thought. It worked pretty well through March and April, but as the weather begins to warm up that ice-chest is about the warmest place around the house. There is actually a glow of heat around that ice-chest that I don't notice elsewhere. I've shown it to several personal friends. They seem to think it is not built tightly enough for an ice-chest. My brother looked at it yesterday, and said that his idea of an ice-chest was that it ought to be tight enough at least to hold the larger chunks of ice, so that they would not escape through the pores of the ice-box. He said he never built one, but that it stood to reason that a refrigerator like that ought to be constructed so that it would keep the cows out. You don't want a refrigerator that the cattle can get through the cracks of and eat up your strawberries on ice, he says.

A neighbor of mine who once built a hen resort of laths, and now wears a thick thumb-nail that looks like a Brazil nut as a memento of that pullet corral, says my ice-chest is all right enough, only that it is not suited to this climate. He thinks that along Behring's Strait, during the holidays, my ice-chest would work like a charm. And even here, he thought, if I could keep the fever out of my chest, there would be less pain.

I have made several other little articles of *vertu* this spring, to the construction of which I have contributed a good deal of time and two finger nails. I have also sawed into my leg several times. The leg, of course, will get well, but the pantaloons will not. Parties wishing to meet me in my studio during the morning hour will turn into the alley between Eighth and Ninth Streets, enter the third stable door on the left, pass around my Gothic horse, and give the countersign and three kicks on the door in an ordinary tone of voice.

An auger which bores a square hole is now in common use in Cleveland, where a joint stock company is being organized for the purpose of manufacturing them for the market. The *Herald* of that city thus describes it: "Its end, instead of having a screw or bit, has a cam motion which oscillates a cutter mounted on a steel rocking knife which cuts on both sides. In order to prevent the splitting of the wood the ends of the cutter are provided with small semi-circular-shaped saws which help in cutting out perfectly square corners. It is estimated that this new process will save the labor of three men who work with chisels, as one man can conveniently cut a two-inch mortise in the same length of time that he can bore a round hole."

Bound Volumes of 1884 Now Ready. Price Post-paid. $2.50.

A Plain Talk with the Boys.

"ANYTHING that is worth doing at all is worth doing well." Never allow this to escape your memory. Be punctual at your work in the morning; try to be on hand fifteen minutes before the regular time; assist in cleaning up the shop; get out what material is wanted by the journeyman you are helping, and have it in readiness to start with him promptly on his arrival. While in the shop, keep everything looking clean and tidy; have a place for everything, and keep each thing in its place. If you want a tool of any kind, do not have to rummage through half a dozen drawers to find it. Keep the man's tools you are with in a building close together; watch his motions closely and you will be able to know nearly every time what tool he wants next, without his asking for it; do not wait to be told to put on your solder-pot after the man is ready for it; have it ready for him when he is ready; he will appreciate that you are trying to assist him, and paying strict attention to your work more than if you should wait for him to tell you everything.

Never leave a fire you have been using anywhere about an unoccupied building when you quit work at night; see everything safe before you leave. Don't annoy the cook in the kitchen by insisting on heating your metal on the stove or range; she has her cooking and baking to attend to, and the progress of her work is just as important to her as yours is to you. Take your pot outside and build a fire in the street, if you can do no better; by doing so you will often save a great deal of trouble and annoyance. In going to and from your work, and always when on the street, "brace up;" don't go along in the everlasting hang-dog, slouchy kind of way, as if you were afraid of getting somewhere two minutes before time. It looks more like business if you "pull out" like a man,—as though you had to make a train and were afraid of being late. I have seen boys on the street with tools on their shoulder, a pipe or stump of a cigar in the mouth, ambling along as though they were very tired, or afraid of getting to the shop five minutes before quitting time, for fear they might be started on another job. I am sure that if their employers could have seen them they would have much rather the boys would spend their time, if they had any to spend, in the shop. It is just such movements and actions as I have described that attract the attention of employers and customers and make them dislike you. Do your work quickly, neatly, and quietly; move briskly to and from your work, and you will gain friends in the shop and out, and gain the confidence of your employer, who is not slow in noticing any little defects or faults, if you have any, and whose interest it is to advance you as rapidly as possible, if he sees by your actions and work that you are trying to advance yourself. This may seem all very funny to you, but it is plain talk, and I think most of you know what I have stated to be facts, and facts are said to be very stubborn things, and it is best we should know how stubborn they are.

You must not think that all these little things are not noticed by the people you have to deal with every day. They are; and the success or failure of your future life depends very largely upon your present conduct and actions. Ever remember that politeness and a pleasant answer cost nothing at any time—have them always ready—and that neatness in dress and personal appearance, quick, lively movements and a watchful eye to business are the qualities that win.—*The Sanitary News.*

Mortar.

IT is commonly supposed that anybody is competent to make mortar, while, judging from the results attained, nobody seems to know much about it. Good mortar is a solid silicate of lime—that is, the lime unites with the silica or sand, thus forming a silicate of lime. In ancient days those who had some conception of the way these two materials united, superintended their mixing, and the result was mortar, specimens of which have come down to us, and which are far superior to those that we are commonly using. Dry lime and dry sand laid together, or mixed and kept dry for 1,000 years, would not unite to form a silicate of lime any more than acetic acid and carbonate of soda dry in a bottle would effervesce. To make silicate of lime just as good as was made by the Romans, all that is necessary is to proceed intelligently: procure good caustic—*i. e.*, fresh-burned lime—and if you find it all powder, *i. e.*, air-slaked, don't use it; use only clear lumps. Slake this, using only enough water to cause the lime to form a powder. To this, while hot, add clean sand, not dirt and loam called sand, but sand; and with the sand add enough water to from a paste. Then let it lie where it will not become dry by evaporation—in a cellar, so much the better, for as soon as you have mixed the sand and lime as above, they begin to react one on the other, and if not stopped by being deprived of moisture will go on reacting until silicate of lime (as hard as any silicate of lime ever was) is formed. But if you take this so-called mortar as soon as made and lay bricks with it, unless the bricks are thoroughly wet you stop the formation of silicate of lime, and might as well lay your bricks in mud. Lime and sand, after being mixed, might lie two years with advantage, and for certain uses, such as boiler setting, or where the whole structure of brick and mortar is to be dried, the mortar ought to be mixed for one year before use, and two would be better; but for house building, if the bricks are so wetted as not to rob the mortar of its moisture as soon as used, mortar that has been mixed a month will form good, solid silicate of lime among the bricks it is laid with in ten years, and will be still harder in one hundred years. The practice of mixing mortar in the streets and using it at once is as foolish as it is ignorant, and would be no improvement.—*The Mechanic.*

Painted Floors.

THAT carpeted floors are harborers of disease is a question which, to those who have been placed in position to fully investigate, has but one side; and since some of our leading journals have called to mind long arrays of unquestionable authorities proving that carpets, however clean and free of dust apparently, give off at every step or movement infinitesimal germs of lung irrants, the people seem to have indorsed the theory, and in many a fine house carpets have given place to Eastern rugs, which, occupying a central position, leave a fine opportunity for the painter to display his taste in decorating the intervening space between the rug and wainscoting. It will, however, place the work and imperfections of the carpenter more prominently before the people, inasmuch as the floor, being constantly exposed, must be made smoother and of better lumber than often finds its way into the floors of our houses, for when the floors were entirely covered with carpets, damp, unseasoned lumber or timber, or the same affected with dry rot, could be used, and the occupants be little the wiser for the deception; but now the floors must be of good lumber and nicely fitted, else the painter, whose work supersedes that of the carpet-layer, will not accept the floor as the carpenter left it, for his work, being on top, he will be held responsible for its appearance forever afterward.

If this change in fashion brings about this revolution in floor-making, the change will have another argument in its favor; for others, as well as we, have seen damp, unseasoned lumber put in floors, which in turn were laid upon the joists of the same or even worse quality, and then a carpet covered over all. The poor inmates were thus compelled to breathe the moisture of seasoning lumber after it was filtered through a carpet, which tended to render it still more unhealthy, and hence we are of the opinion that carpets are responsible for much less disease than charged with; nevertheless, we are decidedly in favor of the rug system of covering floors, for the reason that it is much more economical, it is hygienically and otherwise a very wise plan, besides the facility of often removing and thoroughly shaking the rugs, without employing a lot of workmen to take up, and beat and put down again. It looks as though carpets, like the Chinese of the Pacific slope, "must go."—*The Manufacturer and Builder.*

AN exchange says: House building is a trade of itself, and a very complicated one, too, requiring not only a large experience and good credit, but also the possession of a discriminating judgment to pass upon the relations existing between demand and supply, the condition of the labor and material market, and the falsely excited or unduly depressed style of reality in particular localities.

Shingle Roofs.

THE form of roof known as a shingle roof is one of the greatest antiquity. When it originated or by whom invented history fails to tell us. It is probably one of those things of natural growth which never had a definite beginning, but came up by gradual steps of improvement from a very primitive form to its present shape. Reasoning by analogy, it may have originated in an attempt to imitate the feathers of birds, which shed water in a most remarkable manner. Its prototype is also found in the arrangement of leaves on certain trees. It may have been preceded by the thatch and some forms of bark roofs, and those have come into use as an improvement on a still more primitive type. Shingle roofs may be described as pioneers in roof construction. When timber is abundant a shingle roof is one of the cheapest that can be constructed. Its lack of durability in a comparative sense, and its frequent destruction by fire, make it less desirable than other materials; accordingly, as lumber becomes scarce, as house owners become wealthier, and as buildings improve in character, shingle roofs give way before material better adapted to stand the test of time employed in the newer sections of the country than in the older, and the use of shingles upon roofs is to a certain extent an indication of the class of buildings that are being erected. As pine timber becomes scarcer, and as prices for shingles gradually advance, their use in this country is likely to be more and more restricted until it is possible that in this country, as in England, the time may come when their employment will be the exception.—*Carpentry and Building.*

Boxwood and the Demand.

IT seems that the rapidly increasing use of roller skates has a marked effect on the price of boxwood, especially on the kinds most in favor for rollers. A dealer in hardwood recently gave a reporter of the *Sun* some interesting points in reference to the trade. If the facts accord with his statements, there are likely scores of enterprising dealers out of all patience with themselves for their failure to institute a corner in the stuff when the opportunity was at hand. "The roller skating mania has completely exhausted the market of a certain size of boxwood. Less than eighteen months ago I could sell a ton of three-inch boxwood for $38.00, and it would be a first-grade in every respect, and admirably suited for turning small work. The demand then was steady, and the principal consumers of the wood were rule makers, tool manufacturers, and turners who supplied the market with boys' tops, pool-pins, and toys of various sorts.

"The sudden and remarkable growth of the roller skating pastime has created a constantly increasing demand for a certain size of wood, and now it is impossible to purchase a ton of suitable wood for skate wheels for $120. Rollers are made in several sizes, ranging from 1⅝ to 2⅛ inches in diameter, and only the natural growth of boxwood approximating these sizes is fit for use. Large wood is too costly, and is less firm in resisting the tremendous strain of a skater's weight upon an axle only 7-32 of an inch in diameter. The boxwood grows in Persia and Turkey, and heretofore the crop has been handled in England. It is a wood of very slow growth, and in its native country stringent timber laws restrict the depletion of the growing trees. At the present rate of consumption, the world will be practically exhausted of its boxwood in less than twelve months unless some equally cheap and durable substitute is found to take its place."

Referring to substitutes, he said that rubber, celluloid, rawhide, vulcanized fibres, and compressed paper have been tried for making rollers, but for one reason or another have proved unsatisfactory; some have proved too soft, while others, like the pure celluloid wheels, have been found too expensive for the trade, and the necessary metal bushings have proved objectionable, because the grit and dust from the floor and the shoes of the skaters, wearing between two metal surfaces, have rapidly cut away the axles of the skate. Rollers with anti-friction bushings, consisting of a number of small steel plugs freely revolving around the axles, have been tried with some composition wheels with success, but they are very expensive, and on this account cannot come into general use. Other woods have been used, such as dogwood, apple, pepperidge, laurel, and lignumvitæ, but have for the most part been rejected. The lignumvitæ alone is hard enough, but it will not stand the strain of the small axle. Metal wheels having a surface of rubber are made, but nothing has yet been found which in all respects is as good as boxwood.—*The Mechanical News.*

Don't Botch a Job.

DON'T botch a job just for the sake of getting it done quick. You cannot do an hour-and-a-half job in sixty minutes and do it right. Some bosses think it is possible and are always trying it. Just take things easy and make your brains save your hands. Take time to get ready before you begin and you will get done before you know it. We do not mean for you to stand around talking about a job. Some men will talk about it longer than it takes to do the whole job. If you are intending to glue up a lot of pieces of board, it pays to look up your hand screws before the glue is put on. A man who gets the screws ready by opening them just the right distance and trying them to see if they work all right, will get done a good deal quicker than the one who gets his glue on, rubs the joint together and finds he lacks two screws. While he is running around to each machine in the shop, looking for hand-screws, the glue gets cold and the joint will not come up. He must wash the joint in hot water, wipe it all clean and then begin over again. If this man had begun right, he could have glued up two joints while he was doing this one. It is a common trick of hand-screws to get lost. They stray away and get covered up under lumber, shavings and fire-wood. Nobody ever took a hand-screw from its place, but it will be found just where you never think of looking for it. You may be sure of finding one or two at every machine in the shop, but you can't find the man who put them there. It is about like the story of the bull which jumped aboard a boat and chewed off the hay rope. The question was, "Did the bull steal the boat, or the boat carry off the bull?" The hand-screws have been carried off or they have run and hid.

If you have got a lot of good hand-screws, take good care of them. Do not leave them screwed up tight any longer than you can help. If you put them on a job during a dry day and a rain comes on, it is all you can do to start those screws, and they are strained unnecessarily. Oil your screws with a good fixed oil and then rub them full of plumbago or black lead. Just try it once; it makes them work nice and the weather does not affect them as much.

One of the most aggravating things that can happen is to have the doors opened while you are gluing. You get nicely at work, the glue just right, the stock well warmed, and begin to set up the joints. Just then the outside doors fly open and a team backs up with 1,000 feet of lumber, or the elevator well is opened and 10,000 cubic feet of cold air come up to see how you are getting along. If you intend to do much gluing, just build a room for that alone. Keep it at a temperature of 90 or 100 degrees and you can make good glue joints. There is one example that seems rather paradoxical in regard to gluing in the cold. In heading mills where barrel heads are made, the heads are pieced up with a coarse circular saw, rubbed together and set one side without clamping. All this is done in a temperature ranging anywhere from 15 degrees below to 60 above zero. Very few heads come apart at the joint, although they are all run through a pony planer and the paring-in machine.—*Exchange.*

THE *Builder and Woodworker* says that "among the unfortunate things of our times is the fact that in all branches of industry, as a rule, the workman has only an ordinary degree of skill. He plies his labor as the routine of his work compels, forgetful of the fact that the man of efficiency is marked, and when changes occur he is the one who is retained or advanced as the exigencies of the times demand. As our industries progress, new fields are opened, and the skilled workman is prepared for the emergencies of the hour that bring him a more remunerative labor. There is no need to question possibilities with reference to labor, for certainly its opportunities are without limit. Let every workman master his trade thoroughly and well, for the reward of so doing is not only in self-aggrandizement but in the strength of character that separates manhood from puerility."

Skin-Plumbing and the Architect.

IN discussing the question of plumbers' profits, my sole aim is to agitate the question to the end that good plumbing will be the rule,—not, as now, unfortunately, the very rare exception. Our societies throughout the country are doing a grand work in educating the master plumber to a just appreciation of the importance of his profession, and his responsibility for the health of his patrons; but, in order that we may have good plumbing, the architects' and health department's assistance is of the first importance; without their aid, the profession will ever remain what it is, —a fat, lucrative, healthy (for himself) business for that conscienceless thick-skinned humbug, the skin-plumber,—a fit subject for the sneers and jibes of every alleged joker and would-be smart Aleck. I have never—and I say it with deep regret—been in any society, large or small, where the name of plumber happened to be mentioned but that some one felt called upon to relate his or her experience with the plumber, and how he or she had been treated by that worthy object of their admiration. After very nearly twenty years' knowledge of, and acquaintance with, my fellow craftsmen, I am sorry to say that our bad name is not entirely undeserved. No doubt that deserving object of our consideration, the skin-plumber, sees nothing in all this but a joke; he is quite satisfied indeed to allow jokes or any remarks to pass at his expense, provided, however, there is prospect of an opportunity to retaliate in his own peculiar way; he will double the dose the next time. Give them something real to talk about, to sharpen their wits on; he don't believe in having folks trying to bother their brains about some imaginary wrong-doing of the poor, persecuted plumber. Oh, no! he'll see to it when his turn comes that the joker pays the piper.

Well, how far can the architects help along this good work,—ridding the plumbing business of that "snake in the grass," the skin-plumber? In this way only,—that any master plumber, unknown to them, seeking to figure in their offices, must show good and sufficient proof of ability and honesty in work already performed, from the owners of such work, who have had five year's trial of said work. If the plumber is a beginner, then he must show from his former employer that he is incapable of doing a skin-job, that he has a just pride in his profession; in a word, that he is an honest man. Architects are all interested in, and desirous of having, good plumbing work done. There is no architect who would knowingly employ or give countenance to a skin-plumber who desired to estimate in his office. Why then not insist on having proof, the only proof that counts for anything in regard to plumbing? During the construction of a job of plumbing, or the "roughing in," very few architects can judge intelligently or pronounce conscientiously on a suspicious looking job. It has to be seen with a plumber's eye, if the skin-plumber's practices are to be prevented during construction. A good thorough job is always surrounded by evidences of its completeness; it requires no expert to judge of its merits. But the skin-job, that's the sticker for the architect, to avoid which their only remedy is, select the plumber whose estimate bears evidence of his intention to live up to the specifications, and whose record is proof of his ability and honesty. The average superintendent, or owner, might just as well be superintending a surgical operation, with a view to directing it in all its nice details, as a plumbing job; he knows as much about one as the other. There is a similarity in the comparison, and a very deceiving one. Both the plumbing job and surgical operation may appear all right on the surface, but away down that little something remains undone, which, to the uneducated, botch-plumber, or unskilled physician matters little. But the plumbing doesn't work; the wound doesn't heal; both jobs have to be done again at greater expense and exceedingly more suffering than in the first instance. Then, I say, let the plumber give proof, as the doctor is required to, of skillful and honest practices, or let his practice be so very limited, for the want of something to do, that it will not be necessary for those who are tempted by his only means of getting work (low figures) to be deceived in him. He will then be like the shyster of any profession,—he can be known at a distance.

As I consider that the health department has most to answer for, for bad plumbing, I will leave consideration of its account to a future letter.—*Martin Moylan, in Sanitary News.*

If the reports that are current on terra cotta lumber are true, it seems almost a mystery that it is not manufactured on a more extensive scale. We are told that saw-dust mixed with common clay, pressed and baked, gives the desired product, which admits of nearly all the uses to which true lumber may be put, besides being fire-proof. Would saw-dust, now too often looked upon as a nuisance, not form an important item in the market if it could be utilized in this way? Or is lumber so plentiful yet that we can ignore the utilization of the waste incident to its manufacture? When statistics tell us that the northwestern lumber region alone produced during the past year the tremendous quantity of about 2,534,3 0,000 feet of lumber, 1,059,000,000 shingles, and about 630,100,000 lath, we may well pause and ask how long the supply will be able to meet the constantly increasing demands.

The utilization of the waste products has always been one of the most important sources of income to any industry, and the near future may demonstrate conclusively that lumbering will no longer be an exception to this rule, that attention must be paid to the enormous waste in its production, and that some means will have to be devised to either prevent or utilize it. Gas making from saw-dust awaits further development, terra cotta lumber may serve in this connection a two-fold purpose, and many other inventions will be made as soon as the necessity for such a thing is felt throughout the country. Perhaps lumber is too cheap at present in its original cost, but it will not be like that forever; as the most available portions of woods are cut down, the more inaccessible parts will necessitate larger expenses to bring them to market, and the question of "waste" will assume prominence in proportion to this increased cost, and saw-dust may yet prove one of the most important items of profit to the lumber industry in a similar way as the "gas liquor" of gas works, which the manufacturers did not know how to dispose of thirty years ago, now pays them larger profits than any of their other products. —*The Lumber World.*

Never stand at the foot of a sick bed and survey the patient. All figures loom large to fevered eyes, and by the side of the bed are only partially seen, and do not annoy with the sense of too much presence. Do not open the door very slowly, for then the attention is strained, speculating as to who the next comer can possibly be after all this preparation and with such cautious approach. Low but clear tones, quiet but sure movements, and rapid, rather than slow, are a great relief to any patient who is blessed with a practical nurse. Whispering is torture. Silence is best until you can discuss matters in another room; but if you speak, speak out, and make no mysteries about anything. In severe illness the nurse must watch her patient steadily, but not seem to be looking. In convalescence it frequently soothes the invalid to have the nurse seated at the window, apparently looking out. This frees the faculties from the tension that the sense of being watched usually gives.—*Hall's Journal of Health.*

Choosing Hand Saws.

STIFF blades are made of better material than thick ones, and are less liable to "buckle" or "twist," and are not so apt to break. They require less set, will stand an edge longer, and are not so tiresome to work. They should be hung in plain beech handles with rivets flush or countersunk. The blade should be of a dark color and have a clear bell-like ring when struck with the ball of the finger. Blades of a light iron-gray color are not so good. Never take a saw that jars or trembles in the handle. The first point is to grasp it by the handle and see that it *hangs* right, and that the handle fits the hand properly. Then try the blade by springing it and see that it bends regular and even from point to butt. See that it has a good crowning breast. Hold it at a distance and get a proper light to strike on the blade and you will see if there is any imperfections in grinding or hammering.

THERE should be less pride felt in peculiarity of employment and more in excellence of achievement.

Piece Work.

As a rule the man who is employed at piece-work, excepting in those trades where, from the nature of the work, it is habitual and general, is more spasmodic and less regular in his work than the day worker; he frequently runs himself aground, and then he uses stimulants to assist him in keeping up the speed. He can often take an hour or a day, and by dint of driving will contrive to make it up, at least in part, during the rest of the week. This kind of work is not a fair test of a man's abilities; what is wanted is a fair average day's work, taking one day with another all through the year. Piece-work, as a rule, will not give this. If an engine-driver lingered on some part of his journey and then forced his engine at high pressure over the other part, he would be regarded as a dangerous and reckless fellow, to whose care the lives of passengers should not be intrusted. Regularity is required, as well as speed, in all trades and occupations, for the moral in the fable of the tortoise and the hare is as applicable in the case of labor as it is in every other department of life.

Again, when the price of a certain job is fixed on the piece-work principle, the employer usually takes the quickest workman for his sample and test, and calculates the price accordingly; by this means he tries to fix a maximum price for the worker, the less expert workman falling below that price in proportion to his lack of power to compete with the strongest. This seems fair enough on the face of it, but it is not so fair as it seems, for the strong man will *tax* his strength to earn as much as he can, while the weaker will *overtax* his in order to compete and to enable him to earn anything like decent average wages.

It is the old tale, after all, of the employer's trying to fix a maximum wage, and the workmen trying to fix a minimum; if employers are justified in seeking the one, the workmen are equally justified in trying to enforce the other. Moreover, by means of piece-work, employers are often able to cause wages to fluctuate—with a tendency ever downwards; for if a man earns a few shillings over the current wages of the district, the conclusion usually is that the price paid is too high and must be reduced, hence an effort is perpetually being made to lower the wages. Again, each man is more isolated, and as a consequence weaker, and therefore more likely to be compelled to accept the reduction because he is detached from his fellows. This is the secret of some employers' love for piece-work, and of their desire to enforce it whenever practicable; and this is precisely the reason why the workmen strive to restrict it, as far as possible, within the narrowest limits. The mode of fixing the price is one great obstacle to its universal adoption; another is its inapplicability to many of the industries of the country.

Another evil in connection with piece-work is the tendency to "scamp" the work; the chief interest a man has in his work is to get it done, and receive the wages; beyond that his interest is *nil*. This is the reason why all the best work is done by the day, skill being more requisite than speed—the man has time to finish his job in all those small details which make true workmanship, and distinguish a real work of art from the ordinary productions of the workshop. It is useless to talk about a man's pride in his work; he will take as much pride in it as he can afford, neither more or less; if art workmanship be required, it must be paid for; time is often the equivalent of skill; if the former be denied, the latter cannot be effectively exercised.—*Carpenter.*

Paint for Protecting Roofs.

THERE are frequent inquiries about the use of coal tar paints for roofs, and all over the West parties are patrolling the villages with their stink-pots of coal tar, and swabbing every roof they can gain access to. I have had twenty years' experience in the use of coal tar mixed with ground slate, iron ore, mineral paints, and the so-called asbestos—all about alike—and I know what I am talking about. They are unfit to use on wood or tin. They will cause wood shingles to crack and curl, and tin to corrode. A gentleman of utmost reliability has just told me that two new shingle roofs were last fall covered with a preparation of coal tar, petroleum and ground slate, and they are ruined—the shingles have curled up, and the owners are preparing to new-roof the buildings.

To make a desirable cheap roof paint, take four pounds yellow ochre, one venetian red, and add a little white lead and a very little lamp-black—the last two ingredients to improve the color simply—and mix with raw linseed oil. The lamp-black should first be mixed or ground in a little oil so as to mix smoothly with the rest. This will make a durable paint, costing less than seventy cents a gallon at the present price of oil, and can also be put on with a good whitewash brush, or a wide flat brush costing about seventy-five or eighty-five cents.

However valuable coal tar may be for some uses, it is not fit to be used on shingles, or ood exposed to the sun or weather.—*Charles Betts.*

THE AILANTUS.—Many complaints have been made of the overpowering and offensive odor of the flowers of the ailantus trees planted in the streets of Paris and other large cities. According to M. E. André, it is only the flowers of the male trees which exhale this unpleasant scent, and he recommends that none but female trees should be for the future planted in public or other places where the peculiar odor of the males might be offensive. This would seem an important point for Americans and others who plant the ailantus largely as a street tree.—*Woods and Forests.*

Bound Volumes of 1884 Now Ready. Price Post-Paid. $2.50.

Our Exchanges.

WE have made arrangements with the Editors of the following Journals, by which we are enabled to offer quite a reduction to those subscribing for any one of them in connection with this Journal.

(The figures in parenthesis denote the price of the journal alone.)

CALIFORNIA ARCHITECT AND BUILDING NEWS
Terms, $2.00 per annum.

With *American Architect* ($6.00),
$7.00 per annum.

With *Builder and Wood Worker* ($1.00),
$2.50 per annum.

With *Inland Architect and Builder* ($2.00),
$3.50 per annum.

With *Building* ($1.00),
$2.50 per annum.

With *Northwestern Lumberman* ($4.00),
$5.00 per annum.

With *Scientific American* ($3.20),
$4.50 per annum.

With *Leffels' Mechanical News* ($1.00),
$2.50 per annum.

With *Decorator and Furnisher* ($4.00),
$5.00 per annum.

With *The Wood Worker* ($1.00),
$2.50 per annum.

$3.50 per annum.

With *Hall's Journal of Health* ($1.00),
$2.50 per annum.

NEW PUBLICATIONS.

Mechanic's Geometry, or the Science of Framing by the Aid of Card-board Models. New edition of 1885. With the aid of card-board models, and the rules and explanations given, the mechanic can readily learn the method of getting the length and bevels of every description of rafters, hoppers, etc. Stair work is also treated in a manner that at once arrests the attention of the student, and becomes an attractive study. This book will also be found useful, though possibly in a less degree, to those who have already become mechanics, but who have not learned the science involved in their trade. The main object of this work is the elevation of the working man to the dignity of the master mechanic Price, Five Dollars.

The Artisan, or Practical Methods That May be Applied to Works of Building and Other Constructions. New edition of 1885. Among the practical ideas in this work will be found the utility of the right angle, and its application in a living many useful problems. By means of a right angle the exact circumference of a circle is determined at once. It also shows a simple and correct method for the measurement of boards, floors and other surfaces. It is applied to lines of any length, and divides them into equal parts. It gives the cuts and lengths of rafters, braces, and other timbers in framing. There can be no doubt as to the value of a right angle and its utility in this connection. It is clearly illustrated in the *framing square*, a tool which solves nearly every problem in practical geometry. Price, Five Dollars.

Science of Carpentry Made Easy. The work, *par excellence*, for every mechanic to have in his possession. It is thoroughly practical in its character, and contains much information not to be found in any other publication. It excels in its methods of obtaining the length and bevels of every description of rafters, both common, hip, and valley. Price, $5.00.

Builder's Guide and Estimator's Price Book. This work is chiefly intended to assist the Builder and Contractor in making estimates of the cost of work they may be competing for. It is written by the author of the "Steel Square and its Uses," which fact is a guarantee that the book is practical in its character. Price, $2.00.

Detail Cottage and Constructive Architecture. To the general country mechanics, this work is invaluable. Every part of a building is thoroughly detailed, including store fixtures, counters, fences, etc. Price, $10.00.

Interiors and Interior Details. A large work, and as its name implies, contains details for every style of interior finish. The plates are all handsomely lithographed. Price, $7.50.

Hand Saws and the Art of Saw Filing. This book gives full information for putting in order all kinds of saws, from a carpenter's panel saw to a steam saw mill. Illustrated profusely. Price, $1.00.

Building Superintendence. A new work and one that should be in the hands of every architect, contractor, and student. Price, $4.00.

Practical Carpentry. As its name indicates, this work presents practical answers to those questions that so frequently vex the mechanic. Price, $1.00.

MASONS' AND BUILDERS' EXCHANGE
OF SAN FRANCISCO
Room 11, 314 Montgomery St.

BELOW will be found a list of the members composing this Exchange. Boxes are provided for each member, so that architects, owners, or others desiring the services of any particular member, or those having boxes who are not members, and yet whose business is directly connected with that of the Exchange, can readily secure the attendance of the party sought, by leaving a note in the respective boxes.

BUILDING INTELLIGENCE.

Market, cor. First. Five-story brick.
O.—Mark Sheldon.
A.—Wolfe & Son.
C.—Riley & Loane, masons.
$80,000.

Camp, bet. Second ave. and Guerrero. One-story frame.
O.—Jac. Ellison.
A.—Wolfe & Son.
Day's work.
$1,400.

Twenty-third, nr. Alabama.
O.—M. E. Church.
A.—Wolfe & Son.
C.—H. C. Butler.
$1,300.

Geary, bet. Larkin and Polk. Additions.
O.—J. Schweitzer.
A.— — Kenitzer.
C.—Moore Bros.
$3,000.

Page, cor. Laguna. Three-story frame.
O.—Miss M. E. Green.
A. and C.—W. H. Wharff.
$4,650.

Mission, corner Twenty-fourth. One-story frame.
O.—McDonald & Co.
C.—W. H. Barrett.
$1,400.

Mission, between Twenty-fourth and Twenty-fifth. Two-story frame.
O.—H. Holman.
A.— — Gailfuss.
C.—R. Doyle & Son.
$7,000.

Howard, nr. Twenty-sixth. Two-story frame.
O.— — Winter.
A.—Schmidt & Havens.
C.— — Burgman.
$3,500.

Folsom, cor. Presidio Place. One-story frame.
O. and B.—P. Kennedy.
$1,300.

California Avenue. Two-story frame.
O. and B.— — Claffs.
$2,500.

California Avenue. One and one-half-story frame.
O. and B.— — Hurlburt.
$3,000.

Church, nr. Twenty-eighth. One-story frame.
O.—Mrs. Foster.
C.—G. B. Mills.
$1,200.

Clipper, nr. Church. Six one-story frame buildings.
O. and B.— — Claybour.
$12,000.

Willow, cor. Jessie. Two-story frame.
O.—Mrs. Kennedy.
A.—M. J. Welsh.
C.— Grace & Doyle.
$3,000.

Seventeenth, nr. Sanchez. Additions.
O.— — Worrell.
A.— — Swain.
C.—Terrill & Slaven.
$2,500.

Ford, nr. Noe. One-story frame.
O. and B.— — Dotsie.
$1,500.

Castro, nr. Market. Two-story frame.
O.— — Brady.
A.— — Daley.
$3,500.

Market, nr. Castro. One-story frame.
O.—M. C. Gimpel.
C.—G. Knopf.
$1,500.

Sixteenth, near Market. Two-story and basement.
O and B.—M. Arrion.
$3,000.

Noe, nr. Market. One-story frame.
O.— — Shannon.
C.—McMillan & Kean.
$600.

Noe, nr. Fifteenth. One-story frame.
O.—F. H. Merrill.
C.— — Grant.
$2,500.

Sixteenth, near Sanchez. Two-story frame.
O.—Mrs. Henniby.
C.— — Marrisy.
$2,000.

Seventeenth, bet. Mission and Valencia. Three two-story frame buildings.
O.—Wm. Cæsar.
A.—M. J. Welsh.
C.—J. Smith.
$7,000.

Broadway, near Hyde. One two-story and one one-story frame.
O.—L. M. Welsh.
C.—A. N. Nelson.
$3,000.

Mason. Additions.
O.—J. Burke.
$750.

Stevenson, nr. Ninth. Additions. Two-story frame.
O.—P. Maher.
A.—G. Miller.
C.—T. Sullivan.
$3,300.

Twenty-fifth, cor. Capp. Two-story and basement.
O.—Capt. A. Hall.
C.—Day's work.
$4,000.

Columbia, bet. Twenty-second and Twenty-third. One-story frame.
O.—M. Hoar.
C.—Day's work.
$1,200.

Twenty-third, nr. York. Two-story frame.
O.—T. Skilly.
Day's work.
$2,000.

Sixteenth, cor. Utah. Additions.
O.—H. Fischbeck.
Day's work.
$1,500.

Brannan, nr. Fifth. Two-story frame.
O.— — Johnson.
Day's work.
$1,600.

Silver, nr. Third. Additions.
O.— Mrs. Medcalf.
C.—A. Zihn.
$1,100.

Eddy, bet. Franklin and Gough. Two-story frame.
O.— — Levy.
A.— — Geddes.
C.—T. H. Day.
$12,000.

Central Avenue, nr. California. One-story and basement.
O. and B.—J. McClellan.
$800.

Pine, nr. Lyon. One-story frame.
O.—J. Bird.
C.—J. E. Logan.
$2,000.

Pine, nr. Baker. One-story frame.
O.— A. Levill.
C.—Bigelow & Son.
$1,000.

Baker, nr. Bush. One-story frame.
O. and B.—Robert Hocken
$1,500.

Bush, nr. Baker. One-story frame.
O. and B.—C. Krugel.
$1,500.

Bush, nr. Devisadero. One-story frame.
O and B.—Easton Bros.
$500.

Sutter, nr. Devisadero. One-story frame.
O.—H. J. Bedsold.
C.— — Main.
$2,000.

Ninth, cor. Mission. Two-story frame.
O.—F. Breen.
A.—A. Munn.
Day's work.
$1,000.

Mission, near Fifteenth. Two-story frame.
O.—Richard Roller.
C.— — Bradly.
$2,000.

Mission, near Thirteenth. Two-story frame.
O.—D. C. Fox.
C.— — Buckley.
$800.

Bush, nr. Hyde. Three-story frame.
O.—M. Petorelle.
A.—Geo. E. Voelkel.
C.—T. H. McKay.
$8,000.

Bush, cor. Hyde. Three-story.
O.—Mr. Gascow.
A.—W. Mooser.
C.—David Pare.
$9,000.

Tyler, nr. Fillmore. Two-story and basement.
O.—Mr. Farthon.
A.—W. Mooser.
C.—Mr. McKay.
$6,500.

Mason, nr. Greenwich. Two-story and basement.
O.—Arrata & Ratto.
A.—W. Mooser.
C.—Rocca & Co.
$5,000

Eighteenth, cor. Jessie. Two-story and basement.
O.—Mr. Underwood.
A.—W. Mooser.
C.— H. A. Sheldon.
$6,500.

Pine, bet. Devisadero and Broderick. Two-story and basement.
O.—Mr. Benjaman.
C —J. Tredwell.
$4,500.

Post, cor. Stockton. Union Cub Building. Four-story and basement.
O.—Wm. Walkerley.
A.—Wright & Sanders.
C.—Frank Barker.
$300,000.

Seventh, near Howard. Three-story frame, brick basement.
O.—August Hildebrand.
A.—H. Geilfuss.
C.—Henry Thom Wohrden.
$14,000.

Mission, nr. Nineteenth. Two-story frame.
O.—Mr. May.
A.—H. Geilfuss.
C.—M. Grant.
$4,200.

Twenty-second, near Harrison. One-story frame.
O.—Mr. Duclos.
A.—H. Geilfuss.
C.—T. Mitchell.
$1,600.

Mission, bet. Eleventh and Twelfth. Three two-story flats and store.
O.—R. Brennan.
A.—T. J. Welsh.
C.—J. Blake.
$7,500.

Morrel Place, nr. Broadway. Two-story flats.
O.—Mrs. Prince.
A.—T. J. Welsh.
C.— — Nelson.
$1,700.

Fourteenth, nr. Guerrero. Two-story.
O.—Mr. McCarthy.
A.—T. J. Welsh.
C.— McElroy.
$2,100.

Sansome, cor. Broadway. Lodging house and stores.
O.—P. Creagan.
A.—T. J. Welsh.
C.—Jas. Hayden.
$6,000.

Washington, above Mason. Reconstruction. Two-story.
O.—S. Levy.
A.—F. Hillert.
C.—J. E. Dunn.
$3,500.

Clay, cor. Polk. Two two-story frames.
O.—C. D. Cushing.
A.—Curtis & Bennett.
C.—D. B. Spangler.
$4,800.

O'Farrell, west of Fillmore. Two-story and basement.
O.—A. Levy.
A.—B. McDougall & Son.
C.—A. Jackson.
$7,000.

Vallejo, bet. Mason and Powell. Two-story frame.
O.—A. Kauhmann.
A.—Wm. Schrof.
C.—R. Morton.
$2,250.

Polk, bet. Eddy and Turk. Two three-story frames.
O.—Hohn & Saxtorph.
A.—Wm. Schrof.
C.—Day's work.
$11,500.

Sutter, nr. Franklin. Two three-story frames.
O.—Mrs. A. Lezinsky.
A.—J. Marquis.
C.—L. Wagner.
$20,000.

Beale, nr. Market. Four-story brick.
O.—Hobbs, Wall & Gilmore.
A.—Percy & Hamilton.
C.—Mason, — Cox; carpenter, — Fletcher.
$26,000.

Main, nr. Market. Four-story brick.
O.—Hobbs, Wall & Co.
A.—Percy & Hamilton.
C.—Mason, — Cox; carpenter, — Fletcher.
$27,000.

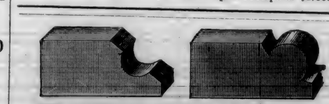
Modern Perspective. A perfectly new work. Should be studied by those who seek to excel. It is intended for the architect as well as the draughtsman. Price, $6.00.

Steel Square and Its Uses. Enlarged Edition This work is just from the press, and those wanting copies should at once order them. It is a great improvement on the author's former work, containing much that is new to mechanics—some of the problems presented never having before appeared in print.
We are agents on this coast for this celebrated work, and will mail a copy to any address upon receipt of $1.00.

T. C. NATIVEL,
LIGHT COMBINED FIRE-PLACE AND CHIMNEY STACK.
Patented March 3, 1885.
Can be manufactured either in Terra Cotta or Fire Proof Cement. Is positively fire proof, and the cheapest ever put up of any Patent Chimney.
STATE OR COUNTY RIGHTS FOR SALE.
Address, T. C. NATIVEL, Patentee,
921 Sacramento St., S. F.
Samples of the Chimney can be seen at my house.

BLUM, EPPSTEIN & MARSH,
MANUFACTURERS OF
Inlaid Wood Flooring
WOODEN MANTELS,
Hard Wood Interiors.
Office and Parlors 126 Kearny St., 2nd Floor.
FACTORY 209-227 FELL ST.,
SAN FRANCISCO, - - CAL.



BRICKS!

Single insertions for small ads, double above rates.
A square is seven eighths of an inch in length by width of column.

Advertisements alone inserted that refer to materials used in the construction and furnishing of houses, and to matters and trades belonging to the building interest.
NO OTHERS RECEIVED.

Monthly Summary of Building Improvements.

A larger number of buildings have been erected during the past month than for any other similar period on record.

We hear of dullness in every branch of business excepting those that are directly connected with the building interest. The glorious showers since the first of the month have caused even the merchants to put on a more happy look, while the mechanics' faces fairly beam at the prospects ahead.

We have made many inquiries in regard to the *real cause* of the building boom, but confess we are not satisfied with the answers received. Many attempt to explain that it is owing to the low price of building materials—not a satisfactory answer as we can prove. The price of lumber is, at the time of writing, $15.00 per thousand for rough, and $30.00 for surfaced.

In the flush times of the lumber pool, the prices were on the list $21.00 and $40.00. Now forty thousand feet of lumber will be sufficient for quite a large size dwelling. Allowing half of that amount for rough, and the balance for surfaced lumber, it would only make a difference of

THREE HUNDRED AND TWENTY DOLLARS

In first cost of lumber on a house worth probably $10,000. Most assuredly not enough to cause an owner to erect a building, merely to save difference in lumber between cheap rates and pool rates.

Again, hardware is now fully 20 per cent. higher than it was one year ago. Plastering is worth 2 cents a yard more now; with the exception of bricks, there is no article—wages included—that is not as high, and in many cases much more costly than they were in the closing months of 1884.

If it was the low price of building materials alone that keeps up the boom, every one would have used their greatest endeavors to build when the price of lumber was actually below the cost of manufacture, viz., $12.00 per thousand; the erection of buildings would have proceeded very briskly for a month or two, and then come to a sudden cessation. But

MONTH AFTER MONTH

There has been an average of four new buildings started for every working day in the month; and this average has been maintained for *seven consecutive months.*

Again, it has been stated that the low rate of interest allowed by the savings bank has induced many to put their savings into real estate and improvements thereon. A careful inquiry at the banks does not show this to be the case during the past month. The number of depositors still is on the increase, while the amount drawn is not in excess of the average.

We think the true cause of the boom lies in the fact that there is a

STEADY GROWTH IN THE POPULATION

Of this city. Manufactories have largely increased in number for the past few years, and have been the means of largely increasing the number of steady inhabitants. The cable lines are exerting a beneficial influence in keeping residents on this side of the bay. Our "glorious climate" attracts numbers from the East, who come for a spell, and then are so pleased at our resources, that they invest in our real estate as offering superior inducements for large profits. The main growth of the city is in the neighborhood of the Park

AND AT THE MISSION.

There are less vacant houses to rent at the Mission than in any other section. There is a beautiful valley facing the Industrial School that needs but one thing to make it the most thickly settled part of the city, and that is

CABLE CAR ACCOMMODATIONS.

From Twenty-sixth Street out to the county line, the distance should be traveled by means of a cable line. The speed from Twenty-sixth could be made much greater than from that point to the ferry. Cars should also be run from 5 o'clock in the morning, to enable workmen of every occupation to be at their work on time. Again, the price of tickets should be reduced to

SIX FOR TWENTY-FIVE CENTS.

If the above suggestions were carried into effect, we think that hundreds now going across the bay on account of cheap rents would locate on this side, and save much of the time now consumed in a trip by rail and boat of five miles and over.

SUMMARY.

During the month ending the tenth of April, there have been commenced in this city the very large number of

178 BUILDINGS, OF THE VALUE OF $1,221,045,

By far the greatest in number and value ever recorded for one month. To summarize:—

158	frame buildings—value	$718,095
2	brick " "	451,500
18	additions	51,450
178		$1,221,045

San Francisco Chapter American Institute of Architects.

THE regular monthly meeting of the Chapter was held in its rooms on Friday evening, April 3d. In the absence of the President, H. C. Macy occupied the chair.

The following report was received from the committee on classes:—

To the San Francisco Chapter of the American Institute of Architects:—

GENTLEMEN: Your committee, the teachers

of the architecture classes of the San Francisco Chapter, beg leave to submit the following report:—

They regret to say that, from unavoidable causes, two of the three classes which have been in progress for the current year have been suspended for the present, and it is thought unadvisable to resume them until some more satisfactory arrangements can be made in regard to them than is at present possible. The class in drawing is still maintained, and will be until further notice. The attendance on the classes has not been as satisfactory for the present year as could have been wished. Those who do attend, however, are tolerably regular and very diligent in their work; all are making commendable progress and are acquiring greater accuracy and better knowledge of their work.

To secure success in these classes it is thought that much would be gained by having a room properly appointed and furnished, in which the students could feel at home, and which could have the various conveniences not possible in a private office, such as, for drawing, good lighting, abundant space, and a good supply of models, copies, etc.

For the mathematical class, blackboards, proper apparatus for calculating strains, testing model girders, model bricks, and other model building appliances.

For the architectural class (practical), such plates, paints, drawings, and models as may best serve the important interests to which this class is devoted.

For all, proper periodicals and publications, which, being provided for the students, might engage their attention and broaden their ideas on matters of unusual interest connected with the profession.

The above are the views of only one member of the committee, the others not having reported. Respectfully submitted,

G. H. SANDERS.

The above is also endorsed by John Gash.

Report accepted, and ordered to be spread in full on the minutes.

A voluminous report was received from the Parent Chapter in regard to the supervising Architect of the State Capitol at Washington. A committee of three was appointed to thoroughly investigate the subject and report at the next meeting. The president appointed as such committee, Fellows John Gash, T. A. Eisen, and R. H. Daley.

The Committee on Indentures presented a full report, including two different forms of articles of indenture for apprentices. Report received and action thereon postponed until next meeting.

Mr. Gash read an interesting paper upon the subject, "THE SQUARE AS A FACTOR IN ARCHITECTURE AND GEOMETRY." Thanks of the Chapter were tendered to Mr. Gash for his able effort, and the paper was ordered printed in full in the CALIFORNIA ARCHITECT AND BUILDING NEWS. [It will be found in another column of this issue.—EDS.]

Men That Are North Winds or Western Gales with a Notification to All to Lie Low.

"HERE, there, don't you give but four blows to send that 8-penny nail home;" and then, without stopping to see whether the confused workman gives one or a dozen blows to drive the next nail to its head, the RUSHING (?) FOREMAN stumbles over a bunch of shingles in his hurry to tell another man—"Better file your saw sharper so you won't be all day cutting that *jice*."

Another workman who has just finished a 3-inch mortise through a very tough pine knot, and whose perspiring brow proves that he has been hard at work, happens to be met while, for a few seconds, he is wiping off the perspiration, with—"You going to stand there all day doing nothing;" and before the astonished workman knows who has spoken, the RUSHING FOREMAN has disappeard around the corner of the building.

Foremen of this character are extremely obnoxious to workmen. Beginners or apprentices are made so nervous that, for some little time after the suddenly spoken words, they are unable to do anything, and, in many cases, it takes half a day for them to regain their equilibrium. Old stagers, however, are worthy of attention by a looker-on after the visit of a cyclone foreman. We have carefully examined the different phases of character as presented in our various phrenological journals but we have failed to observe one that adequately expresses the mingled contempt, hate, go-to-the-devil look, that overspreads the countenance of the true mechanic. The plans of the latter are entirely upset by the unwarranted remarks of the foreman. But the greatest evil befalls the apprentice, for he is led to believe that a great noise and show of work is all that is necessary to please the boss; and so nails, in rustic or flooring, are sent home with three blows, utterly regardless that the head of the hammer makes many indentions in the wood, which, before painting, must be smoothed off, thus giving treble work, simply that the term *rusher* may be applied to their names.

Another great trouble with the kind of foreman under consideration, is his inability to give explicit directions just how he wants to have work finished. His mind is so intent on having all the work going on at a locomotive gait, that he turns from the boss of the framers before he has explained his wants, to tell the roofers what he wants done in their line; and then with a hop, skip, and jump, he is up in the second story trying to show the workmen there how partitions are to be set; then while gently mopping his forehead with his shirt sleeve, he prides himself upon his ability to give distinct orders, if necessary, to twenty different men in as many minutes.

The rushing foreman also inculcates another bad habit among the workmen. While he is around, the men feel strung up like a newly wound clock, but when he is away, a natural relaxation follows, and a positive don't-care-if-I-don't-work feeling is experienced, that, in a short time, becomes a habit, and, necessarily, leads spectators to exclaim, "That gang of men needs watching."

A few such foremen as we have described may be found in this city. They command no respect from the men under them, and, as a rule, they do not get as much work done as a man who is less noisy and demonstrative in the method used to have every workman know just what is to be done and the time necessary to perform the same.

Cause of the Depreciation in Our Lumber Market.

IT is a source of no little inquiry among our people as to what has demoralized the lumber trade during the past six months. As is well known, there existed for some time previous to the late break in prices, a combination among manufacturers to regulate prices by limiting the supply. The California market will consume annually 150,000,000 feet of redwood lumber. To supply this demand each manufacturer was allowed a certain quota, to be shipped to San Francisco, all the redwood lumber arriving in that port being, to all intents and purposes, sold through the agents of the combination. Last fall it was found that at least 20 per cent. more than the market would take would be produced the coming year, and it was proposed to reduce the quota allowed each manufacturer 20 per cent., and thus hold the market at the figure which had prevailed for two years past, giving the mill men good profits and enabling them to employ a larger number of laborers at good wages, thus making business lively in all the lumber regions. Several of the Mendocino lumber manufacturers refused to accede to the 20 per cent. reduction of their quota, and sold their lumber under the combination price, and thus the market was broken. Others in the association said, "Well, it is now every man for himself;" and the price has been gradually getting lower and lower, until now redwood lumber is being sold in San Francisco at less than the cost of manufacture and transportation. It is claimed that this state of affairs can be but temporary, and matters will sooner or later come back to a legitimate business basis—with some manufacturers many thousands of dollars out of pocket. The best informed manufacturers of lumber tell us the demand is quite up to the average, and if it had not been for the circumstances above related, the lumber trade would now be as good as it has been at any time within the last three years. There is a slight dullness at present in the foreign demand for what is known as large, rough, clear, suitable for export. This latter is a branch of the redwood lumber trade, which is supplied almost exclusively by Humboldt County, and renders her manufacturers independent of the home market to a considerable extent. Our lumber dealers feel the effect of the temporary depression in the California market, but take a hopeful view as to a readjustment of prices and better times.

MODERN FLATS.—ELEVATION OF A DESIGN COSTING $4,500.

Strength of Materials.

IT is possible, indeed it is probable, that man in the pre-historic ages was endowed with a superior and peculiar mathematical faculty, enabling him, without figures or geometric formula, to estimate cause and effect better than we. Again, the power required to elevate these gigantic stones to position in their temples seems at first glance to leave all our system of craner and other hoisting appliances far in the rear in point of power and efficacy, but when we take into consideration the facts proved by modern geological research, that the sites where these massive models of antique architecture are found, show unmistakable evidences of being once occupied by hills, the problem is not so difficult of solution, inasmuch as there are many reasons for concluding that before the foundations were laid, a lofty hill was selected, hollowed out, and the entire edifice, with i s massive lintels and domes, was erected on the inside; thus the heavy and light substances were elevated by means of the hill's incline, taken to the top, and from there placed in position, and when the structure was completed, the hill was raised, and the building appeared as represented to-day in the crumbling mass of ruins found throughout Egypt and Asia Minor.

Again, architects who have had the good fortune to visit these places have wondered at and admired their arches, placed in position at a time when levels, squares and equilibriums were supposed to be unknown, and the laws of frictional contact and pressure unheard of. At the present time their investigations are conducted with the greatest difficulty, notwithstanding the fact that the most eminent mathematicians of the age have striven to render the solution easier by introducing certain pre-supposed conditions; thus, in the published treatise on nearly all their architectural theories, from the standpoint of the mathematician, the structures of arches and curves are regarded as consistng of *courses of stones* resting on the abutments, and carrying a load which is supposed to press only in the direction of their imaginary lines. Then, again, cohesion and friction are often entirely ignored in the calculation of pressure and strength of the materials used; in short, many investigations are conducted upon the supposition that the materials could slide freely upon each other.

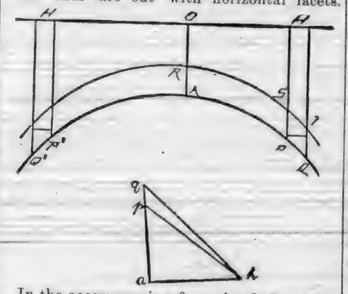
It has been proven, to the satisfaction of the more advanced school of architecture, that if the line of pressure of one stone against another, for instance, cross their mutual surface perpendicularly, there is no tendency to slide; hence if this known knowledge of physical conditions be observed throughout the entire structure, complete stability and permanence of position must ensue, inasmuch as the entire friction and consistency of the cement contributes to this attainment.

In the light obtainable from this, it is plain to be seen that if, in any case, this line of pressure should cross the mutual surface obliquely, the tendency to slide by this pressure must be counteracted by the cohesion of the particles constituting the materials used, and by so doing the actual firmness of the structure would be impaired.

Now if an investigation is conducted on the supposition that the cohesion of particles is to be ignored, then we are led to the best possible construction. The best authorities on this matter do not recognize the pertinency of the conclusion based on the hypothesis that the superincumbent load presses only downwards in accordance with the course prescribed by this lien alluded to in the foregoing. In order to place such a supposition in accordance with the facts of the case of arches, the inner ends of the arch-stones would have to be dressed with horizontal facets for the purpose of receiving and transmitting the downward pressure. But if, as is usually the case, the inner surface be oblique, they cannot transmit a vertical pressure unless in accordance with the law of cohesion, besides which this hypothesis of only downward pressure on the arch-stones is at variance with the fundamental principles of stability; hence in a thorough investigation, this hypothesis must be ignored, and the oblique pressure on the inner ends must be taken into account and the force recognized.

In view of the fact that the depth of these arches is small as compared to the dimensions of the structure as completed, and since the lien of the pressure transmitted from one to another must always be *within* that depth, it is reasonable to suppose that, for the purpose of analyzing the strain, that they form an exceedingly thin course, and that their joints are everywhere normal as regards the divergence from the square. Eventually, however, this depth must be carefully considered and the importance recognized in our calculations.

As the most comprehensive manner to obtain a clear view of our argument, we will examine the following sketch, first assuming that the superincumbent load presses only downward on the arch-stones, or that their inner ends are cut with horizontal facets.



In the accompanying figure let Q' P' A P Q represent such an arch placed equally on the two sides of the crown A, then the entire weight of the structure included between the vertical lines P' H' and P H must be held up or supported at P' and P, so that the downward pressure at the point P must be the entire weight of the structure imposed over A P. This pressure downward is accompanied by a tendency to separate the supporting points P' and P; thus, as this tendency is horizontal, its intensity cannot be changed by the load acting only downward, and must remain the same throughout the structure, whereas the actual pressure at p must be found by combining this stable or fixed horizontal thrust with the downward pressure equal to the weight of the bridge from A to P. In view of this if we draw a h horizontally to represent this constant thrust, and a p upwards to represent the weight of this portion of the arch, the line p h must, in accordance with the law governing the composition of pressures, indicate both in direction and in intensity the actual strain at the point P; this pressure must be perpendicular to the *joint* of the stones, and therefore must be parallel to the straight line drawn to touch the arch at P.

By virtue of the foregoing, if the form of the inside of the arch, or the *intrados*, be prescribed, it is easy to discover and estimate the power of the law of the pressure and its various parts; thus we may find the strain at the point Q by simply applying there a tangent to the curve, and to draw h q parallel to the same; h q represents the oblique strain at Q; a q represents the entire weight from the crown A to Q, and therefore p q is proportional to the weight imposed upon the portion P Q of the arch.

So long as the structures are confined to small dimensions, it is not necessary to incorporate such nicety and technical mathematical calculations in our calculations, inasmuch as in adaptation of the parts the friction of the surfaces, and the cohesion of the mortar are sufficient to compensate for any impropriety of arrangement. The great aim and object of Americans at the present time seem to be very large and massive structures. In eligible, desirable locations, ground surface is scarce and dear, and unlike some of the larger European cities, our workers will not, at least do not, labor below ground; the air and space above to infinity belong to the purchaser of the plat, hence we are building high and massive structures—not too high or too massive by any means—but to avoid these mysterious and fatal catastrophes that occasionally shock the entire country, attention must be paid to these minor and minute technicalities suggested in the foregoing.

The strength and intensity of these various strains must needs be carefully considered. The strength from all attainable standpoints of the materials used are within the reach of all, and before the Architects of America can hope for a full realization of their rising hopes and anticipations to acknowledge no superiors in older countries, or among prehistoric ages, they must master these laws governing strengths, pressures, and strains in all phases; then, and not till then, ages yet unborn will wonder and admire the achievements of the Architects of this, the nineteenth century, the boasted era of civilization and a high order of faculty development.

Our Illustrations.

THE elevation and plans of a modern flat, costing $4,500, will be found on pages 57, 59 and 61. The plans are sufficiently plain to give any one a thorough idea of the arrangements of rooms, etc. Sizes are distinctly marked, as well as the various accommodations usually found in houses of the character shown.

Business Changes.

THERE have been quite a number of changes in the location of Architects during the past few weeks, the principal of which are the following:—

Albert Pissis & W. P. Moore have formed a partnership. Their office is located at 217 Sansome.

Bennett & Curtis have dissolved partnership, the latter retaining the old offices at 528 California; Mr Bennett may be found at 431 California.

H. D. Mitchell has moved to 126 Kearny, corner of Sutter.

Newsom & Gash have dissolved partnership. Each retains an office in the same building where they have been so long together.

T. D. Newsom, of Oakland, has formed a partnership with his brother, John J. Newsom, and they may be found at 431 California.

W. Mooser has moved to 334 Kearny, near Pine.

Swain & Cleveland have dissolved partnership. Each retains an office in St. Ann's Building.

The Building—Labor Market in San Francisco.

BRICK MASONS.

THE demand for journeymen brick-layers is, and has been such for months past, as to absorb the entire supply of good hands, on brick buildings and the better class of work. Every knight of the trowel worthy the name, is employed, with well-assured prospects of continuance the season through. The outside, second-rate men, both as contractors and journeymen, are also generally employed on light foundations, chimney work, etc.

CARPENTERS.

Notwithstanding the large number of buildings under way, the supply of journeymen carpenters is easy, some not being able to find more than temporary employment. This is owing to the great influx of men from other parts of the country, attracted hither by the reports of a "building boom" in San Francisco. The entire resident class of good workmen, and many of more recent coming among us, are steadily employed, with fair prospects for months to come; but with the probability that there will be some letting up in building activities before the close of the year,—a prognostigation based upon the fact that the number of buildings erected in the recent past, has been greater than the increase in population, and the demand for houses,—consequently the "To Let" signs, which are becoming numerous, will be apt to check the ardor of some who would otherwise build as an investment, or for personal or speculative purposes.

PLASTERERS.

As a matter of course, these also, as a class, are full of work, and frequently difficulties are encountered in this branch of house building, not so much on account of insufficiency in number, as in the moral status and habits of the workmen, many of whom love the overflowing mug—of beer—more than they do the development of muscle, through the masterly use of the trowel.

The Lathers, a distinctive branch of the plastering work, very often cause delay, by demands for higher pay, or deliberate refusal to do anything for one or several days consecutively, as the result of "pure cussedness," a disregard for their own, their employers', or the owners' interest.

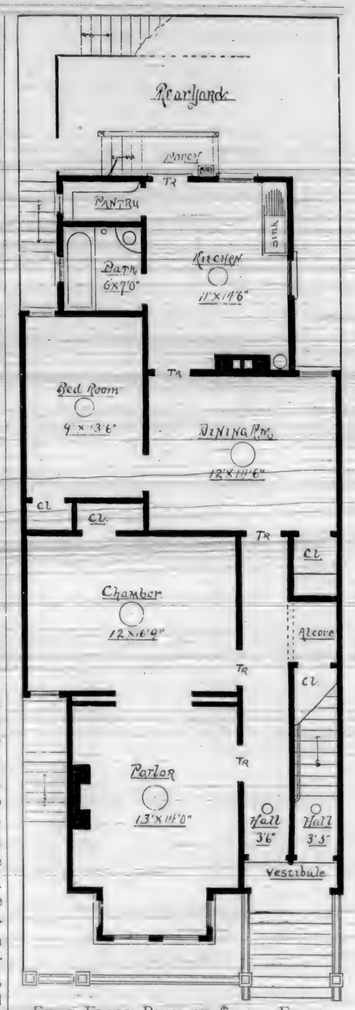
GENERALLY.

With existing lively times, all—painters, plumbers, and all others engaged in building pursuits—are correspondingly busy, and will so continue until the "letting up" times come, with this as a future result, that the best men mechanically and *morally*, will be continued, and those less skillful as workmen, or otherwise faulty, will have to meet the discomforts and misfortunes of non-employment.

Death-Dealing Dish-Cloths.

"I HAD some neighbors once—clever, good sort of folks. One fall four of them were sick at one time with typhoid fever. The doctor ordered the vinegar barrels whitewashed, and threw about forty cents' worth of carbolic acid into the swill-pail and departed. I went into the kitchen to make gruel. I needed a dish-cloth, and looked about and found several, and such 'rags'! I burned them all and called the daughter of the house to get me a dish-cloth. She looked around on the tables. 'Why,' she said, 'there were about a dozen here this morning;' and she looked in the wood-box and on the mantle-piece, and felt in the dark corner of the cupboard. 'Well,' I said, 'I saw some old, black, rotten rags lying around, and I burned them, for there is death in such dish-cloths as these, and you must never use such again.'

"I took 'turns' at nursing that family for four weeks, and I believe those dirty dish-cloths were the cause of all that hard work. Therefore I say to every housekeeper, keep your dish-cloth clean. You may wear your dresses without ironing, your sun-bonnets without elastics, but you must keep your dish-cloths clean. You may only comb your hair on Sundays; you may not wear a collar unless you go from home; but you must wash your dish-cloth. You may only sweep the floor when the 'sign gets right;' the windows don't need washing; you can look out at the door; that spider-web on the front porch don't hurt anything; but as you love your lives, wash out your dish-cloth. Let the foxtails get ripe in the garden (the seed is a foot deep any way); let the holes in the heels of your husband's stockings go undarned; let the children's shoes go two Sundays without blacking; let two hens sit four weeks on one wooden egg; but do wash your dish-cloths. Eat without a table-cloth; wash your faces and let them dry; do without a curtain for your windows and cake for your tea, but, for heaven's sake, keep your dish-cloths clean." ONE WHO KNOWS.



FIRST FLOOR PLAN OF $4,500 FLATS.

Readers of the "CALIFORNIA ARCHITECT" will confer a favor upon the publishers, and derive material benefit themselves, by mentioning this paper when opening correspondence with advertisers. Drop us a postal card when you have written to an advertiser, give us his name, and then we will put you in the way of getting the benefit. Don't forget this.

She Wanted a Bracket.

TO BEGIN with she had two vases and a clock. There was no room for them on the bureau, and the table was full. So it happened she wanted a shelf whereon the vases and the clock could be disposed. There was just the place for a shelf between the windows. She measured the space and gave the carpenter an order for a board twelve inches wide, four feet long, and three-fourths of an inch thick. The carpenter offered to put it up with nice iron brackets costing fifty cents a pair, but she said him nay. Such cast iron horrors were inartistic. She would have it all of wood. Had she not a scroll saw? Was she not mistress of hammer and screw-driver? She would make her own bracket for sweet economy's dear sake and her own delight.

Straightway she drew upon paper a design for a sweet thing in brackets. Procuring a piece of clear pine, half inch stuff, she cut out the design upon it with her scroll saw. It was, indeed, a lovely bracket, and she at once made another, polished and sand-papered the pair, and gave them a coat of shellac just for color's sake. She then put a screw through each into the wall and laid the shelf upon them. This is the result: Fig. 1.

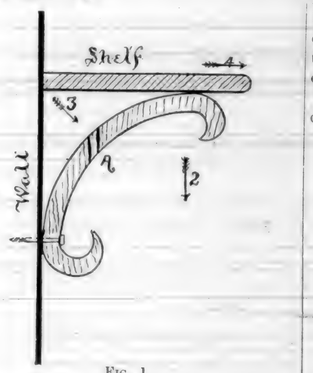


FIG. 1.

The bracket showed a sense of beauty without knowledge. Common sense suggested the placing of the screw at the point shown, near the end of the bracket. Experiment proved that the whole thing was unlovely and inartistic because not founded on the nature of things. The bracket had the beauty of form in a certain bookish way. It was just like the things in the drawing books. It had, also, the inherent beauty of color, because the natural color of the wood had been preserved, yet these things were of no value because the bracket was useless.

She laid the shelf on the brackets, and it at once tipped up, having no support next the wall. She thought this could be remedied by placing a strip of wood under the shelf against the wall. This worked very well, though it did not look quite right. Then she piled a quantity of books on the shelf to see if its factor of safety was within the probable weight of the clock and vases. Both brackets broke off at the point A, and the whole thing was ruined.

At once she went out-of-doors, found a good tree, and sat down to consider the branches thereof. And this is the sum of her consideration: If any one had laid a beam of wood from the main stem of the tree to the branch, say for the purpose of making a support for a swing or for a ladder to gather the fruit, the branch would be essentially a bracket. The beam, like the shelf, would be a lever with the fulcrum at one end. The branch would resist the downward thrust of the lever at the point where it was most needed. So would the bracket—with this difference—the branch resists the thrust in line of its greatest strength or along the grain; the bracket met the thrust in the direction of its weakest point, across the grain. It was also another lever tending to transform the thrust into a transverse strain.

Referring to the bracket, she saw in her mind's eye three strains. First, the tendency of the upper part of the bracket to move outward in the direction of arrow 1. Then there was the thrust downward, arrow 2, due to the weight of the shelf, and lastly there were the two combined that made the breaking strain, shown by arrow 3, in the diagram. Moreover the carved ends of the bracket did not in any way help to support the shelf; they were liable to be broken off, and consequently were inartistic and valueless.

The result of her considerations was a new design for a bracket. Fig. 2.

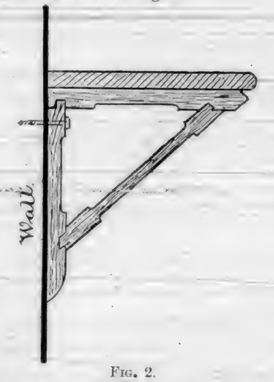

FIG. 2.

At first it appeared painfully stiff and plain. However it worked, so to speak; it could hold up the shelf with ten times the load that would ever be put upon it. Its factor of safety was as ten is to one. Besides this there was only one screw in the wall, and placed where it would be out of sight.

The bracket was composed of three parts, and each, like the branch of the tree, cut out in the line of its greatest strength, or along the grain. The first, or wall piece, was placed upright and had a tenon at the top and a mortise in front near the bottom. This was held to the wall by one screw placed near the top. Why? For two reasons. The tendency of the bracket is to fall under the weight of its load. There is also the tendency to fall outward, because the shelf acts as a lever. If the screw had been put at the lower end of the stick, it would form a pivot on which the bracket would tend to fall outward. By placing the screw at the top it resisted both the downward thrust and the tendency to fall outward.

These things refreshed her mind. It seemed as if she were dealing with the everlasting verities of constructive art. The two remaining members of the bracket had equally important parts to play. The horizontal piece at the top supported the shelf, and, being anchored to the wall-piece by the mortise and tenon, it served as a stay to prevent the bracket from falling outward. It was a tie and resisted the pull of the shelf outward. It was also mortised to the end of the third member, that served to transfer the weight of the end of the shelf to the wall-piece. In this last member the duty is to resist a thrust and to support the shelf by transferring its weight to the wall. This member was also mortised into the wall-piece.

The brackets were a success. Severe in their outline, they still had undeniable beauty. With her knife she cut away the edges in places and made incised ornaments here and there. This took away the square-edge appearance of the work and added a measure of ornament—not much, to be sure, because the whole thing was merely a bracket. It suggested the tree form, the stem and branch. It was fitted to its work and performed it well, because properly designed.

Straightway she placed the vases and the clock on the shelf, and some books and a lamp and other things, and even the baby, when, one day, the nurse upset the bath-tub. Baby sat there for five minutes in mingled comfort and safety, and the bracket did not show signs of distress. Then she considered the thing in a deeper sense.

The bracket was strong, simple, and well designed, and, as a result, artistic. It was truthful, and did not pretend to be what it was not. It might have been turned in a lathe or covered with ornaments, and so long as it preserved the underlying ideas expressed in its present simple form, it would be correct. The moment it departed from these principles it would be inartistic, however ornate, or whatever its material.—*Charles Barnard, in Decorator and Furnisher.*

Safest Way to Use Whisky.

PROCURE any certain quantity of whisky. Into a wide-mouth demijohn, place a quantity of glue; pour the whisky into the demijohn, and put the vessel away for about five days; See that the cork fits tightly. After the expiration of the above time, you will have a superior article of liquid glue, with which broken furniture, etc., can be mended.

Bound Volumes of this Journal Now Ready. Price, Post-paid, $2.50.

Mechanics in Education.

SEEING and feeling are two senses which are more important in aiding to a knowledge of our surroundings than any others, and yet their education is generally neglected until the possessor begins to learn something of mechanics. By mechanics in this connection is intended any attempt to contrive, put together, manufacture or change by manipulation, so that a woman who contrives and fashions a dress out of the unformed and plain material, may be a mechanic. The use of mechanical tools cannot be begun too early in life, whether the pupil is to be a practical mechanic or to follow some other calling—there are few vocations that do not demand for success some practical knowledge of mechanics. "The whittling Yankees" possibly owe much of their undisputed position as inventors and good mechanics to the habit of using a pocket knife. A very prominent inventor and superior mechanic recently remarked that the bent of his taste as a mechanic was undoubtedly given by his schoolmaster, who was a carpenter and joiner, and who worked at his trade in summer and taught the district school in winter. If a boy did not possess a foot rule he made one for him from a shingle or constructed an inch scale. The foot rule and a pocket knife he considered necessary to a schoolboy's outfit, and he encouraged his pupils to estimate dimensions by the eye and then verify them by measurement. Wind mills and water wheels were parts of the pedagogue's training, and the click-clack of one or the other could be heard all about the school-house and on the borders of the brook in an adjoining field. Vanes cut from pine boards, toy ships, bird houses, bows and arrows, pudding sticks, and most of the toys used by boys forty years ago were made by the schoolmaster's boys under his direction. To-day, beside the prolific inventor named, there are one superintendent of a railroad company, one bridge builder, one superintendent of a large manufactory, and two Architects to be counted from memory, who probably received their bent for mechanics from the carpenter schoolmaster.

All these lead lives of usefulness—they are producers, adding to the wealth and comfort of the country and the people; and nothing in their observation education makes them less valuable as members of society. One of the most distinguished orators was a blacksmith, and many men who are noted for their eminence in literature, divinity, law, medicine, and as educators, have had a mechanical training.—*Builder and Wood-Worker.*

Otis Elevators.

SPECIAL attention is called to this elevator now being successfully introduced into general use in this State. The cardinal principle of this elevator is different from that of any other in use, combining strength with simplicity, and more than the usual safeguards against accidents. They are manufactured by John Hammond, 42 Beale Street. Descriptive circulars sent on application.

Not from the Center of the Street.

PREVIOUS to October 1, 1884, it had been the custom with the gas companies to charge consumers for the cost of the service pipe, connecting the mains with the meter, counting the number of feet of such service pipe from the middle of the street. This rule we regard as just and equitable.

Since the above date, however, the companies—now consolidated, to all intents and purposes, into one—have agreed to charge for the actual number of feet of pipe laid, and the rate is made to cover cost of pipe, and an agreed upon cost of labor per foot of pipe laid.

This rule works a hardship upon property owners whose possessions lie on the side farthest away from the main. Take a street 60 feet wide; owners on one side have to pay for 18 feet, and those on the unlucky opposite, 42 feet. At 30 cents a foot, for 1¼ inch pipe, the figures will be $5.40 and $12.60. On wide streets, like Market and Van Ness Avenue, the disparity becomes even more marked.

The gas company claims that the rule now in force is more just to owners, because in the middle-of-the-street rule, they charged a much higher rate than they do under the present system. We do not know by what process of reasoning they arrive at this conclusion, but we do know that there is not a gas fitter in town but who would consider that he had struck a bonanza of the largest proportions if he could get numerous jobs where he could charge 30 cents a foot for 1¼ inch pipe, with as little trouble and expense as the connection of the mains with a meter.

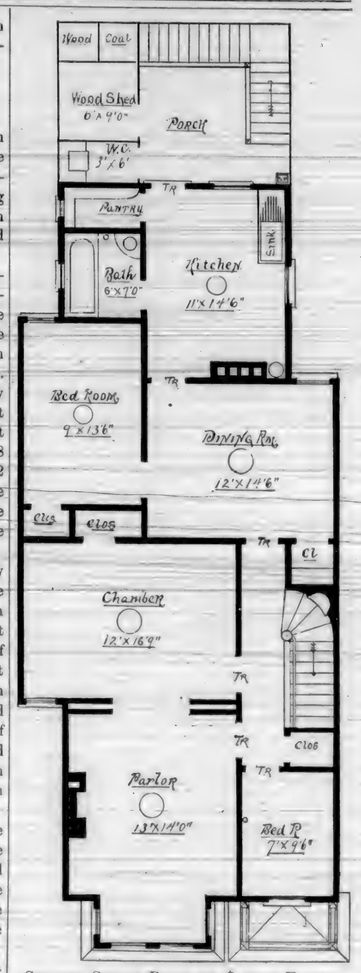
A just rule for the company to observe would be for them to furnish free to the edge of the sidewalk, the pipe and work connected therewith, and then let the owners of the property connect at that point, applying the same stringent test for its security that the law compels to the work inside the house.

When it is taken into consideration, the income derived by the gas company from the consumers of its manufacture, we consider that it should be their aim to reduce the first cost of connection with the mains to a minimum figure. If this policy were carried out, there would be less fault-finding, especially from those who own property on the opposite side of the street from the mains.

Putty.

DON'T you know that if a fire-place fails to draw, it is because your masons filled up the flue; that if the house settles, it's because you failed to use good cement in the foundations; and not because the Architect designed them too small? Don't you know that if sulphate of lime or magnesia blooms out on the face of pressed bricks, it's because your masons failed to do something or other—I don't know just what? And as for the rest of you, take the putty out of your own cracks and own up like men. Don't you plumbers know that scarlet fever and diphtheria were unknown till you and the doctors formed an alliance with the undertakers? Whether your carpenters confess it or not, we Architects know that the only way to keep wood-work from shrinking all to pieces is to catch and kiln-dry the carpenter—poor shrinking thing.

Of course you all do this mischief. Where would we Architects be if you didn't? Why, Architects would have their clients coming into their offices and holding them responsible for defects in their buildings, and then whom would the distressed Architect kick? Thus we discover another use for your putty—to support in the framework of your misdeeds the transparent purity of the flawless Architect.—*Architect John W. Root.*



SECOND STORY PLAN OF $4,500 FLATS.

THE SQUARE AS A FACTOR IN ARCHITECTURE AND GEOMETRY.

Paper Read before the San Francisco Chapter, A. I. A., by John Gash.

MR. PRESIDENT AND GENTLEMEN: I have taken for my papers to read before you this evening, the "Square as a Factor in Architecture and Geometry." That the square with the triangle and circle, form, as it were, the basis from which almost all other geometrical figures are formed, we are all of us aware, nor is it to be wondered at that the circle and triangle should form the basis from which the early architects should draw their outlines and figures as nature set the example, the earth, the sun, with the trees of the forest, all having the circle for their bases. The starry firmament have the triangle, but nowhere do we find the square except in the human form, where a man's arms, extended from tip to tip of his fingers, are equal to his height. The birds have taken the circle for the universal form of their houses, and the bee has adopted the hexagon. To man, then, alone, do we look for the square in his designs for buildings. Why it should be remains so far to the world a mystery.

While the ruthless hand of time has destroyed all chains of past ages to show that mankind in different countries had a sort of affiliation with one another, nothing is left to establish this fact but architecture. How happy should those feel who do their part to continue that chain that was first forged by Tubal Cain, and ever since continued to the present day, despite war, famine, pestilence, and the ever-changing destinies of nation—to you, my brothers, is this handed down. I trust you will pass it along, so that when you are laid in the silent dust, and perchance no mention made of your name, the architects of future generations may look with pride at those who lived in the nineteenth century. History fails to tell us that Greece, Rome, Egypt, Persia, India, China, Babylon, Mexico, the Aztec nation, England, Italy, Peru, were all at some remote period known to one another. The architecture of those countries alone establishes the fact, and the most particular part of that which each of the above countries have adopted, is the square. I will briefly refer to a few of the buildings to be found in those countries which I refer to, that have taken it for a basis. The Jewish people of Palestine, and the Druids of England, have given us the square and circle as the basis of their architecture in the buildings erected to their form of worship, the temple of Jerusalem erected by King Solomon, and the house of the forest of Lebanon by the former, and the stone henge by the latter.

Beginning with Greece we find that, as a rule, her temples were built in the form of a double square, the length being equal to twice the breadth.

The temple of Juno, erected at Samos about 540 B. C., the Temple of Jupitor at Selinus, the Temple of Jupiter Olympus in Sicily, and the Parthenon of Athens are each and all built on the principle of the double square.

Leaving Greece and entering her rival sister, Rome, we find her religious and public buildings partaking of the quadrangular shape, nor is this to be wondered at, as many of them were erected under Grecian Architects, who found Rome a more remunerative field for their labor, more especially after Greece became a Roman province, about 145 years before the Christian era.

The square is most noticeably used in the Roman pantheon, its entire height being equal to its width, and, though being circular in plan in the details of the interior, the *square* is very much used, more especially in the paneling of its vaulted ceiling. In the Temple of Peace, also the Temple of Concord, the Roman Forum, the Temple of Jupitor Stator, the Palace of Diocleccan, at Spalatro, all have the square for a basis, and somewhat singular in the Temple of the Sibyl at Tivoli, which is of circular form, with, perhaps, the best example of the Corinthian columns to be found in any Roman temple of its time. The opening for doors and windows are two squares, their height being twice their width, a system adopted long afterward by the immortal Angelo, but somewhat slightly discarded in the nineteenth century. The Temple of Balbac, erected by the worshipers of the sun, being, perhaps, one of the most stupendous pieces of architecture ever erected to the "god of the day," assembled within its walls to hail that majestic circular orb, as he rose in his majesty above the eastern horizon, adopted the square for the outline of the shrine in which they should hail his first appearance and gaze on him as he traversed the vaulted canopy of heaven. Why this should be can only be conjectured because of the close relation that exists between that circular orb and the square.

The first traveler who describes this temple with accuracy is Maundrell, in his journey from Alepo to Jerusalem in 1697. The principal building, the temple, is of a rectangular form, being 3,600 feet long by 350 wide, with a portico 200 feet long by 100 wide, being *two* squares in length to one in breadth.

Perhaps, before referring to the architecture of Greece and Rome, I should have referred to that of Egypt, as this country, which may justly claim to be the *parent* of geometry, the fundamental principles of architecture, uniformity of plan characterizing all their work, never deviated from the right line and square. Their pyramids became the history of an age long past, telling of those wonderful structures referred to by Herodotus, Strabo, Plutarch and others. From these we learn that the great pyramids of Chrops were 800 feet square, running to a height of some 852 feet.

It would, indeed, be doing an injustice to attempt to give you any description of those pyramids in these papers, as that would make a complete subject in itself, which, I trust, some of you may read papers on at some future meeting. But my object was to show how the square was used as a factor in early architecture, and how, especially so, in the pyramids—nor was it less so in her temples, as we may see in those near Thebes, Carnac, and Luxor. The tomb of Osymandy, as we find, according to Diodorus, was a peristyleum 400 feet square, supported by animals 16 cubits high, each in one stone. As Egypt was, without a doubt, the parent of geometry, and the square, a natural outgrowth of the circle, in fact a reasonable consequence resulting from inclosing the circle by four lines, as well as *three*, the outgrowth of the triangle, which was held as a sacred figure by the Egyptians, it may reasonably be supposed that it would be adopted as a basis for their temples and tombs, and hence may be adopted by people who may have emigrated to other parts. Hence, we find in Persia, more especially in Persipolus, the same style and details in architecture as is to be found in Egypt. In the city of Ispahan, when visited by Chardin, in 1666, he describes their houses as being built with large square courts, surrounded with rooms of various dimensions, the sides of the area being planted with flowers and refreshed with fountains similar to the buildings to be found in Mexico at the present day.

Traveling into India we find history lost in trying to discover whence she derived her architecture; until within a late period it was supposed it was from Egypt. Sir William Jones, whose opinion seems to have been that the Indian temples and edifices are not of the highest antiquity, says that they prove an early antiquity, between India and Africa; that the structures of the early temples were pyramidal and partook of the form of a square, may be seen at Duogur and near Tanpore. There is also a pagoda of great antiquity near Posto Novo, on the Carromandel Coast, having within it a square court with a temple and pescina, to which is given the name of the Stream of Eternal Joy. There is also a temple of extraordinary size on the small Island of Scringham; it is composed of seven square inclosures, one within the other, the walls of which are 25 feet high and 4 feet thick. These inclosures are 350 feet distant from one another, making the outer walls nearly four miles in length, when we trace the square in general design of those Indian temples, whose antiquity history fails to describe. Leaving India we pass into China, whose history is buried as deep as that of India or Egypt. We find her architecture has certain features that make, as it were, a connection between her and those other countries I refer to, perhaps the most noticeable being the square.

The imitation of the tent is the true origin of their building, so that, from the accounts of travelers, a Chinese city looks like a large permanent encampment, as well in respect to its roof as its extent.

Yet while these are mostly of a circular form, the palaces and temples are built quadrangular, like the palace at Pekin, measuring

3,600 feet from east to west, by 3,000 feet from north to south. There is the pagoda, or Temple Ho-nany, measuring 590 feet long by 250 wide, and having with it buildings at its angles 30 feet square, and three pavilions 33 feet square; but perhaps the Great Wall of China is one of its most remarkable monuments, having towers on it at intervals of 200 paces measuring 40 feet square at the base, diminishing to 30 feet square at the top.

Leaving the Orient, feeling satisfied that the square, as a factor, was most usually adopted as the basis of their architectural monuments, we would take a passing glance at an equally ancient country, whose buildings are as great a mystery as those of Asia or Africa. While Prescott, in his history of Mexico, tries to describe its people, yet the antiquity of its architecture is lost in the sands of time, and its fundamental principles can only be traced in the use of the square in the general plan of its temples.

The edifices erected by the first inhabitants of Mexico for religious purposes were solid masses of earth of a pyramidal shape partly faced with stone. The great Pyramid of Cholula, the largest and most sacred temple in Mexico, appears at a distance like a natural conical hill wooded and crowned with a small church. Humboldt compares it to a square whose base is four times that of the place Vendome, in Paris, covered with brick to a height of twice that of the Louvre, the length of each side of its square base being 1,423 feet, and the height 177 feet.

In the northern part of Vera Cruz is found a pyramid of great antiquity measuring 80 feet square at the base, and nearly 60 feet high. The Tombs of Mitla are three edifices placed symmetrically in a very romantic situation. The number of separate buildings was originally five, and they were disposed with great regularity, having within them a court measuring 150 feet square. In Sonora, in the Gulf of California, on the banks of the Rio Gila, are some remarkable ruins known by the name of the Casa Grande, showing the remains of an ancient Aztec city, having many distinctive Egyptian architectural features, being quadrangular, with their sides facing the four cardinal points. From these we must conclude that the people had no means of modeling their ideas through study of the existing monuments of other nations, nor of preserving any traces of the style of building practiced by the race from which they originated.

It must be reasonably supposed that the vicinity of the continents of Asia and America is such that the arts and improvements must have been carried from one continent to the other. Having shown from a cursorary glance through the countries which I have above referred to, how the square formed a sort of connecting link in the several temples and monuments erected by each, though widely separated by time and distance, I will now occupy your time a little while in showing how it became a factor after the dawn of the Christian era in Europe. The cross, the emblem of Christianity, being taken as a basis for temples of worship erected to the founder of the Christian dispensation, buildings were erected after the style of the Latin and Greek cross, the former being six squares, the sides of a cube, giving one for the sanctuary, one for each transept, and three for the body or nave of the church, the Greek cross being five squares, one for each arm and one for the body of the building, both of these forming the basis of the several European cathedrals of the thirteenth, fourteenth, and fifteenth centuries, being lengthened in the nave more especially, as in the Cathedrals of Worms, the Church of Santa Maria Del Fiora vi Florence and several others.

Perhaps the best specimen of a church after the Greek cross is the church of St. Geneviere, in Paris, or, as it has since been called, the Pantheon, erected by Louis XV. But in all these the square has been uniformly followed by their Architects, not only in the general plan, but in their interior details, in their doors and windows, most conspicuously the quarter-foil, which, with the trefoil, was a characteristic feature of the early English style in church architecture, as also in the domestic architecture of Louis XIV. of France.

I have thus far shown you what a factor the square has been in architecture to form as if a continuous link in the great chain of our profession from the remotest period; while the work of the historian, the theologian, the scientist, has been lost in the sands of time, to the Architect alone has it been given the talisman that tells how past ages and nations must have intermingled with each other before the railroad, the telegraph, or telephone were even thought of.

In geometry it has of itself stood equally as conspicuous and alone as in architecture, never affiliating with its sister figures, the circle and triangle, save that, in the case of the circle, it condescends to admit of its four sides becoming a tangent to the circle when inscribed within it, and touching the circumference at its four angles when circumscribed round it. No nearer has any mathematician thus far been able to show what relationship one has to the other in point of area, though both may have the same diameter. The squaring of the circle has been an unsolved problem thus far, nor was any relationship in point of area found between itself and the triangle until Pythagoras found that a square described on its diagonal (which cut into two triangles) was equal to the sum of the square described on its other two sides.

It admits of being subdivided in itself without the aid of any other figure in geometry, and even then cuts up some funny pranks that were equally as mysterious as itself; thus, for instance, cutting a side into two equal parts the square of the whole line is four times the square of its half; cutting it into two uneven parts, the square of the whole line is equal to the sum of the square of the two parts and double the products of the parts. Again, dividing the side of a square into two uneven parts, the difference between the square of the two parts is equal to the product of the sum and difference of the parts. Thus you see the square is a mystery in itself; perhaps this is more especially the reason why man is said to act on the square with his fellow-man, being separate from all other beings or figures, and a mystery with himself; however this may be to us, as a Chapter of Architects, it has been transmitted, with its sides equal and angles true. Trusting we may so transmit it to future generations in our works and lives, I thank you for the attention you have given me on the square.

An experienced foreman, who has an eye for philosophy, says that tools apparently partake of the temper of those who use them. A short-grained man has nicked bits; the impetuous man, broken ones; the lazy man, dull ones; the careless man, badly dressed ones; the man with one idea, one dress for all kinds of work; the soft man can rarely keep the edge of a tool from turning, while the good-natured and even-tempered man has the best tools in the shop, and is pestered continually by ill-tempered workmen who come to borrow from him whenever they have a particular piece of work to do. It is quite interesting to note the similarity in the temper of workmen and their tools.

C. H. M. asks why a person will take cold quicker lying down on a bed than if sitting up—yet when they get into or go to bed, they are warmer than while sitting up.

Answer—If you are correct in your statement, it is probably because more vital energy is put forth by people who are not lying down, and in bed one is generally protected by additional clothing.

A Band saw for cutting marble is described in *Le Genie Civil*, which certainly merits mention. Every one knows that the saws ordinarily used for cutting marble or hard stone, which consist of plain steel blades, fed with sand, lose much of their efficiency by the filling of the cut with a paste of finely ground sand and stone, so there is a certain advantage in working with a vertical saw which does not accumulate pulverized stone beneath it. The difficulty in employing a toothed saw-blade lies, however, in the rapid wearing of the teeth, by which the blade is soon reduced to a smooth ribbon of steel. To prevent this, the new saw is provided with an accessory in the shape of a grooved wheel of hardened steel, which is set at right angles with the saw-blade, and engages with the teeth of the saw. This grooved wh el is made to press so firmly against the blade as to notch it, thereby reviving the teeth as fast as they are worn down. The teeth are of course rather rudely formed, and are left with a large "burr," but this seems to help the cutting action, by making more room for the blade in the cut. In practice this saw is operated at a very high velocity; and although we have no statement of its efficiency, it seems quite possible that it will be useful.

The New Mechanics' Lien Law, Approved March 18, 1885.

THE new law in regard to the enforcement of mechanics' liens, having received the signature of the Governor, is now in operation. It should be carefully read by every owner, Architect, and contractor, as its provisions are essentially different from the law as it formerly stood upon the statutes. We give the law in full as we receive it direct from the authorities at Sacramento:—

CHAPTER CLII.

An Act to amend sections eleven hundred and eighty-three, eleven hundred and eighty-four, eleven hundred and ninety-one, eleven hundred and ninety-four, and eleven hundred and ninety-five of an Act of the Legislature of the State of California entitled "An Act to establish a Code of Civil Procedure," approved March 11, 1872, and to add four new sections thereto, to be known, numbered, and designated as sections twelve hundred, twelve hundred and one twelve hundred and two, and twelve hundred and three, all relating to liens of mechanics and others upon real property, and to carry out the mandate of section fifteen of article twenty, of the Constitution.

[Approved March 18, 1885.]

The People of the State of California, represented in Senate and Assembly, do enact as follows.

SECTION 1. Section one thousand one hundred and eighty-three of the Code of Civil Procedure is hereby amended so as to read as follows:—

1183. Mechanics, material men, contractors, sub-contractors, artisans, Architects, machinists, builders, miners, and all persons and laborers of every class, performing labor upon or furnishing materials to be used in the construction, alteration, or repair, either in whole or in part, of any building, wharf, bridge, ditch, flume, aqueduct, tunnel, fence, machinery, railroad, wagon road, or other structure, shall have a lien upon the property upon which they have bestowed labor or furnished materials, for the value of such labor done, and materials furnished, whether at the instance of the owner, or of any other person acting by his authority, or under him, as contractor or otherwise; and any person who performs labor in any mining claim or claims, has a lien upon the same, and the works owned and used by the owners for reducing the ores from such mining claim or claims, for the work or labor done, or materials furnished by each respectively, whether done or furnished at the instance of the owner of the building, or other improvement, or his agent; and every contractor, sub-contractor, Architect, builder, or other person having charge of any mining, or of the construction, alteration, or repair, either in whole or in part, of any building or other improvement as aforesaid, shall be held to be the agent of the owner, for purposes of this chapter. In case of a contract for the work, between the owner and his contractor, the lien shall extend to the entire contract price, and such contract shall operate as a lien in favor of all persons, except the contractor, to the extent of the whole contract price; and after all such liens are satisfied, then as a lien for any balance of the contract price in favor of the contractor. All such contracts shall be in writing when the amount agreed to be paid thereunder exceeds one thousand dollars, and shall be subscribed by the parties thereto, and shall, before the work is commenced, be filed in the office of the County Recorder of the county, or city and county, where the property is situated, who shall receive one dollar for such filing, otherwise they shall be wholly void, and no recovery shall be had thereon by either party thereto; and in such case, the labor done and materials furnished by all persons aforesaid, except the contractor, shall be deemed to have been done and furnished at the personal instance of the owner, and they shall have a lien for the value thereof.

SEC. 2. Section one thousand one hundred and eighty-four of the Code of Civil Procedure is hereby amended so as to read as follows:—

1184. No part of the contract price shall, by the terms of any such contract, be made payable, nor shall the same, or any part thereof, be paid in advance of the commencement of the work; but the contract price shall, by the terms of the contract, be made payable in installments, at specified times, after the commencement of the work, or on the completion of specified portions of the work, or on the completion of the whole work; *provided*, that at least twenty-five per cent. of the whole contract price shall be made payable at least thirty-five days after the final completion of the work and contract. No payment made prior to the time when the same is due under the terms and conditions of the contract, shall be valid for the purpose of defeating, diminishing, or discharging any lien in favor of any person, except the contractor, but as to such liens, such payment shall be deemed as if not made, and shall be applicable to such liens, notwithstanding the contractor to whom it was paid may thereafter abandon his contract, or be or become indebted to the owner in any amount, for damages or otherwise, for non-performance of his contract or otherwise. As to all liens, except that of the contractor, the whole contract price shall be payable in money, and shall not be diminished by any prior or subsequent indebtedness, offset, or counter-claim in favor of the owner and against the contractor; no alteration of any such contract shall effect any lien acquired under the provisions of this chapter. All such contract and alterations thereof as do not conform substantially to the provisions of this section, shall be wholly void, and no recovery shall be had thereon by either party thereto; and in such case the labor done and materials furnished by all persons, except the contractor, shall be deemed to have been done and furnished at the personal instance of the owner, and they shall have a lien for the value thereof. Any of the persons mentioned in section eleven hundred and eighty-three, except the contractor, may, at any time, give to the owner a written notice that they have performed labor or furnished materials, or both, to the contractor, or other person acting by authority of the owner, or that they have agreed to do so, stating in general terms the kind of labor and materials, and the name of the person to or for whom the same was done or furnished, or both, and the amount in value as near as may be, of that already done or furnished, or both, and of the whole agreed to be done or furnished, or both. Such notice may be given by delivering the same to the owner personally, or by leaving it at his residence or place of business, with some person in charge; or by delivering it to his architects, or by leaving it at their residence or place of business, with some person in charge; or by posting it in a conspicuous place upon the mining claim, building, wharf, bridge, ditch, flume, aqueduct, tunnel, fence, machinery, railroad, wagon road, or other structure. No such notice shall be invalid by reason of any defect of form; *provided*, it is sufficient to inform the owner of the substantial matters herein provided for. Upon such notice being given, it shall be the duty of the owner to and he shall withhold from his contractor, or from any other person acting under such owner, and to whom by said notice the said labor or materials, or both, have been furnished or agreed to be furnished, all money due or that may become due to such contractor, or other person, or sufficient of such money to answer such claim and any lien that may be filed therefor, for record, under this chapter, including costs and counsel fees provided for in this chapter, until such notice is by writing withdrawn; and all money paid thereafter by the owner to the contractor, or such other person, while such notice is in force, shall, for the purposes of all leins of all persons, except that of the contractor, be deemed a payment prior to the time the same was due within the meaning of and subject to the provisions of this section.

SEC. 3. Section one thousand one hundred and ninety-one of the Code of Civil Procedure is hereby amended so as to read as follows:—

1191. Any person who, at the request of the owner of any lot in any incorporated city or town, grades, fills in, or otherwise improves the same, or the street or sidewalk in front of or adjoining the same, has a lien upon such lot for his work done and materials furnished.

SEC. 4. Section eleven hundred and ninety-four of the Code of Civil Procedure is hereby amended to read as follows:—

1194. In every case in which different liens are asserted against any property, the Court in the judgment must declare the rank of each lien, or class of liens, which shall be in the following order, viz.:—

1. All persons performing manual labor in, on, or about the same.
2. Persons furnishing materials.
3. Sub-contractors.
4. Original contractors.

And the proceeds of the sale of the property must be applied to each lien or class of liens in the order of its rank; and whenever, in the sale of the property subject to the lien, there is a deficiency of proceeds, judgment may be docketed for the deficiency in like manner and with like effect as in actions for the foreclosure of mortgages.

SEC. 5. Section one thousand one hundred and ninety-five of the Code of Civil Procedure is hereby amended so as to read as follows:—

1195. Any number of persons claiming liens may join in the same action, and when separate actions are commenced, the Court may consolidate them. The Court must also allow, as a part of the costs, the money paid for filing and recording the lien, and reasonable attorney's fees in the Superior and Supreme Courts, such costs and attorney's fees to be allowed to each lien claimant whose lien is established, whether he be plaintiff or defendant, or whether they all join in one action or separate actions are consolidated.

SEC. 6. Another section is added to the Code of Civil Procedure, numbered one thousand two hundred, and reads as follows:—

1200. In case the contractor shall fail to perform his contract in full, or shall abandon the same before completion, the portion of the contract price applicable to the liens of other persons than the contractor, shall be fixed as follows: From the value of the work and materials already done and furnished at the time of such failure or abandonment, including materials then actually delivered or on the ground, which shall thereupon belong to the owner, estimated as near as may be by the standard of the whole contract price, shall be deducted the payments then due and actually paid, according to the terms of the contract and the provisions of sections one thousand one hundred and eighty-three, and one thousand one hundred and eighty-four, and the remainder shall be deemed the portion of the contract price applicable to such liens.

SEC. 7. Another section is added to the Code of Civil Procedure, numbered one thousand two hundred and one, and reads as follows:—

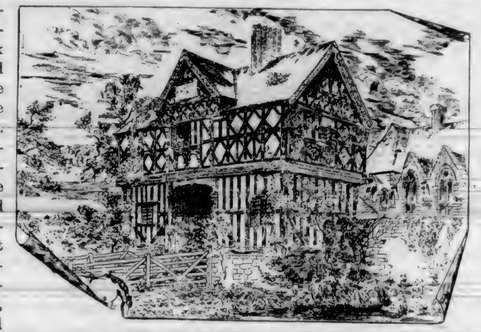
1201. It shall not be competent for the owner and contractor, or either of them, by any term of their contract, or otherwise, to waive, affect, or impair the claims and liens of other persons, whether with or without notice, except by their written consent, and any term of the contract to that effect shall be null and void.

SEC. 8. Another section is added to the Code of Civil Procedure, numbered one thousand two hundred and two, and reads as follows:—

1202. Any person who shall wilfully give a false notice of his claim to the owner under the provisions of section one thousand one hundred and eighty-four, shall forfeit his lien. Any person who shall wilfully include in his claim filed under section one thousand one hundred and eighty-seven, work or materials not performed upon or furnished for the property described in the claim, shall forfeit his lien. If the owner and his contractor shall directly or indirectly conspire to, or agree that, the written contract filed shall appear to show the contract price to be less than it really is, and it shall accordingly so show, then such contract shall be wholly void, and no recovery shall be had thereon by either party thereto, and in such case the labor done and materials furnished by all persons, except the contractor, shall be deemed to have been done and furnished at the personal instance of the owner, and they shall have a lien for the value thereof.

SEC. 9. Another section is added to the Code of Civil Procedure, numbered one thousand two hundred and three, and reads as follows:—

1203. Any bond which may be given by the contractor to the owner, for the faithful performance of his contract, shall be filed, with the contract, in the Recorder's office, or be void; and whatever may be its terms, shall inure to any person who performs labor for, or furnishes materials to, the contractor; and any such person shall have an action to recover upon said bond against the principal and sureties, or any or either of them, for the value of such labor and materials, not to exceed the amount of the bond; but such action shall not affect his liens, nor any action to foreclose it, except that there shall be but one satisfaction of his claim, with costs and counsel fees. Nothing in this section contained shall affect or impair the rights of the owner under the bond. Nor shall any alteration in the contract, or deviation in the work or in the payments, release the sureties on said bond from their liability, except to the owner.



NOTICE.

We have printed the above Lien Law on fine card-board suitable for hanging in offices. We will mail a copy to any address upon receipt of fifty cents.

Wood Turning.

IT seems like a very simple matter to come the free-hand act in paring down a piece of work in the turning lathe and bringing it up to a shining finish, if the careless manner in which the tools are held and the rate the cuttings fly, are anything to go by. The workman seizes a piece of stock, places it between centers while the lathe is still in motion, and the work starts off almost in its very central line of rotation, stirring up quite a breeze from the four corners of the square piece of stock, and just clears the rest from which the tools are to operate. The gouge sets in first and pares down toward the center, setting back each stroke for the length of chip, till the work is roughed out, when, with a few sweeps, the surface is left smooth and cylindrical. The parting tool reaches the lowest place in each hollow of any bead that is to be made to make room for the clearage of the cutting, and the gouge once more passes right and left from the brink of each bead, with a few delicate sweeps in the hollows, and the work is ready for the next piece, unless it is to be smoothed up with sandpaper held on the work while it is backed up with shavings to keep the hand from burning. This is where a business is made of the free-hand tool in wood turning, and there is no solid rest to work from. The tools rest as much on the work as on the bed of the lathe, and the stock is not torn to pieces by scraping with a chisel. There is a principle for every mishap that is to be found in any part of the process; if the gouge is being drawn forward with a lot of clearance beneath the cutting edge while the tool rests on the opposite side, an increasing spiral convoluted pitch may be attained contrary to expectations, though the principles of this action are as definite as the principles of falling bodies. If the squaring up is to be done with a chisel, where the bevel is on one side, there is every condition that is needed to strike out for parts unknown as soon as the cut leaves the extreme point in the cutting edge. Turning, like any other work, where we must cut across the grain, must have some means for the chips to leave, or they will cling to thrash on the rest, or to break into the finish of the work. It requires but a small effort to hold a tool in turning when it is held properly, but it will need the assistance of a tool post if the cutting edge is running in another direction, if a shearing cut is what is wanted. It will be well for those more acquainted in other departments to resort to scraping when in need of a mallet or a few handles for tools.—*Ex.*

Pine logs, taking the good, bad and indifferent together, will weigh on an average 8,000 pounds per thousand feet.

Questions and Answers for the Consideration of Students in Sanitary Science.

1. WHAT is the object of a trap?—To prevent sewer-gas from entering a house.

2. How is it effected?—By a water-seal, made by confining water in the bend of the trap.

3. Is this an effectual remedy?—Alone, no; because pressure will sometimes force air through the water.

4. Will the water in a trap absorb gas and emit it again?—Yes.

5. How is this difficulty overcome?—By leaving the end of soil-pipe open and making it easier for gas to ascend than to go through water.

6. Where should the open end of a pipe be situated, and how is the pipe usually terminated?—At the highest point of building, and finished with a bend.

7. What is the object of a trap where the soil-pipe enters the house?—To prevent, if possible, the entrance of sewer-gas to the house.

8. Is there any other theory on this point?—Yes: gas should not be confined to the sewers, but allowed to escape through numerous outlets.

9. What is the theory of the New York City Board of Health in regard to this?—That sewers should not contain gas, but as usually built they do.

10. What causes a pressure from the sewers on the main trap?—Difference in temperature between sewer and house, snow on openings and manholes, and tides blocking outlets and manholes.

11. Can the difference in temperature between the air in a sewer and in a soil-pipe unseal a trap?—Probably not.

12. Will open fires cause a suction on soil-pipes, and why?—Yes; they draw air from wherever there is the least resistance.

13. What is the best form of a trap at the outlet of a soil-pipe, and of what material should it be?—A running trap, with a manhole to clean it out.

14. Does a large body of water in a trap afford greater resistance to pressure from the sewer?—No.

15. What constitutes the resistance to pressure in a trap?—The depth of water-seal, not the amount of water in trap.

16. How deep should the water-seal be in a running trap?—About two inches.

17. What is meant by depth of water-seal?—The depth of curve or bend.

18. Is there any objection to a deep trap?—If too deep, matter will not be drawn out, but will remain and dissolve.

19. Why is a flap-valve not a good seal for a soil or waste pipe?—Matter lodging in pipe prevents its closing.

20. Why is the momentum of a column of water not likely to carry the water through a running-trap, and leave the trap unsealed?—Some of the water will usually run back, and the velocity is not sufficient to produce a vacuum.

21. What is the effect of a column of water passing through a pipe and completely filling it?—It causes a vacuum.

22. Why will a vacuum suck the air out of pipes?—Because the falling water drives the air before it, and by so doing causes a vacuum as it passes the branches and draws water out of traps.

23. What is the pressure of the atmosphere on a vacuum?—The greatest possible pressure is 15 lbs. on square inch.

24. How is this suction prevented?—By leaving top of soil-pipe open, so the air will follow the water.

25. Can a vacuum be created in a pipe when it is only partly filled with water?—To a certain small extent; generally, no.

26. What is the object of extending a pipe from the outer air to the soil-pipe just inside the trap?—To allow a current of air to pass through the pipe.

27. What difference does it make where this pipe enters a soil-pipe, so long as it is inside the point where the trap is placed?—It should enter near the trap, or the portion of drain between it and trap will form a dead-end.

28. What is the proper size of this ventilating-pipe?—Four inches.

29. Why does the air enter by this pipe, and pass out at the top of the soil-pipe?—The air in pipe being usually warmer than the air outside, causes an upward current.

30. Why does warm air ascend?—It is lighter than cold air.

31. Can a rush of water through the soil-pipe affect this ventilating-pipe, and should any precaution be taken in regard to it?—It should be placed as far as possible from basement windows, but if properly aired it should be free from gas.

32. Is it a good plan to ventilate a soil-pipe in a flue, and why not?—No; because when there is no fire there is often a down draught.

33. Would two traps where the soil-pipe enters the house be useful?—No; they would form an air-lock.

34. What is an air-lock?—Space in pipe where air is confined between two traps.

35. How does it affect the passage of water?—The confined air is like a cushion, and retards or stops the flow of water.

36. What is the objection to the use of a brick or stone box with a division-wall, known as a mason's trap, as a trap for a main soil-pipe?—It makes a small cesspool.

37. If a soil-pipe empties into a stream, or on the surface of the ground, and has no connection with a sewer or cesspool, is a trap useful?—Yes, if vented in the usual manner, because sewer-gas is generated in the pipe, and if the pipe is long it is better to trap it where it enters the house.

38. If a pipe empties into tide-water, what precaution should be taken to guard against air being forced through the trap by the pressure of the tides?—A line of vent-pipe between outlet and trap above the tide-level.

39. What is meant by the "dead end" of a soil-pipe?—An unventilated end.

40. Why are such ends dangerous?—Sewer-gas forms or collects in them.

41. How would you connect the leaders of a house with the soil-pipe?—By a deep-seal trap, so as to retard the evaporation of the water.

42. How would you connect area and yard drains with soil-pipes?—By suitable traps with house-drain, and always on the inside or house side of trap.

43. When traps are emptied of water to guard against freezing, in an unoccupied house or apartment, what precautions can be taken to shut out sewer-gas?—The traps can be filled with kerosene.

44. Is there any contrivance by which a soil-pipe can be regularly flushed?—Yes; by an automatic flush-tank.

Modern Æsthetic Houses.

"WE have from time to time called attention to the 'Crazy Style' of Architecture adopted by a few of our younger 'would be' architects. One of the principle '*ingredients*' of this style, is to cover the buildings, when finished, with a bountiful supply of paint, using more colors by far than the tailor who designed Joseph's coat, as described in the 'Good Book.' We quote the following remarks from that most excellent authority, *The Painter*, in regard to the style in question:"—

The existing craze for highly-colored houses, consisting almost entirely of chimneys and roof, will probably soon die out. There are symptoms that the public is becoming wearied of red tiling and dormers, and that inmates of "cottages," with every bedroom partly in the roof, and every sitting-room so low that a man standing on tip-toe can almost touch the ceiling, are sighing for lofty parlors and airy bedrooms. In those modern monstrosities which are considered old English because they do not fulfill the requirements of English speaking people of the present day, it is considered a beauty to be ugly. That bilateral symmetry, which is one of the greatest elements of beauty in art and nature, is sacrificed, not to necessity, nor yet to gain some grand effect, but in sheer wantonness. If a hall, by any accident, came in the center of a front, the entrance is placed to one side to produce an out-of-center effect. Mantels are thrown near the corner of a room, and the two sides made unlike, producing an effect like that of a motley clown.

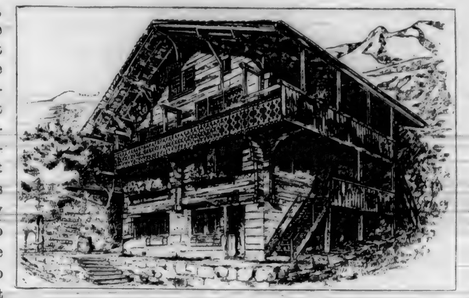
Not even the two halves of a door must be alike, a square panel on one half is balanced by an oblong one on the other. Strange little recesses, capital hiding places for vermin, abound. Glass is cheap, so the windows are cut up into paltry little panes, in base imitation of the times when woodwork was cheaper than glass. Walls are low and roofs are high, but there is no cheapness in the substitution of roofs for walls, for the bedrooms contained in the sloping surface have to be made square by furring, which reduces their size and renders it necessary, in order to reach the fantastic dormer window, to penetrate a deep recess like that which defended a woman's features in the days of the old poke bonnet. With all this there is a ridiculous tendency to divert materials to some purpose for which their fitness is not demonstrated. Shingles and roof tiles, used upon roofs from time immemorial, have crawled down upon the walls. The upper story and all the dormers are covered with them. Fond and foolish persons purchase houses so built. The perversion of shingles has gone further. The walls of rooms are not seldom lined with them, giving a sort of rustic summer-house effect. The straining after novelty or oddity, with total disregard of beauty, is evident in the color that is lavished upon the outside of houses. Red, yellow, chocolate, orange, everything that is loud is in fashion; and the entire exterior is so gay that a Virginia creeper or a Wisteria would be bold, indeed, if it dare set leaf or tendril there. If the upper stories are not of red or buff shingles or tiles, they are parted up into uncouth panels of yellow and brown, while cables and dormers are adorned, not with tasteful and picturesque designs, but with monotonous sunburs's and flaming fans done in loud tints.

It is easy to be odd, easy to be more odd than the oddest thing yet done. Why not at once reverse everything? As the shingles go inside, cover the outside with three-coat plaster, finished in colors; pave the parlors with North River flagstone, stretch the carpets on the porch floors, put the parlors in the roof, with an outside staircase to reach them; place the kitchen next to the front entrance, the bedrooms in the basement, and the furnace, servants' rooms, store-rooms, closets and bath-rooms on the first floor. All this is possible, and the oddity of the arrangement should recommend it to would-be æsthetes.

We find the following plain remarks in a new journal entitled the *Building Budget*, upon a subject that is of much interest to the architectural profession. We have noticed many items in our various exchanges in regard to the same matter, indicating that the custom in the Eastern cities has become a general one. Various remedies have been proposed, but it remains for our new Journal to propose a remedy somewhat bolder than those heretofore suggested.

COMMISSIONS TO ARCHITECTS.

"From time to time, through the columns of architectural journals, there have appeared indignant protests from architects against the dishonorable offers made to them by enterprising, but not over-conscientious, manufacturers and dealers of building material to accept commissions for the consideration of introducing and using their wares. It is but charitable to say that many firms are ignorant of anything dishonorable, since it is a common act of trade to pay commissions to the middle-man.



"But it is not infrequent, even in these days, after there has been so much said against the practice, to hear of some firm who will tender the architect a consideration, or at least suggest it, as an inducement to make use of his material. The honorable architect rejects it and treasures up in his heart a warm and healthy grudge against the man who has considered him vulnerable to a bribe. The dealer who offers it, not viewing the act upon the same moral level, imagines that the cold repulse given his offer betokens the fact that he did not bid high enough, and that some rival firm had raised him out of the sale.

"So long as there is trade and commerce there will be discounts and a sliding scale of prices gauged to the amount of the demand and the source the demand proceeds from. That architects should be able to control discounts is but just and right, but only to the benefit of their clients. If these firms, who are so ready to induce sales by the offers of questionable commissions, would change their tactics so far as to publicly state that sales made through an architect would receive a discount of a certain percentage, a client would understand that his architect's influence extended to that point that he, individually, was not able to reach in the items of cost; and, the quality and finish of goods being equal, the architect could congratulate himself that he was instrumental in producing work for an amount that none but those of his profession could control, while the material man, who has discounts to make could do so through the *proper* channel and to the legitimate party to receive it.

"In one of George Eliot's letters, as recently published, we find the following: 'When one sees a house stuck on the side of a great hill, and, still more, a number of houses, looking like a few barnacles, clustered on the side of a great rock, we begin to think of the strong family likeness between ourselves and all other building, burrowing, house-appropriating, and shell-secreting animals. The difference between a man with his house and a mollusk with its shell, lies in the number of steps or phenomena interposed between the fact of individual existence and the completion of the building.'

"Had George Eliot looked over the more aristocratic portion of our city she might have found another very marked difference, and that is in the veracity of the two. Whatever the mollusk's house pretends to be, it is; whatever our houses pretend to be, they are not. Too many of our most imposing edifices are conceived and brought forth in a mingled sentiment of affectation and pride. Marble fronts of pasteboard thickness, granite stoops and wooden columns, the massive stones, but mineral veneer, and the ornamentation, zinc-moulded shams, roughened with glue and sand, outward and visible signs of an inward and spiritual desire to seem, not to be. You see before you a palatial residence, its front an artistically-conceived design of a modern treatment of architecture, but unfortunately it stands by an alley, and exposes its side, brick, brick—good enough in its place, but as much in keeping as would be repairing a seal-skin sacque with coffee-bagging; while worse to come, penurious pride does not even stop here, but makes the back of the mansion of the severest plainness, of the poorest materials, and an utter shame to the ambitious display of the front."

Sub-contracts.

WE are now, and always have been, opposed to the system by which the several portions of a building are let by the original contractor to a person denominated a sub-contractor. Of course, the only object is, that the former, by this means, is enabled, perhaps, to make a little more money than if he did the work under his personal supervision. But while we are thus opposed to the system referred to, we are in favor of having a law passed by which a sub-contractor can get his money for the work done. We know of no better way by which owners can be protected than by the passage of a bill requiring sub-contractors and others, to notify owners of terms of contract under which they are working, and to report any delinquency on part of contractor to pay for work. Failure to so report should be made a misdemeanor, with certain prescribed penalties. If this course is pursued, the worry and annoyance caused by sub-contractors failing to receive their just dues, would become a thing of the past.

Question—"EDITORS CALIFORNIA ARCHITECT: Which do you consider the best works for an apprentice to obtain the greatest amount of information from in regard to the Science of Carpentry?"

Answer—There are several "*best*" works: "Science of Carpentry Made Easy;" "Tredgold's Carpentry;" "American House Carpenter," by Hatfield; "Practical Carpentry," by Hodgson; "Gould's Carpentry;" and the Bound Volumes of this Journal. In any of the above a student will find fully explained the principles of the Science of Carpentry.

The White Incrustation on Brick Walls.

It has been the source of much comment among those who watch the progress of our building interests, that more care is not exercised in the selection of clay with which pressed bricks are made. It is supposed by many that the fault is in the bricks. The following item from the *Manufacturer and Builder*, will be of interest to all concerned in the erection of brick buildings:—

"The disfigurement of brick walls in many Eastern cities with a white incrustation is most pronounced in the spring months, when the bricks become thoroughly saturated with moisture from continued rains. Two causes have been assigned to account for this circumstance:—

"(1) The existence of silicate, or other salt of magnesia, in the brick clay, and which is converted into sulphate of magnesia in the process of burning in the kilns by the sulphurous vapors from the coal; and, (2) the employment of lime containing magnesia for the mortar used in the walls, which, by the absorption of the sulphurous vapors derived from the burning of coal, becomes converted into sulphate of magnesia, and, being dissolved by the rain, penetrates the substance of the more or less porous bricks, efflorescing ultimately upon the surface.

The second of these causes is, undoubtedly, the principal one involved in the appearance of this unsightly incrustation. Brick-clay contains, as a rule, so trifling a percentage of magnesia that the supply of sulphate that it would form would soon be exhausted, and if it were not supplied from some other source, the incrustation would soon disappear. This other source, unfortunately, is present, and is found in the magnesian lime used in the mortar.

"Mr. Henry Pemberton, who was the first, we believe, to clearly point out the true cause of this phenomenon, at the same time called attention to the fact that the authorities generally are greatly in error in their statements respecting the quality of magnesian limes for mortar. Nearly all the text-books affirm that the presence of magnesia is injurious; that even 10 per cent. of it in the lime causes it to become lean (slow and difficult to slack); and that 25 or 30 per cent. makes it quite useless. These statements he shows conclusively to be misleading, and that such lime will slack readily. The behavior of the mortar made from such lime is very different from that made from pure lime.

"The lime used in and about Philadelphia, where the disfigurement of the walls is more pronounced, probably, than in any other city, contains, on an average, 57 per cent. of lime and 37 per cent. of magnesia, or nearly the relative amounts required for equal equivalents (or to form dolomite).

"This cement, Mr. Pemberton notes, contains 37 per cent., or nearly half of its weight, of a substance which is readily attacked, dissolved and formed into a soluble salt. In other words, every 100 pounds of such lime contains enough magnesia to form 230 pounds of Epsom salts—a crystallized sulphate of magnesia. It is not surprising, therefore, that such a cement, when brought into contact with the necessary quantity of sulphuric acid, should be disintegrated, washed out, and destroyed.

"That the universal use of coal in our large cities and towns for domestic and manufacturing purposes will, and does, furnish sulphuric acid in enormously greater quantity than is required to effect this destruction of the mortar, is well known to chemists. Mr. Pemberton gives a striking illustration of this fact. In the manufacture of carbonic acid on the large scale for the chemical industries, it is usually obtained by the combustion of coal, and purification by washings. To wash the gases resulting in twenty-four hours from the combustion in said time of 6,000 pounds of coal, 40 gallons of water per minute are sprayed into a tower through which the hot gases are passed. This water escapes from the tower at a temperature of 110° F., and consequently contains but little carbonic acid, yet it permanently and powerfully reddens litmus paper, and is perceptibly acid to the taste. As this process goes on continually, day and night, it appears that the sulphurous gases produced from the combustion of 3 tons of coal are sufficient in quantity to render distinctly acid 480,000 pounds of water. When it is considered, now, that the coal consumption of a great city will figure up to several thousand tons daily, it is not hard to understand that the quantity of sulphurous gases evolved therefrom will be vastly greater than is necessary to account for the phenomenon here under consideration.

"Mr. Pemberton sums up the evils resulting from the use of magnesian lime for mortar very concisely in the following terms, which are not in the least exaggerated: 'Unsightly and disfiguring as this white efflorescence may be, it is, to the owner of the building, the index to a more serious evil, namely, the disintegration of the mortar uniting the bricks, causing the destruction or fall of the chimneys and the washing out of the joints, particularly in the back walls or gable ends of houses, where the bricks are irregular in size and the said joints are consequently thicker. The cavities and open joints thus produced facilitate the destruction, until the retained moisture penetrates the wall and compels the owner to refill or repoint the joints at a heavy cost—the whole proceeding probably to be repeated after a few years.'

"These evils may be entirely obviated by the use of a lime free from magnesia. There is no dearth of such lime, but in many cases the prejudices of the workmen prevent its use; and in bringing this curious fact to light, Mr. Pemberton has, undoubtedly, placed his finger on the real difficulty, which will have to be overcome before the evils he so clearly elucidates can be done away with. This prejudice of the workmen he finds to be easily accounted for by the great difference in the behavior of mortars made from magnesian lime and from pure lime. Magnesian lime, he points out, in contradiction to most European authorities, forms, when slacked, a gelatinous, fatty mass, absorbing much water, and permitting a large amount of sand to be mixed with it. The bricklayer, when using it, spreads out the mortar on the surface of the brickwork already laid, as far as he can reach without removing his feet from their position. He then places the bricks in line upon this bed of mortar, placing, as he does so, a little mortar on the end of each brick as laid, until, perhaps seven or eight or more, are in place, then points up the brick with the trowel on the face of the work. With *pure lime* mortar this plan will not do. The mortar, when laid on the brickwork, becomes soon so firm—being less gelatinous, or *pasty*, than the magnesian—that two or three bricks only can be laid before it *sets*, or becomes so dry as not to make a proper bond with the new brick and those already laid. Consequently the bricklayer, accustomed to the magnesian lime, promptly and persistently rejects the pure lime as worthless, since he cannot execute the work expected of him in a given time, nor, probably, if used by him, would the bricks be securely and properly bedded.

"Mr. Pemberton proved, by personal experience, that this was so strong a local habit with the Philadelphia bricklayers that they rejected as unfit for use a mortar made of pure lime which he had brought to Philadelphia from the interior of the State of Pennsylvania especially with the view of doing away with the incrustation nuisance and its attendant evils. On the other hand, in other localities, as in Pittsburgh, the only lime available for building purposes is a nearly pure lime (containing at most from 5 to 6 per cent. of magnesia); and the bricklayers throughout all that section of the State, being accustomed to it, and knowing no other, use it with entire satisfaction. No incrustation on the walls occurs there, notwithstanding the enormous consumption of coal in the city and its vicinity.

"In view of the serious evils growing out of the use of magnesian limes—which have been very clearly pointed out in this article—and which are now well known and admitted, the abandonment of the use of this material would seem to be very desirable. How to overcome the prejudice of the workmen in its favor is the only difficulty in the way, but this appears to be a very serious one."

Furniture Polish.

The subjoined simple preparation is said to be desirable for cleaning and polishing old furniture. Over a moderate fire put a perfectly clean vessel. Into this drop two ounces of white or yellow wax. When melted, add four ounces of pure turpentine, then stir until cool, when it is ready for use. The mixture brings out the original color of the wood, adding a luster equal to that of varnish.

BOUND VOLUME OF THIS JOURNAL, $2.50.

The Chapter Should Have a Home of Its Own.

In a report received at the last meeting of the San Francisco Chapter, A. I. A., it was intimated that the best way to advance and cause an interest to be felt in the Chapter, particularly so by apprentices and draughtsmen in the various offices, was by the furnishing of a suitable room which would be recognized by parties interested, as a home.

This idea is a worthy one, and should be immediately carried out by the Chapter. A room should at once be secured and properly furnished. All the different journals and periodicals referring to architecture, carpentry, modeling, decorating, etc., should be kept on file. A room should be conveniently near in which a work bench could be placed, in order that *practical* lessons may be demonstrated in the various callings.

We understand that a prominent capitalist of this city, has offered to give a room free of charge for the purposes indicated. If so, the Chapter should at once take measures to secure the same and have it properly fitted up, so that all connected with the profession, and visiting brethren from the East, while in the city, can feel that there is one place where they will be at home, and find all those little comforts so necessary to the welfare of all true lovers of the architectural profession.

Building Contracts.

When a building must be speedily completed, it is generally easier to attain that object by putting the whole contract into the hands of one man. Two contractors, responsible only to the owner, and jealous or indifferent in regard to each other's interests, always charge each other with the responsibility for the delays which usually occur under such circumstances, and the owner finds it difficult, if not impossible, either to enforce his contract as to time of completion, or to collect indemnity for the delay without doing injustice. Where, however, the time is not restricted to the shortest possible space, most Architects will agree that the best results are obtained by making at least four separate agreements, the cellar-work and grading forming the subject of one; the carpenter-work, including painting and glazing, of a second; the brickwork and plastering, of a third; and the plumbing, of the fourth. It is often desirable to make a fifth agreement for the painting and glazing, but if the carpenter is trustworthy, there is generally some advantage in allowing these to be included in his contract.

By the system of separate contracts better work is usually to be obtained in each branch, and, considering its quality, at a cheaper rate; although speculative builders have ways of making sub-contracts at prices that seem incredibly low to those who are not familiar with the difference between the good and the "jerry" style of work. The best mechanics always prefer to treat directly with the owner; they are, in this way, sure of their pay, and can, therefore, afford to work at a lower rate, while the owner saves the percentage of profits which the principal contractor feels himself entitled to charge upon the tenders made to him by his sub-contractors. Whatever mode is adopted, too much care cannot be taken to have the plans and specifications as full and explicit as possible. If these are what they should be, a building so simple as a dwelling-house can be, and generally is, when the owner knows his own mind in regard to the kind of house he wishes, and takes the trouble to see that the plans express it, carried out to completion without any "extras" whatever, generally, to the great surprise of the proprietor, who is sure to be informed by volunteer counselors, before he begins operation, that his extra bill will inevitably be "at least as large as the contract price;" that he "ought to restrict the Architect to half the sum he intends to spend," and so on.

We make separate contracts for the cellar-work, the carpentry, the brickwork and plastering, and the plumbing, and have also selected a good furnace, and arranged with the makers to put in the requisite pipes and registers in the best manner, when the proper time comes, under a guaranty that the apparatus shall heat a given number of rooms to a temperature of 70° when the thermometer stands at 0°, without taking air from the cellar or any other part of the house, and without regard to the direction of the wind.

Occasionally, the heating apparatus is included in the principal contract, but this is most unwise. As with plumbing, the work to be done is so difficult for any one but an expert to understand or criticise; and the difference between good and inferior work is so great in value, even more than it cos s, that it should never be made the intention of any man to get it done as cheaply as possible.—*From Clark's Building Correspondence.*

Thousand of Building Lots Sold and Purchased.

During the preceding year, 1884, and thus far in '85 the number of building lots offered for sale in San Francisco, and the number purchased by parties for immediate or near future improvement purposes, has been very large. In every part of the City, "*This Lot for Sale*" meets the eye, and those desiring to buy, are afforded splendid opportunities to make satisfactory selections as to sites and localities, and to purchase privately from owners or agents. But in addition to this, since January of present year, hundred of building lots have been offered and sold (or are advertised to be sold) at public auction, and such public sales have been well attended by purchasers "meaning business;" and the prices obtained under the influence of the seductive statements of the artful man of the hammer, have in many cases been excessively high. The prices at which "*sold*" has sometimes been cried, has either been "dunning" fictions, or extravagant exaggeration of values on the part of purchasers, in either case, however, serving to inflate and influence to some exent, at least, the minds of succeeding buyers. So that the result of the sales in several instances has been a great surprise to cooler-headed people, who, being willing to buy at fair and reasonable, are not willing to pay fancy prices on already "high market" rates.

The fact that so much property is offered for sale—that a large number of outside blocks have been subdivded into 40 to 50 building lots, and sold at auction—very clearly establishes the fact that the prices now being obtained are entirely satisfactory to owners, who prefer to sell "on the top of the market" rather than risk the chances of a "further rise," which should not be possible, as real estate generally has already reached too high a figure. Even the outlying blocks, miles away from the center of business, which have been cut up into building lots and sold at auction, have brought unreasonably high prices, which assertion is sustained as a fact, by the other fact that the titles to forty or fifty lots sold in one block are scarcely perfected, before one or more other blocks are fixed up for sale, with all the cheap preliminaries of white-washed fences and trees, a flag pole floating a big flag, and such other devices as will add superficial attractions, and tune purchaser's minds up to the highest pitch of appreciation. All of which is well enough on the part of those selling, as there is no rule of law or moral ethics which forbids the practice of any legitimate means on the part of those offering to sell, to "show their goods to best advantage."

But it is a matter of surprise that so many buyers are so easily influenced, and are so anxious to "grab up" lots and pieces offered at auction, at the excessive prices which have been obtained in many cases,—prices from 25 to 200 per cent. greater than the same properties would have sold for two years ago. Advances in the values of realties are all right and proper, as showing growth and prosperity to the city, but there is a limit even in this, going beyond which reaches into the instabilities of inflation, and which, when pricked by reactions, renders the fall of him who climbs the highest, and strikes the most, the more severe.

A Badly-Used Owner.

COMMENTS UPON OUR MARCH ARTICLE.

Our article entitled "A Badly-Used Owner," in the March issue of this Journal, caused considerable comment among our Eastern brethren. The absurdity of the quantity of brick saved was so apparent, that wonder was expressed how any paper that claims to be reliable, could have published such statements. The *Building Trade Journal* has the following sensible remarks on the subject:—

"A correspondent of a San Francisco paper complains that he has been swindled grievously in the erection of a row of buildings. By his contract with his builder, a brick foundation was to be laid containing 8,000 brick, but by a liberal use of sand filling, so cheap in San Francisco, 5,000 brick were saved to the contractor. It was found that the other work was all done on the same dishonest principle. Now what is the reason? The very clear one is, the owner wanted a good house built for too

little money, and accepted the services of the lowest bidder, without any regard to his reputation or responsibility. The margin of profit for the builder was represented by the amount of sand filling and skin work, and he probably took care that he was well paid for his work. The trouble in such cases is that the quality of the work is not discovered until too late for a demand for restriction. The only remedy, as we have before argued, is to pay a reasonable price for reasonably good work, and take into consideration the previous record of the builder. The reputation of the whole building trade is greatly injured by cases such as this that occasionally come to light, and builders who will stoop to such work for the sake of a small profit should be black-listed for the public benefit and the good of worthy contractors. Beware of bids that have stamped on their face the seal of dishonesty, hidden under a cheap estimate that necessitates a quality of work not honestly in accord with specifications.

Darkening Oak.

TO RENDER new oak wainscoating and oak furniture dark, and give it an antique appearance, we have it from good authority that ammonia is the cleanest, best and cheapest material that can be used. The liquid stains commonly used are apt to raise the grain of the wood, make it rough, and it is with difficulty evenly applied, whereas in the use of ammonia it is simply the fumes that color the wood, and do it so completely that it is difficult to tell whether the wood is really new or old.

A correspondent in the *English Mechanic*, gives the following process of treatment, which he considers the best, after trying the various other processes used by builders and cabinetmakers to darken woods: "Oak is fumigated by liquid ammonia, strength 880°, which may be bought at any wholesale chemist's at 5s. a gallon. The wood should be placed in a *dark* and *air-tight* room (in a big packing case, if you like!), and half a pint or so of ammonia poured into a soup plate, and placed upon the *ground* in the center of the compartment. This done, shut the entrance, and secure any cracks, if any, by pasted slips of paper. Remember that the ammonia does not touch the oak, but the gas that comes from it acts in a wondrous manner upon the tannic acid in that wood, and browns it so deeply that a shaving or two may actually be taken off without removing the color. The depth of shade will entirely depend upon the quantity of ammonia used and the time the wood is exposed. Try an odd bit first experimentally, and then use your own judgment."
—*Scientific American.*

Modern Architectural Designs and Details. The plan of this work is very comprehensive in its character. Numerous designs are given illustrating the Eastlake, Elizabethan, and Queen Anne styles of architecture. Complete plans of each, together with full and comprehensive details, are produced in a manner that will gratify the tastes of any architect or property owner. Price, $10.00.

Plaster, How to Make and How to Use It. It contains accurate descriptions of all tools and materials used in plastering; description and action of every variety of lime and cement; instructions for making all kinds of mortar, and doing all kinds of plain and ornamental plastering; many important recipes given. Price, $1.00.

NEW PUBLICATIONS.

Mechanic's Geometry, or the Science of Framing by the Aid of Card-board Models. New edition of 1885. With the aid of card-board models, and the rules and explanations given, the mechanic can readily learn the method of getting the length and bevels of every description of rafters, hoppers, etc. Stair work is also treated in a manner that at once arrests the attention of the student, and becomes an attractive study. This book will also be found useful, though possibly in a less degree, to those who have already become mechanics, but who have not learned the science involved in their trade. The main object of this work is the elevation of the working man to the dignity of the master mechanic. **Price, Five Dollars.**

The Artisan, or Practical Methods That May be Applied to Works of Building and Other Constructions. New edition of 1885. Among the practical ideas in this work will be found the utility of the right angle, and its application in solving many useful problems. By means of a right angle the exact circumference of a circle is determined at once. It also shows a simple and correct method for the measurement of boards, floors and other surfaces. It is applied to lines of any length, and divides them into equal parts. It gives the cuts and lengths of rafters, braces, and other timbers in framing. There can be no doubt as to the value of a right angle and its utility in this connection. It is clearly illustrated in the *framing square*, a tool which solves nearly every problem in practical geometry. **Price, Five Dollars.**

Science of Carpentry Made Easy. The work *par excellence*, for every mechanic to have in his possession. It is thoroughly practical in its character, and contains much information not to be found in any other publication. It excels in its methods of obtaining the length and bevels of every description of rafters, both common, hip, and valley. Price, $5.00.

Builder's Guide and Estimator's Price Book. This work is chiefly intended to assist the Builder and Contractor in making estimates of the cost of work they may be competing for. It is written by the author of the "Steel Square and its Uses," which fact is a guarantee that the book is practical in its character. Price, $2.00.

Detail Cottage and Constructive Architecture. To the general country mechanics, this work is invaluable. Every part of a building is thoroughly detailed, including store fixtures, counters, fences, etc. Price, $10.00.

Interiors and Interior Details. A large work, and as its name implies, contains details for every style of interior finish. The plates are all handsomely lithographed. Price, $7.50.

Hand Saws and the Art of Saw Filing. This book gives full information for putting in order all kinds of saws, from a carpenter's panel saw to a steam saw mill. Illustrated profusely. Price, $1.00.

Building Superintendence. A new work and one that should be in the hands of every architect, contractor, and student. Price, $3.00.

Practical Carpentry. As its name indicates, this work presents practical answers to those questions that so frequently vex the mechanic. Price, $1.00.

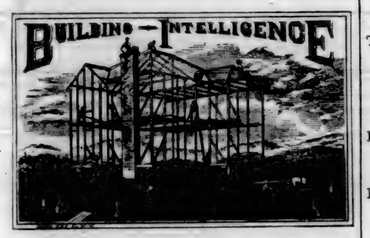
Bancroft's Histories.

THIS magnificent work embraces a complete history of the Pacific States. The territory covered is the western half of North America, from Panama to Alaska, including all of Central America and Mexico, and is equivalent in area to one-twelfth of the earth's surface.

There are to be thirty-nine volumes, with maps and illustrations, fifteen of which are now ready. They will be well printed on good paper, neatly and substantially bound, uniform in style, and will average over 700 pages each. Three or four new volumes per annum will appear until the entire series is completed. Subscribers will not be obliged to take the work unless it corresponds with the description in every particular.

	PER VOLUME.
Bound in Extra English Cloth, neat and attractive style	$4 50
Bound in fine leather, Library Style	5 50
Bound in half calf, half Russia, or half Morocco	8 00
Bound in Russia Leather or Tree Calf	10 00

Any information in regard to the above will be given by addressing the office of this Journal.



Bush, cor. Steiner. Brick and iron church.
O.—Dominican Fathers.
A.—T. J. Welsh.
C.—Carpenters, Mahoney Bros. masons, Butler & McGowan.
$70,000.

Turk, cor. Franklin. Five two-story frame; one three-story frame.
O.— — Mitchell.
A.—Schmidt & Havens.
C.—W. M. Fletcher.
$30,000.

Tyler, cor. Steiner. Four two-story.
O.— — Shay.
A.—J. Devlin.
C.—J. Marshal.
$25,000.

Green, cor. Stockton. Additions.
O.—Judge Tobin.
A.—Huerne & Everett.
C.—W. B. Kreger.
$10,000.

Market, cor. Hermann. Three-story frame.
A.— H. Geilfuss.
O.—E. Woenne.
C.—Conrad & Miller.
$15,000.

Page, cor. Steiner. Two-story frame.
O.—Geo. Schmitt.
A.—H. Geilfuss.
C.—B. Fryer.
$10,000.

Fulton, bet. Franklin and Gough. Alterations.
O.—Krouenberg & Co.
A.— — Geilfuss.
C.— — Fuchs.
$2,800.

Valencia, cor. Nineteenth. Three-story frame.
O.—Mrs. E. Mack.
A.— — Geilfuss.
C.— — Klatt.
$8,000.

Sansome, cor. Broadway. Three-story frame.
O.— — Gregan.
A.—T. J. Welsh.
C.— Haiden.
$7,000.

Filbert, cor. Laguna. One-story frame.
O.— — Wright.
C.—G. H. Walker.
$1,600.

Jessie, between Third and Fourth. Additions.
O.—California Electric Light Co.
$1,000.

Fair Oaks, nr. Nineteenth. One-story frame.
O.— — Campbell.
C.—J. D. McCarty.
$600.

Minnesota, cor. Solano. Two-story frame.
O.—J. Moody.
A.—Townsend & Wyneken.
C.—C. E. Dunsher.
$3,000.

Third, nr. Silver. Three-story frame.
O.—H. Rhein.
A.—T. J. Welsh.
C.— Larkin.
$6,500.

Sixth, nr. Harrison. Additions.
O.—N. Curry.
A.—J. J. & T. D. Newsom.
C.— Plummer.
$8,500.

Stockton, bet. Post and Sutter. Alterations.
O.—Thos. Glynn.
A.—J. J. Clark.
$2,700.

Greenwich, nr. Powell. Additions.
O.—Mrs. I. Bean.
A.—C. Carto.
$1,500.

Twenty-fifth, cor. San Jose Avenue. Two-story frame.
O.—Mrs. A. Callaghan.
A.—J. T. Kidd.
C.— C. M. Mason.
$2,200.

Haight, cor. Devisadero and Broderick. Two-story frame.
O.—A. Sorich.
A.—Percy & Hamilton.
C.— — Hussey.
$2,700.

Webster, bet. Pine and California. One-story frame.
O.—W. H. Vincent.
A.—Percy & Hamilton.
C.— — Hussey.
$2,475.

Bush, cor. Fillmore. Two-story frame.
O.—H. Diederich.
A.—G. H. Miller.
C.—J. Rebman.
$8,000.

Mission, nr. Twenty-sixth. Two-story frame.
O.—F. Feustel.
A.—G. H. Miller.
C.—L. Frichette.
$4,000.

Broadway, nr. Mason. Alterations.
O.— — Sweeney.
A.—T. J. Welsh.
C.—J. L. Binet.
$3,600.

Pacific, cor. Polk and Van Ness. Two-story stable.
O.—Porter Ashe.
A.—Curlett & Cuthbertson.
C.—D. Perry.
$3,000.

Tyler, corner Webster and Fillmore. Two two-story frames.
O.—L. C. Coleman.
A.—Curlett & Cuthbertson.
C.—I. P. Kincaid.
$7,000.

Laguna, corner Filbert. Two-story frame.
O.—Mr. Bateman.
C.— — Brotherton.
$1,800.

Laguna, cor. Green. Two-story frame.
O.—Wm. Lenfester.
A.—Kenitzer & Raun.
C.—E. Farrell.
$6,000.

Scott, near Washington. Two-story frame.
O.—C. Ewing.
A.—Curlett & Cuthbertson.
C.—I. N. Day & Co.
$8,000.

Union, near Jones. Two-story frame.
O.—F. Katz.
A.— — Henricksen.
C.—W. Sinon.
$4,000.

Fourteenth Ave., cor. N. One-story frame.
O.—James O'Din.
C.—Patrick Bardin.
$425.

Railroad Ave., nr. Sixteenth Ave. Improvements.
O.—J. Hauser.
Day's work.
$300.

Scott, nr. Geary. Two-story frame.
O.—F. Bruns.
A.—J. M. Curtis.
Day's work.
$15,000.

Valencia, near Eighteenth. Two-story frame.
O.—M. Fitzgibbons.
A.— — Hoagland.
C.—S. G. Worden.
$4,500.

Lombard, near Buchanan. Two-story frame.
O. and B.—Henry Wegener.
$1,500.

Jackson, nr. Steiner. Two-story frame.
O.—Mrs. J. Newgass.
A.—S. & J. C. Newsom.
C.— — McKay.
$5,000.

Mason, nr. Chestnut. Additions.
O.—J. Burke.
$1,000.

Jackson, bet. Fillmore and Steiner. Two-story frame.
O.—J. J. Valentine.
A.—S. & J. C. Newsom.
C.—Knight & Littlefield.
$20,000.

Fillmore, nr. Pacific. Two-story frame.
O.—P. H Felsenthal.
A.—W. F. Smith.
C.—F. W. Kern.
$8,000.

O'Farrell, nr. Fillmore. Seven two-story frames.
O.—Main & Winchester
A.—Chas Geddes.
C.—J. T. Grant.
$16,000.

California, near Steiner. Two-story frame.
O.—W J. Gray.
A.—Schmidt & Havens.
C.—J. D. McMurray.
$4,000

Union, nr. Steiner. Two two-story frame.
O. and B.— — Ardarme.
$3,000.

Pierce, nr. California. Two-story frame.
O. and B.—Thos. Randall.
$5,000.

Union, cor. Leavenworth. Alterations.
O.— — Medan.
A.—Chas. Mann.
C.—J. P. Hanson.
$2,000.

Filbert, nr. Taylor. Three story frame.
O.—H. Haltmier.
C.—A. H. Taylor.
$7,500.

Filbert, cor. Gough. One one-story frame; one two story frame.
O.— — Krince.
C.—J. Esse.
$10,000.

Green, bet. Leavenworth and Jones. Two-story frame.
O.—G. D Phillips.
A.—S. & J. C. Newsom.
$3,500.

Clay, bet. Polk and Van Ness. Three-story frame.
O.—J. Gobleigh.
A.—S. & J. C. Newsom.
C.—J. McKee.
$6,000.

Golden Gate Ave., bet. Polk and Van Ness. Two two-story.
O.—N. M. Robinson.
A.—J. J. and T. D. Newsom.
C.—John McCann.
$13,000.

Eddy, cor. Broderick. Two-story frame.
O.—Albert Myer.
C.—F. Roettger.
$4,000.

Seventeenth, cor. Eureka. Three two-story frames.
O.—Chas. Solari.
A.—Elsen and Pierce.
C.—D. Perry.
$6,500.

Ninth, nr. Market. Two-story frame.
O.—Geo. A. Ware.
A.—J. J. Clark.
C.—C. Chisholm
$2,500.

Twenty-first, cor. Treat ave. Two-story frame.
O.—Pat. Bannan.
A.—J. J. Clark.
$4,500.

Seventeenth. Frame dwelling.
O.—Thos. Manger.
A.—J. J. Clark.
$2,000.

Octavia, bet. Geary and Post. Two-story frame.
O.—Dr. J. B. McLennen.
A.—J. J. Clark.
C.—J. B. Gonyean.
$4,000.

Twenty-Second, corner Mission. Additions.
O.—P. G. Somp.
A.—J. & T. D. Newsom.
C.— — Plummer.
$2,300.

Union, cor. Octavia. Two-story frame.
O.—Capt. W. N. Shelley.
A.—and B.—W. H. Wharff.
$4,500.

Verona, nr. Third. Two-story frame.
O. and B.—J. Flood.
$2,000.

Oak, nr. Franklin. Two-story frame.
O. and B.—J. F. Gomez.
$3,000.

Haight, nr. Scott. Additions.
O.— — Brown.

Summer Building Operations in City and Country—Review for the Past Month.

WE have taken particular pains during the past month to inquire among the owners of different buildings in various parts of the city, their views in relation to the pr sent building boom and the

LIKELIHOOD OF ITS CONTINUANCE.

Simmered down, the answers from a majority of those interviewed would read about thus: In spite of the cry of dull times, more money is in circulation than for any similar period in many years. Many well-to-do people have erected comfortable dwellings for their own use, and this fact has been the agency by which large numbers of mechanics have been kept at steady work; the latter, in turn, have been able to save money and put the same in a little home, and so money has been continually changing hands and always doing that good which manifests itself in the beautifying and adornment of our streets.

Another interesting fact is noticeable: Many have borrowed money with which to build two-story flats. Living in one and renting the other, an income is derived by which more than the interest is regularly met, and, after a few years' determined and energetic action, with the practice of strict economy, a home is secured which amply repays for the struggle incurred in obtaining the same.

MORTGAGES NOT ALWAYS A SIGN OF RETROGRESSION.

The day has gone by when a mortgage is considered a sign of financial embarrassment. At the present low rate of interest obtainable in most of our savings banks, it is, in our mind, a sign of excellent business judgment upon the part of owners to procure money by this means and erect buildings upon what would otherwise be stagnant property. This matter of

LOW RATES OF INTEREST

Is doing as much, if not more, than nearly all the other ideas advanced put together towards making this city the second in importance on this continent. By the means referred too, large manufactories can be built, and numerous enterprises can be put into operation. It should be the boast of California, that we do not import a single pound of nails, nor a gallon of oil, nor a keg of paint. The shores of our bay should be lined with manufactories turning out vast quantities of glass, hardware, cement, plaster, carpets, furniture, ironwork, both plain and ornamental—in fact, we ought not to import anything that can be possibly made with profit on this coast. The lower the rates of interest, the greater number of these enterprises can be started, and this of course means the addition of thousands of operatives to our population, and the circulation of an immense amount of money.

WILL THE BOOM LAST?

At present we can perceive of no sign indicating any sudden relaxation in the number of building operations. Work has been commenced on Market Street below Drumm. The old buildings are in process of demolition, and fine brick edifices will take their place. Further out, grading has been commenced for a fine four-story building. The number of applicants for plans in the various Architects' offices, seems to be, if anything, on the increase. Owners, however, are exercising a greater amount of caution as to the limit placed on the sum necessary for any contemplated improvement. This is such as to cause misgivings in the minds of the Architect as to the practicability of conforming to their client's ideas.

IN THE CITY

A reference to our Building Intelligence will show the following facts: During the month from the 10th of April to the 10th of May, there have been started in this city—

109	frame buildings, value	$519,556
2	brick " "	11,405
16	alterations "	46,882
127		$577,843

Making a grand total for the amount of

127 Buildings of the Value of $577,843.

IN THE COUNTRY.

There is now more work—in the aggregate—being performed throughout the State, in the building line, than at any period during 1884. The following places and localities may be considered as having their share: PORT COSTA, with its immense docks, warehouses, and near by the Selby Smelting Works. MARTINEZ is livelier than she has been for some time. OAKLAND and her sister ALAMEDA are displaying more activity than at any similar period for years. SACRAMENTO is looking up. YOLO COUNTY, as a whole, presents a more than average record. LOS ANGELES is quiet, but still a goodly number of buildings are in process of erection. FRESNO and vicinity is keeping pace with the section further south. SAN DIEGO, the city of *magnificent guesses*, has awakened from its lethargy and actually several houses and improvements have been started. In fact, from every section is beginning to be heard the sound of mechanies' tools, as they are wielded by men who cheerfully look forward to a prosperous season.

LUMBER.

In spite of the new schedule, this material can be had at rates favoring the buyer. Prices may be again raised, but if an owner will take the money in his pocket and travel personally among our dealers, he will soon find out that the amount placed on the cards representing the price of lumber, is anything but that for which lumber can be obtained.

Building Associations.

THE influenc eof these organizations is being felt more and more as people better understand their workings. In all of them, the demand for money is greater than the supply. The "Mission Building Association" is growing at a rate that will soon place it at the head of those in this city. It is fortunate in having for its President Mr. Hutchinson, of Sather & Co., bankers. The premium has gradually advanced from 10 per cent. up to 14, and it is not probable that, in the near future, it will be less than the latter figure. We will endeavor soon to give a full history of the workings of these associations.

A New "Castle Hall."

THE Knights of Pythias in San Francisco have taken the initiative toward securing a permanent abiding place,—a "Castle Hall,"—for the order, where the chivalric brotherhood in this city may assemble in weekly fraternal intercourse; and brethren of the order from all sections of this State and the Pacific Coast, and those from beyond the great mountain chain which divides and sectionizes our great country into East and West, and brother knights from foreign countries, may gather and receive fraternal greetings under the order's own vine and fig-tree, with its proud banner floating above its portals, and the great spirit of pure chivalric brotherhood permeating its inner chambers.

A fine lot, 77.6"x137.6" has been secured, located along the northern line of McAllister Street, about opposite the Hall of Records. While the enterprise will be known as the Knights of Pythias Hall, and will be built for the special purposes and uses of the order, its ownership will not be in the order, as such, but in an incorporated stock organization, known as the "*Knights of Pythias Hall Association*," with a stock capital of 100,000 shares, at $10 per share.

The lodges in San Francisco have already made handsome *first* subscriptions to the enterprise, amounting to nearly $20,000 within the time required to search the title papers. It is expected that every lodge of the order within the jurisdiction of the grand lodges of California and Oregon, will become shareholders; and the individual subscriptions already in, and the excellent feeling expressed among the membership generally, assures us that the personal subscriptions to the enterprise will be large, and that soon the forty odd thousand dollars required for the purchase of the lot will be raised, and a sufficient surplus as a building fund to enable the early commencement of the edifice.

The brilliant success achieved by the order during its few years of existence, its growing popularity and great increase in membership, render it both feasible and necessary that the order should enjoy the advantages and benefits of its own Castle Hall, built for, and dedicated to, the benevolent and fraternal objects of the order, and the perpetuity of the sacred principles which called it into existence, and which in less than twenty years has caused it to grow from the small nucleus organized in the City of Washington, D. C., for purposes of the purest and most sacred character, to an order more or less numerous in every State in the Union, with 117 lodges, and a membership of 9,066 in California, and in the United States nearly two thousand lodges, and 135,000 true and valiant knights, with a present high and honorable standing among the oldest and best fraternal organizations of the age, and a future full of hope and promise.

Science of Carpentry..... **$5.00**

The Buddensick Infamy.

IT is both possible and probable that through the legal technicalities the recognition of doctored testimony, direct perjury, and shrewd legal management, so fearfully admitted and practiced in American courts of justice, the man Buddenseik, if brought to trial, will escape deserved and adequate, if not all punishment for his willful accessoryship before the fact, in the destruction of human life occasioned by the fall of the death traps provided by him in the city of New York, in the shape of houses for human inhabitants. It is unnecessary for us to repeat the story of the fall of the building shams constructed by this man, and the sad results that followed. These have been heralded by the press of the country, and are known to any one who reads the daily papers or class journals; and no disinterested person within the boundaries of the United States questions the culpability and guiltiness of the author of the calamity. except in the degree of punishment that should follow the crime,—for crime it is, whether of negligence or the more probable total disregard of consequence,—or that which is still worse, the ungodly and inhuman spirit of avarice which sets at defiance all laws and ordinances provided to control and regulate the acts of such men, many of whom, if not so bold and daring, are to be found in all parts of the country, San Francisco not excepted. The practical lessons presented in this case are the present more important points worthy of notice.

It is an unfortunate affair for New York, as it involves the reputation of a considerable portion of the real estate improvements in that city, not known to be constructed by reliable contractors under the superintendence of competent and reputable architects. The tendencies are to the depreciation of property, not beyond the possibility of doubt as to character of construction. However limited the Buddenseik class of buildings may be in fact, the happening reveals and fixes *upon the metropolis of* New York the unenviable reputation of a city containing numerous dangerously constructed buildings, and many who might otherwise be inclined to invest in New York improved real estate, will be deterred from doing so through fear of a repetition of trembling walls, fire, and sudden calamitous destruction of life.

The affair is also unfortunate in that it furnishes capital and argument, and gives color to the more or less common notion largely prevailing among the people of other countries, that almost everything American partakes of is shoddyishness and frailty. But while the adverse features of the case are numerous, the occurrence will prove beneficial in the future in this,—that without its warning the man Buddenseik, and perhaps many others of like selfish purposes, would have continued to erect buildings of similar dangerous character, and instead of a single block or row, there would have been, in time, hundreds of fraud structures, each liable to tumble at any moment, killing large numbers of innocent persons.

The good effect of this sad warning has aroused the New York officials having building matters under their control, from the slumber of unpardonable neglect; and for a time at least it may be expected that at least safe, if not eminently substantial, buildings will be the rule. Nor will the influence of the cruel happening be confined to New York. Building commissions, boards of public works, and others appointed and empowered to look after such villainous building manipulators as the man Buddenseik, in other cities, will exercise greater vigilance in the performance of their duties, and it is safe to presume that for years to come the building frauds will be held in check, and but few buildings permitted which will not pass mechanical constructive examination.

Men Who Own Their Homes.

AN artisan who is working industriously to pay for his little garden and home, has a well-defined purpose in life, and when that purpose is attained he becomes the happiest of men. It is laudable ambition to own one's own habitation, in which case a man's house becomes his castle. Rent-paying dulls the edge of effort, and helps to make a man a sort of drone in life's busy hive. Energy and industry will soon earn and pay for a home. The more a man accomplishes the more he may.

The active tool never grows rusty. You will always find those men who are the most forehanded and most forward to do good or to improve the times and the city, always busy. Who start our railroads, our machine-shops, our manufactories, and our new school-houses and churches? Men of industry and enterprise—men who own their homes that they have earned by their own efforts. As long as they live they keep at work, doing something to benefit themselves and others. We go for activity—in body, in mind, in everything. Let the gold grow not dim, nor the thoughts become stale. Keep all things in motion.

New Books.

WATER CLOSETS.—A historical, mechanical, and sanitary treatise, by Glenn Brown, architect.

This new work gives a complete history of progress of inventions in water-closet from a period beginning several hundreds of years before the Christian era, down to the present time. All the late patented closets are fully illustrated and their merits and demerits faithfully portrayed. The sections on tank and supply valves are full of new and interesting ideas. For sale at this office. Price, $1.00.

A query found in the "Mechanical Engineer" deserves to be pasted in the office of every establishment that has an elevator. It is simply: How long is it since you examined the wire rope connections on your elevator? It will not do to suppose things are safe. Inspection reveals that which was hidden, and it is startling to see what we have relied upon sometime.

"INSOLVENT.—*Frederick Cobb, an architect and builder, has filed a petition in insolvency in the Superior Court. His assets are nominal, and liabilities* $3,600."

There are not five in one hundred of Mr. Cobb's class, who are not frauds in more ways than one. Many become *builders*, because they "cannot find steady work" as journeymen; yet the fact is, beyond dispute, that good, competent workmen, unless objectionable through irregular habits, physical ailments or otherwise, are seldom idle even for a day, except of their own choice; and seven out of ten who quit the ranks of wage earners to become master builders, do so from a knowledge of the fact of their inferiority as mechanics, or if not *wholly* from this conviction, the adjunct of great self-conceit in their executive abilities, and the phantoms of great imaginary results sure to flow from the exercise of their latent geniuses, the prospects of placing themselves in positions to control and manipulate the interests of owners, and similar incentives, allure them to venture where even men of honest purposes and good mechanical qualifications have *more generally* failed to make more than bread-and-butter successes. Consequently the field of building operations in California has yielded any number of *tares* of the Cobb kind.

If such men would attempt to reach no farther than the narrow limits to which they may have a shadow of claim, mechanics, the fraudism would be less conspicuous, and they would only be numbered with the thousands of those who have from time to time so tarnished the good name and reputation of "contractors," "builders," etc., that those only who have by years of good, square and upright demonstrations of integrity and competency, gained the reward of honorable recognition. But the assumption of "architect" by such men, is simply adding insult to injury, as not one in a thousand of them has the slightest knowledge of the professional science assumed, and what they do in that direction is more frequently the result of points gained from plans pilfered in some way, ideas obtained from books, or the work of boys and employees in architects' offices.

The failure of Gilbert & Co., of Oakland, is another of like cases as that under notice. They too were "architects and builders," furnishing plans, specifications and contracts, through which assumption they drew into their net many innocent owners, who were misguided by the pretensions—not the integrity or competency of the parties. They had their short day as "architects and builders," with an ending that developed more than intelligent, honest men would consider creditable. We were called upon by one of their victims to help him in his hour of trial, his home being unfinished and more money having been paid than was due, but the papers were of a character which left the unlucky owner at the mercy of those into whose hands he had placed himself, with no remedy at law, and his interests entirely contingent upon the conditions and circumstances of the case. The contract read, "To build a house in San Francisco for A. B." (neither location nor street being mentioned), "according to plans No. 86," etc., for the sum of———. The fact was clear, that the contract was either the result of consummate un-intelligence on the part of the party or parties who wrote it, or a well-concocted purpose to clutch the owner and hold him in a helpless attitude, with no possible redress, and compel him to accept whatever might be given him in the shape of a house.

While any punishment received, is well deserved by owners who will be parties to such transactions for the sake of getting a "cheap house," it is to be regretted that mechanical, architectural and building operations cannot be so protected by law or public sentiment, that such impositions, wrongs and false pretentions would not be possible, or their perpetrators severely punished.

Mend Your Files.

ONCE in a while a file will get broken, even with the best of care; but, with the knocking about they are subject to, it is a mystery how any of them come out whole. Tell the boys to bring a file to you the very minute they break it. Have a little bottle of muriate of zinc (zinc dissolved in muriatic acid), and wet the break with it immediately; then heat a soldering iron and tin the ends of the file. Heat the file pretty warm—not enough to start the temper, but rather too hot to hold in the hand. When well tinned and hot, press the two pieces firmly together, squeeze out nearly all the solder, and let the file cool. Trim off the joint, and, if well done, the file will break in another place next time. It will not pay to solder a file unless it is nearly new. Let it lay a day or two, or, in damp weather, even an hour or two, and you never can mend it so it will stay. Take it the minute it snaps, and you can do what they used to stick a 'prentice on, viz., mend a file.

THE SHARPENING OF TOOLS.—Instead of oil, which thickens and smears the stone, a mixture of glycerine and spirit is recommended. The proportions of the composition vary according to the class of tool to be sharpened. One with a relatively large surface is best sharpened with a clear fluid, three parts of glycerine being mixed with one part of spirit. A graver having a small cutting surface only requires a small pressure on the stone, and in such cases the glycerine should be mixed with only two or three drops of spirit.

The old idea that slow grown timber was stronger than that grown quickly is disproved by recent tests in England, so far, at least, as oak is concerned. Second-growth hickory is usually more valued for handles of axes, hammers, etc., and the annual rings show it to be of swifter growth than the first stock.

Shoddy New York Buildings.

THE details are at hand of the manner in which some buildings in New York City have been constructed. The late disastrous collapse of a row of brick houses, has been the means of exposing the methods by which certain contractors have made fortunes—through and with the aid of public officials. If the latter charge is proven, they, as well as the architect and contractor, should be subjected to the workings of that ancient Persian law which provided that any architect who put up a building that from any cause should afterwards fall down, should be buried alive under the ruins of the fallen structure.

We also notice that the Persians had a way of enforcing this law with great regularity, and that they jammed the sod down tight and quick about the unfortunate builder. The result was a very substantial style of architecture, which, in many places, is still in existence, although more than a score of centuries have rolled away since the foundations of some of their structures were laid.

The best proposition we can advance to our New York friends, is to frame a law with provisions in the same according to the above. The result would be a total cessation of the erection of careless, and we may say criminal, buildings. We fancy, however, that such a law would meet with much opposition from those who adopt the *Buddensick* standard of building as a rule.

The Chapter of Architects.

FOR the first time in a number of months there was not a quorum present at its meeting of the first ult. This should not have been, and its members deserve reproof for neglect. The Chapter is on a good, sound financial and incorporated basis, and should command the support of every reputable architect on the coast. That it can be made a useful, influential and prosperous institution, commanding the respect and confidence of the profession and the public, is beyond doubt; and the only reason why it is not so, is because the architects of San Francisco fail to utilize the opportunity to bring about the result. It is but a small sacrifice for each to make, to devote one evening in each month to fraternal interchanges of views and ideas, and the consideration of matters alike interesting and profitable to all.

In the Eastern States, the Chapter interests are kept up, and much good is being accomplished, and the parent Chapter enjoys a national reputation, while in London the British society is a power in the land, and its published proceedings are worthy the reading and attention of every intelligent architect, at home and abroad. It only requires earnest effort on the part of well-meaning men, firmly banded together, to accomplish results gratifying and beneficial to themselves and others. It is to be hoped that every member of the Chapter will be on hand at its next monthly meeting. Let none be absent.

CALIFORNIA RUSTIC.

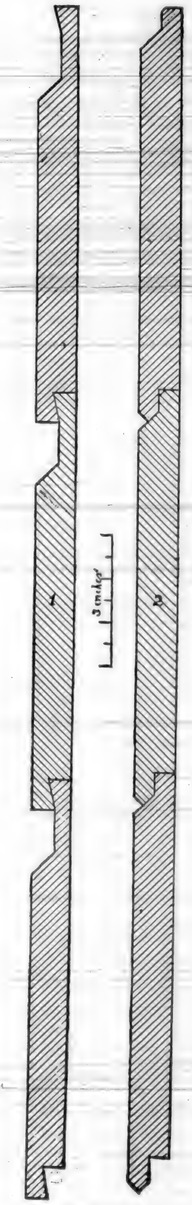

ILLUSTRATION
OF
CALIFORNIA RUSTIC

SAN FRANCISCO is largely what may be termed a "wooden city." The statistics of last year show that out of 930 buildings erected in that time, but twenty-five were brick; this, however, is not a fair comparison, as the number of frame houses erected was unusually large for that period. A fair estimate would place the ratio of about one to twenty-five. Keeping this fact in view, it is not strange that the ingenuity of our architects is taxed to its utmost in studying new shapes for the material to be used on the outside of buildings. In the earlier times, "clapboarding" was used quite extensively, but now it is rarely seen. Tongue and grooved stuff was also used, but its liability to shrink caused its use to be discontinued except in rare instances.

Previous to 1864, rustic was made of ⅞ lumber, thirteen inches wide, and, owing to imperfect machinery, was necessarily costly, the average price being about five dollars more per thousand than T. and G. surfaced redwood. The lumber had to be passed twice through the machine, the first operation being the reduction of the lumber to a uniform width and thickness. We think that it was in the year mentioned that, acting upon a suggestion made by G. B. Knowles, Mr. C. W. Thomas invented a machine by which the two operations were combined into one, and thus, by reducing the time consumed in manufacturing the rustic, materially lessened the price of the same. The mill owned by Thomas was situated on north side of California, between Davis and Drumm. It has long since been a thing of the past, and its place occupied by wholesale stores.

As mentioned before, rustic when first used was made thirteen inches wide; but this width was found to be too great, and was soon after cut down to ten inches, which is now regarded as the standard. In our illustrations, No. 3 represents the kind in most general use, and is called channell rustic. No. 2 is an other form that is much used, and is known as the V rustic. When the latter is used, it should be thoroughly seasoned and not over eight inches wide. The other patterns shown are in general use with the exception of Nos. 1 and 8. The former has one objection that will prevent its adoption. The natural shrinkage of the lumber will cause a "bump," just where one layer laps on the other. The upper edge of one piece being covered by the lap of that above, will not shrink as much as that on the outside, and so the outside will naturally, in being shortened by shrinkage, be forced out from a direct line on the face. In many kinds of lumber, this contraction would be strong enough to split the board, or at least as before mentioned cause a "bump." A still greater objection could be urged against No. 8. If used, it should be worked out of lumber not less than 1⅛ inches thick. This design was suggested by one of our first contractors, who evidently has been a deep student of the results of *capillary attraction*.

No. 7 is a design that is lately coming into prominence. It is very neat and when made from dry lumber, and care taken to have the mill work smoothly done, it gives an extra finish to the exterior of a house. With the lower lip cut off it is also a superior design for a base board, a three or three and half inch lip light moulding making it present a fine appearance.

Nos. 5 and 6 differ from No. 2 only in the width, and the size of the V joint.

There are still other kinds than those we have shown. A few years ago, it was fashionable to have the rustic blocked out to represent stone, but like all imitations it soon tired the eye, and is now but seldom seen.

The primitive style of thirteen-inch rustic is now but seldom seen, but for the benefit of curiosity seekers, we will refer them to an old house on Sutter Street not far from Mason, where

ILLUSTRATION

CALIFORNIA RUSTIC.

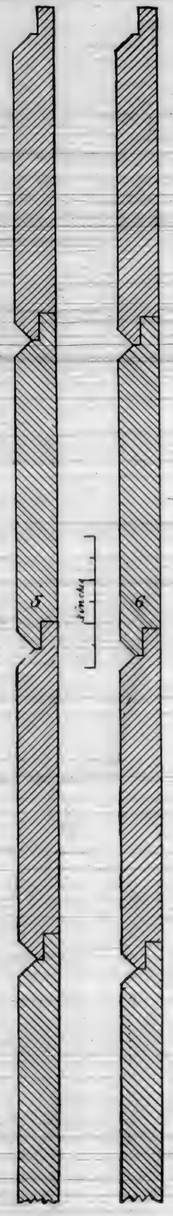

ILLUSTRATION
OF
CALIFORNIA RUSTIC.

specimens of the *first* ideas may be seen. We may add par parenthesis—that although at first from three to five dollars per thousand was charged extra for rustic, the same *liberal* tactics were applied then that are now so successfully practiced. A small bill of rustic alone would be charged the extra price, but for the sake of selling a *bill* of lumber, it would be placed at the same rate as Tongue and Groove. A difference of opinions exists in regard to which variety is best for a building,—hard or soft rustic. By far the greater portion that comes to this market is of the latter kind; it is generally preferred on account of the ease with which it can be sawed, and for the few blows of a hammer necessary to drive a nail home. But there are some of the *long heads* of the lumber fraternity who claim that *hard* rustic is much the best, when care is taken to have the same thoroughly seasoned, and due caution is exercised in the careful driving of the nails.

Never buy second quality rustic. It is more expensive in the end than No. 1. A pile of second quality rustic is made up from probably the run of several mills at scores of different times, consequently the width varies considerably, and is the source of much annoyance even to those using it on a barn. Hard pieces, crooked grain pieces, short pieces, sappy pieces, etc., are all thrown together into the second quality pile. The keen judgment of a first-class mechanic will enable him to quickly notice these different specimens; but the average mechanic consumes more time "assorting out" than would pay the difference in cost of gilt edge rustic.

In 1865 the price varied from $40.00 to $42.50 per thousand. In September, 1879, the price dropped to $20.00, which is the lowest, we think, for which it was ever sold. At present it is about $30.00.

There are buildings standing to-day upon which three different widths of rustic were used. Why the architect should specify one width for first story, a less width for second story, and still less for the third story, is one of those problems that can be answered only by the professional in charge.

San Francisco owes much of its greatness to redwood rustic. In case of fires, its more than ordinary non-combustible quality has been the means of preventing serious conflagrations. When the wood is heated, the pores of the wood naturally open; and when water is thrown on the same, the wood soaks up the water and is thus rendered less liable to combustion. Thus feeling partly protected from fire, our worthy citizens pile on the exterior finishes, and to-day San Francisco stands forth as the finest built and showiest wooden city of the world. Another safeguard pertaining to rustic, lies in the fact that it is devoid of pitch and other substances of an inflammable character. This is a peculiar feature of all redwood.

Rustic should be V stacked upon the ground immediately upon the commencement of a building; the joints and laps should be primed before being used. A strip of tin placed behind every butt joint is a safeguard against leaks from open joints caused by shrinkage, for redwood *shrinks endways*, and if the material is not extra dry, a disfiguring crevice will appear at every butt joint.

The lumber fraternity generally consider rustic a profitless article to deal in, the thinness of the channel section rendering it very liable to splits and breaks from piling, stacking, or other causes, and the least defect condemns the same from being placed in the *gilt edge* pile.

Other facts in connection with the material under consideration will be given in a future number, as several of our prominent dealers and mill workers have promised us important data in regard to *California Rustic*.

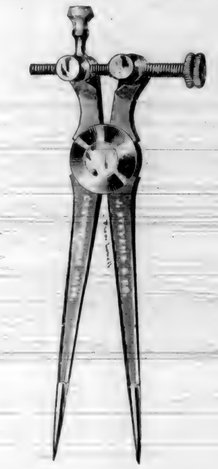
CALIFORNIA RUSTIC.



Reliable Dividers.

THE above cut represents the new style of "Reliable Dividers" as manufactured by J. Stevens & Co., Chicopee Falls, Mass. They are forged from heavy stock and operated with a right and left hand-screw, thereby removing all back lash, and making, as its name indicates, a *reliable* instrument. A sample of the above can be seen at this office. We can recommend these dividers for superior finish and the hardness of the points. Any hardware dealer will furnish you with one of these instruments, or we will furnish those living remote from cities with any number upon receipt of the price—$2.50 each for the 5-inch size.

Hanging a Grindstone.

TO HANG a grindstone on its axle to keep it from wobbling from side to side, requires great skill. The hole should be at least 3/8 inch or 1/2 inch larger than the axle, and both axle and hole square; then make double wedges for each of the four sides of the square, all alike and thin enough so that one wedge from each side will reach clear through the hole. Drive the wedges from each side. If the hole through the stone is true, the wedges will tighten the stone true; if the hole is not at right angle to the plane of the stone, it must be made so, or the wedge corresponding must be altered in the taper to meet the irregularity in the hole.

Concerning the above method of hanging a grindstone, a correspondent of one of our contemporaries writes as follows: "The method described has been in use as long as the grindstone itself, but it is not the way to do it today. Wedging the center of a stone, is a great help to burst it, and when the speed is excessive, the wedging strain is an important factor in the life of the stone and the safety of those around it. The best and easiest way, and the scientific way, to hang a grindstone is by a nut and collars, almost like a circular saw, and exactly like an emery-wheel. If the hole in a grindstone is 6 or 7 inches square (as usually made) fill up with a piece of green timber. If live timber is not available, soak a piece of wood over night in water; then it will not swell when wet and exert a destructive pressure on the stone. Take a pair of big dividers or a trammel, and find the center of the stone. Do this upon each side of the stone, and bore the hole from both sides. Bore a little larger than the shaft, or burn out the hole if your auger is not quite large enough. See that the stone is decently true upon its sides where the collars bear. If not so either chip the stone or mount it temporarily and turn the sides true. Now put it on the shaft and screw up. True the face of the stone, as it is not probable that you will get it to run exactly true. You now have a grindstone that will not come loose by getting dry every time it stands without water a day or two, and is not apt to split open when first wet. When that stone gets worn down to 18 or 20 inches in diameter, it pays to split it, and make two narrow stones, provided it was 6 or 7 inches thick originally. To split a stone, turn a groove 3/8 or 1/2 inch wide, and as deep as convenient—2 inches will do, but 3 is better—in the center of the face. A piece of 1/4 or 3/8 inch gas-pipe is the tool to use for turning the groove. Drive the groove full of dry pine wedges. Have them fit as well as possible. Do not drive too hard, or you may break out a piece and spoil the stone. After the wedges are all fitted, lay the stone in water or keep it wet, and it will split in two at its leisure."

The Credit System.

WE think too much cannot be said about the exercise of great care in the matter of giving credit. It is a most unpleasant duty to be obliged to inform any one that credit can only be given for a limited amount or on only short time, or that it can't be given at all; but it is none the less, in many cases, a duty, and is a duty we all owe, not only to ourselves but also to those toward whom we are called upon to perform it. It is a duty every man owes to himself to see that neither his money nor his merchandise is put out into hands where there is an uncertainty about its return, especially where the payment of his own bills depends upon that return. Undue extension of credit has caused the ruination of more men than has the limitation of it; and so we say, it is often a duty a dealer owes to a customer to keep him from getting too much in debt. The same principle applies to the time given a man on his account, because, being called upon himself to pay his bills promptly at a certain time, he must see to it that his own customers keep their own accounts up, and therein is where the retail dealer too often makes his mistake —*he don't collect his bills*. We have said to many people who have traded with us: "What makes it so difficult for you to make your payments when they become due?" It is true you haven't a large capital, but you get thirty days' credit here, and that should allow you to get around comfortably?" The answer has been, "My customers don't pay me." "Are you getting a lot of bad accounts?" "Oh, no, my accounts are all good." "Why don't you make them pay?" "I don't like to ask them for money because they would get mad and not trade with me." Now a man with a limited capital and a credit to sustain, which must be done if he is to buy his goods cheap, had better, in our opinion, get that class of men mad if he can't get his money without doing so (though we think he can if he goes to work in the right manner) and let some man sell them who has plenty of capital to pay his bills and accommodate people too. Don't let your customers run up large accounts with you; it is better for them that they shouldn't, and it is better for you.

A fashionable clock-maker told me in course of conversation yesterday, that, in spite of the large supply of small-priced clocks now on the market, there was still the usual demand for the large and expensive imitation "grandfather's clock," which look as if they had been handed down in the family for many generations. It is a fact that no fugitive from justice is more anxious to conceal his antecedents than many of our so-called society families are. They ride in their carriages, flaunt their wealth and hold their heads high, and yet you could confuse them by asking them what business their grandfather's, or even father's, had been. Such people buy "grandfather's clocks," old china, and such articles, and place them in conspicuous places in their residences in order to impress visitors with the antiquity of their family.—*Ex.*

When a paint brush is stiff and hard through drying with paint on it, put some turpentine in a shallow dish and set on fire. Let it burn for a minute until hot, then smother the flame and work the pencil in the fingers, dipping it frequently into hot spirits. Rinse all paint brushes, pencils, etc., in turpentine, grease with a mixture of sweet oil and tallow, to prevent them from drying hard, and put them away in a close box.

A new process for drying lumber is attracting attention. It consists in surrounding the wood with common salt. In ordinary kiln-drying the albumen is killed or destroyed, and the surface dies out first, thus sealing the juices inside to escape eventually through cracks caused by the uneven expansion of the wood. The new process is said to be better in this respect.

Steam pipes, at the temperature of steam, will not ignite wood, but superheated steam will; low water in the boilers will superheat the steam in the pipes.

Our Illustrations.

PLATE 1 represents the elevation of a very convenient and attractive city residence, plates 2 and 4 being the plans of first and second stories. The design is especially adapted to a 25-foot lot and is arranged so that abundance of light can be had in every room. Care has been taken to mark the sizes of the rooms, the names of the various apartments, closets and conveniences, so that any one at all conversant with a plan can readily understand everything in connection with our engravings. Cornices are shown in the parlor, dining-room, hall, and principal bedrooms. As shown, the plan can be carried out for about $8,000.

Plates 3, 5 and 6, are designs for sideboards. They are all of a handsome design and yet of moderate price. Plate 7 is a design for a parlor chair.

Iron Straps in Carpentry.

T. YOUNG, in the *Architect*, states that when it is necessary to employ iron straps for strengthening a joint, considerable attention is necessary that they may be placed properly. The first thing to be determined is the direction of the strain. We must then resolve this strain into a strain parallel to each piece, and another perpendicular to it. Then the strap, which is to be made fast to any of the pieces, must be so fixed that it shall resist in the direction parallel to the piece. Frequently this cannot be done, but we must come as near to it as we can. In such cases we must suppose that the assemblage yields a little to the pressures which act on it. We must examine what change of shape a small yielding would produce. We must now see how this would effect the iron strap which we have already supposed attached to the joint in some manner which we thought suitable. This setting will, perhaps, draw the pieces away from it, leaving it loose and unserviceable. This frequently happens to the plates which are put to secure the obtuse angle of butting timbers, when these bolts are at some distance from the angles, especially when these plates are laid on the inside of the angles. Or it may cause it to compress the pieces harder than before, in which case it is answering our intention. But it may be producing cross strains, which may break them, or it may be crippling them. The strap which we observe most generally ill placed, is that which connects the foot of the rafter with the beam. It only binds down the rafter, but does not act against its horizontal thrust. It should be placed further back on the beam, with a bolt through it, which will allow it to turn round. It should embrace the rafter almost horizontally near the foot, and should be notched square with the back of the rafter.

Walk the streets with your eyes open. Your daily stroll will never fail to have some ideas for you if you will only meet them half way.

PLATE 1.—SEE "OUR ILLUSTRATIONS"

Blind Nailing.

SINCE nailless flooring has become prominent in all first-class work, the form of matching has been improved by giving the tongue and groove a new arrangement that shall be more consistent with the strength of the joint

Fig. 1.

and accessibility in driving nails. Besides, a nailless floor should be self-sustaining and nailed directly to the floor-joist without the necessity of an underfloor, or rough packing of any kind, and be left air-tight, dust-proof, and preventing in this manner drafts and the penetration of foul gases. The first attempt to keep

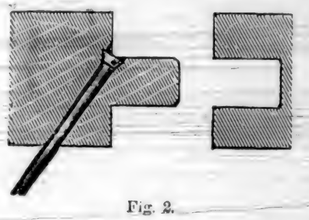


Fig. 2.

the heads of the nails out of sight was to simply toe them in from one edge; as shown on square edge work in Fig. 1, which effectually hides all traces of the nails, which of course must be well set in out of the way of the next board; but, as there were no means of securing only one edge, the flooring was likely to warp and leave

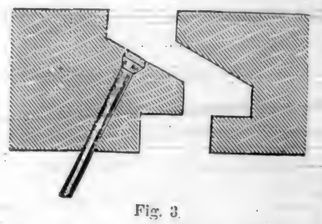

Fig. 3

an uneven floor. As soon as the matching of boards by the tonguing of one edge and grooving the other was employed to strengthen the joint, the shoulder was found sufficient to hold the floor by blind nailing, as shown in figure 2; the shoulder fitting completely over the tongue effectually hides the nails.

The Putney improvement, in the form of matching, not only strengthens the tongue and diminishes the tendency to rise and warp at the shoulder of the groove, but allows any

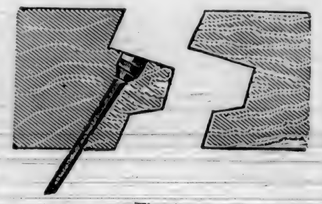

Fig. 4.

practical man sufficient room to drive the floor nails, which may be better understood by referring to Fig. 3. The nails are driven nearly at right angles with the surface of the tongue and far enough from the roots to make room for the hammer. The joint is easily forced together, and makes a union that is nearly seamless, unless they have been tongued and grooved in a saw-mill where the flooring is actually "rattled" out of on the happy-go-

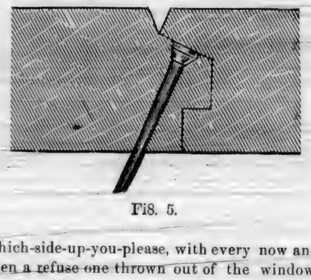

Fig. 5.

which-side-up-you-please, with every now and then a refuse one thrown out of the window. Good work requires care and attention, with machinery that will remain where you leave it. The form shown in Fig. 4 may work with better results where nail-grip is desired. Fig. 5 has been offered for filling purposes or where stock is likely to split. Flooring can be fastened by nailing through one shoulder of the groove instead of the tongue, and Fig. 6 is

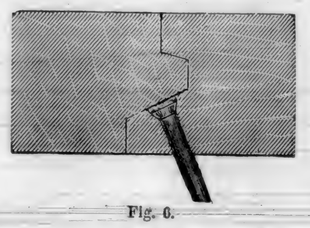

Fig. 6.

given as the most improved form of matching for this purpose. The laying requires but very little skill, and can easily be taken up and relaid without damage, an advantage that must be appreciated in temporary work. The advantages to be derived in nailless flooring where one of these substantial forms are used, must be such as to bring the whole system into extensive use.—*Boston Journal.*

Lecture to Plumbing Apprentices.

THE subject of the fifth lecture to apprentices of the Baltimore Master Plumbers' Association, which was delivered by Mr. John Trainor, March 19th, was: "The present condition of the business in Baltimore, and some of the every-day requirements of a good journeyman and helper."

"In recent years," he said, "I have seen, as others have, 'unskilled and untrained' ride rough-shod into the business, humbugging the people, and injuring the business of those who have made it the study of their lives, until the business, a few years ago, was about as unskilled, or a very great number of those engaged in it were unskilled, and consequently it became very unprofitable for those who do understand the business and had a proper regard for customers' rights and their own reputation. The beginning of a new era in the plumbing business is near, and it is again to take its place among the high mechanical arts. Hence those who expect to command first-class wages must understand the business in detail.

"Great care should be taken in arranging service-pipes, that they may be easily examined or repaired when necessary. Their sizes should be in proportion to what they are expected to supply. Dead ends in water-mains should be avoided, if possible, as they invariably collect considerable dirt, called sediment, for want of means of flushing. Air-chambers are of no value in any other position than perfectly upright, and continuations of pipes below the spigots, and over sinks and other fixtures, where the supply comes from above, never ought to be made, for they are of no value, but collect sediment, and cannot be drained out when necessary. Hydrants and street-washers should not be connected with iron-pipe; if that kind of pipe is used, then there ought to be a couple of feet of lead pipe next to the fixture to prevent the hydrant or street-washer from breaking off when raised by the frost in winter. The size and location of soil, waste, and ventilating pipes is a very important matter for consideration. None of them should be located on the outside of a building if it is possible to have them on the inside, and in no case should ventilation-pipes be on the outside, for in cold and damp weather they are of no use where they are so exposed. The size of soil and waste pipes should be gauged as nearly as possible to answer the services required of them, for, if too large, they are never flushed properly, more particularly on horizontal lines. Dead ends in soil and waste pipes should always be avoided.

"Learn the mechanical part of your business when you are an apprentice, and in after years you can keep step with the march of improvements in your business. Cultivate your hands to work in conjunction with each other. Prepare yourselves to pass such examinations as may be necessary under the 'License Law,' for if you fail in that you will have to go out of the business. So take time by the forelock, and be equipped when your time comes."—*The Sanitary Engineer.*

Various Strengths.

AN important question among architects and wood-workers often presents itself, when two substances or materials are placed in position in a manner that each will be subjected to certain strains, as to the combined strength of both. When an iron rod is placed with a joist, the natural supposition is that the strength of the double will be equal to the united strength of both the wood and iron, which does not always prove correct unless they are firmly attached, which it is impossible to do without weakening one or both; but if such appliances could be brought to bear without thus weakening, of course the combined strength, at normal temperature, would be equal to the square of the combined strength, another impossibility, inasmuch as the difference of contraction and expansion of wood and iron is such that there would be hardly a day in the year when they would both represent their original degree of elasticity and strength.

Take the following results, obtained from laboratory results, of the tensile strength of various materials, and we will find that no two of them placed together will represent the combined strength as represented. The table is based on the number of pounds' pressure required to tear asunder one square inch of each of the following substances:—

Copper,	wrought	34,000
"	cast	19,000
"	wire	61,200
Gold,	cast	20,000
Iron,	"	27,000
"	wire	103,000
"	best bar	72,000
"	medium bar	60,000
"	inferior "	30,000
Lead		800
Platinum wire		53,000
Silver, cast		40,000
Steel		120,000
Tin, block		5,000
Zinc		3,500
Brass		42,000
Ash wood		16,000
Beech "		11,500
Birch "		15,000
Box "		20,000
Cedar "		11,400
Chestnut wood		10,500
Cypress "		6,000
Elm "		13,400
Fir, strong		12,000
" American		8,800
Redwood, Cal.		10,120
Lignum Vita		11,800
Locust		20,500
Mahogany		21,000
Maple		10,500
Oak, white		11,500
Oak, seasoned		13,600
Pine, pitch		12,000
Poplar		7,000
Sycamore		13,000
Walnut		7,800
Willow		13,000

There are many substances in the foregoing not used by wood-workers, but more that are, and the table, taken as a whole, will be found correct, and handy for future reference.

Goods on Approval.

THE practice of sending out various kinds of goods on "sale and return" has attained somewhat considerable proportions in certain branches of the trade. It is severely condemned in many quarters as being wrong in both theory and practice, whilst also being held to be merely a cloak to veil the retailing of the manufacturers who adopt the plan. It is further denounced as being an innovation which invades the domain of the retailer, inasmuch as the tradesman who agrees to so vend the products of a manufacturer sinks his individuality to a great extent, and merges his ordinary profits into that which is really a commission paid to him on the sales he makes. Other objections are also made, prominent amongst them being the charge of encouraging reckless trading; that the system enables a man who may not be worth $5.00, and be void of experience, to make as good a show as the man with $5,000 capital, and well up in his business; and that it raises sundry questions of liability which are not easy of settlement. On the other hand, it is contended that practice promotes sales which might not be made otherwise, seeing that it virtually enables a manufacturer to establish branch show-rooms in different towns without being at the expense of rent, rates, and attendance, besides giving the public an opportunity of selecting from a large stock of goods, which is frequently renewed, and therefore always kept up to the latest ideas. It is also said to benefit manufacturers by "tying" tradesmen to them, and so excluding their competitors.

"Skin Plumbing" originated in the twelfth century, when the tilers attempted to do the plumber's work. The carpenters tried it in the thirteenth century, and it grew to be so bad that legislation was necessary to stop it. In the fifteenth century, 1490, the medical profession turned their attention to bad plumber's work in the attempt to prevent some of the diseases caused by it. In 1690, further checks in the shape of legislation were applied, but to-day when the skin plumber flourisheth like a green bay tree, nothing is done.

A HINT REGARDING TIMBER.—It is a well established fact that timber when seasoning springs toward the sap, and that to secure the best results, all timber should be so placed that the bearing strain will operate against the heart side. In cutting rockers, the heart side should be up; door pillars, with the heart toward the outside; spring bars, with the heart up; axel beds, with the heart down; shafts and poles, with the heart up. This may occasion loss in cutting planks, but it secures a good job.

Rats have a great aversion to the odor of the chloride of lime, and, when mixed with water and poured into the holes through which the rats pass, they usually vacate their haunts. This mixture is harmless, does not kill the rats, but drives them away—sometimes.

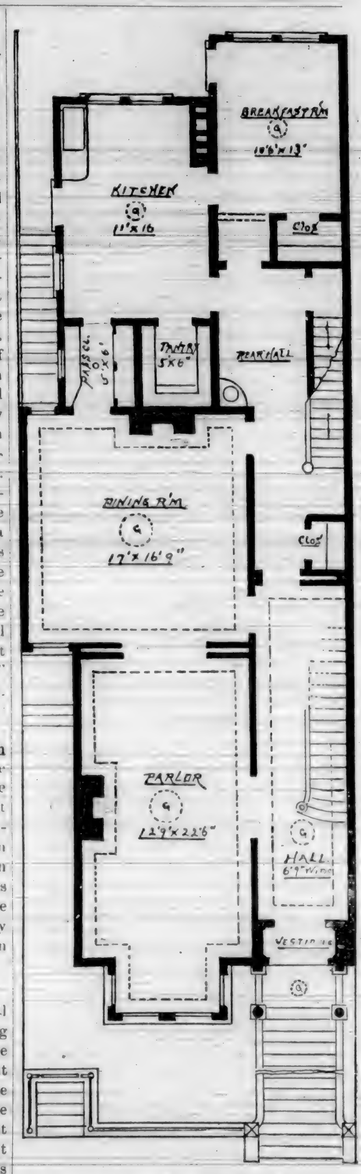

PLATE 2.—SEE "OUR ILLUSTRATIONS."

ARCHITECTS' DIRECTORY.—This work contains a list of Architects practicing their profession, in all the cities of the United States. While there are many blunders, the work, in the main, will be found to be as reliable as any similar publication. For sale at this office. Price, $2.00.

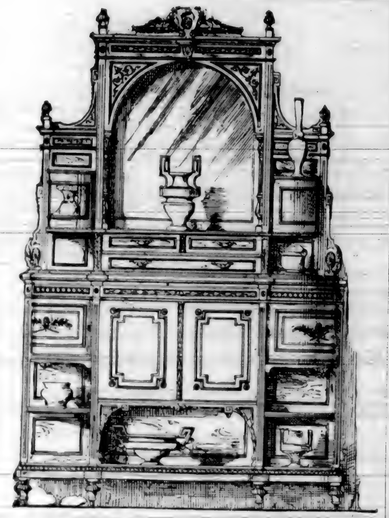

PLATE 3.—SEE "OUR ILLUSTRATIONS."

Common Sense Plumbing.

I SEE so much, or many, unnecessary requirements in architects' specifications, largely brought about by a half understanding, that I am impelled to enter a protest. Plumbers, too, who are ignorant of the actual principles involved, are as likely now to overdo, as they were formerly to leave undone. They get ideas, but lack application. Siphonage does not take place under all situations, therefore it is not necessary always to provide for it. Many pipes put in for ventilation never have a circulation. Traps are often placed where detrimental. I could cite instances, many of them, where the most ridiculous arrangements are called for, which the plumber has to fulfill, knowing it is just so much worse than wasted. You may not consider the protest worth attention, but if you could see and know what our daily experience is you might think as we do.

The writer has had many years' experience in the plumbing business, employs many men, sometimes makes specifications, but more often carries out others, some of which are good, explicit in requirements and evidently founded on fair knowledge of the business; others are faulty, full of loop holes, indefinite and inconsistent. Some are made up as you would make a mince pie, having lots of good features, but terribly mixed. It seems to be thought that if one only gets the traps, the vents, and all the "latest" sanitary features in somewhere, they will "count" and "show up". But who can tell what the actual benefit is, or whether it all is a benefit? The owner looks at the "roughing in," sees that the joints look nice, asks where the ventilation pipes are (he has read about ventilation), is pointed to several that start from some pipe and end in the same pipe, a little distance apart, and several more that go out of the roof with ———'s patent ejector. The net-work of pipes he does not comprehend, nor never after tries to. His house is cut in pieces to get the "system" in, but he contents himself with the fact that the price paid and the amount of ventilation done will forever "bar out" the innumerable diseases due to sewer-gas, which he has read so much about, and of which so many, except plumbers, die. I believe in good plumbing and good fixtures. There are some essentials, as regards vents and ventilation (the two terms are often used as one and the same but differ materially); but the point is this, are we not running to extremes in providing against every "theoretical result" that may appear in print, without giving it a study? Experience and observation often prove the fallacy of much that is advocated. It is not the design now to point out the errors committed in overdoing. The locality, the system of sewerage, the character of buildings, should be considered. Many things, applicable to New York, Boston, and other seacoast cities having tides, would not apply to interior cities. The plumbing of the South will differ from that of the North in many respects. Simplicity should be aimed at. A multitude of pipes, in every conceivable situation, generally inaccessible, may be, in time, a greater source of danger than the lack of some considered desirable, though not essential. Finally, there is a mean between extremes that is nearer the right. Let that be sought, in order that the owner be not unnecessarily taxed, and that he may realize that conveniences can be had without excessive cost. In the "long run," the plumber will be benefited by the greater demand from those that now fear it to be an expensive luxury. Do not be misled by sketches of arrangement seemingly so simple on paper, but practicably inapplicable in actual construction. Let there be a common-sense reason in construction.—*Warren C. Weatherly, in Sanitary News.*

Queen Anne Cottages.

THE reign of good Queen Anne is not likely to be held in high estimation much longer, if the architecture and fittings associated with her name are carried to extremes that begin to threaten. The good lady was rather modest in her tastes and likings—so modest, indeed, that she would not allow her mint masters to stamp her bust upon the coins of the realm until they had duly shielded it with drapery. Indeed, her scruples approached to prudery. What would she have thought, then, of such a bravery of red paint, gilding, tiling, spindle-work and gilt ginger-bread as those who take her name in vain, affix to "Queen Anne" houses and cottages to-day? If modest and sincere, nothing is prettier or more home-like than a Queen Anne cottage with its red roof and clustered chimneys peeping above a screen of shade trees, or a patch, or orchard.

In rustic surroundings it has that aspect of stability, peace, order and content that mark the cottages of England. It is picturesque in its broken lines, its porches, balconies, bays, gables and dormers, and if painted in quiet dark green and dark red, it is a grateful feature in the landscape. It is a great improvement on the "balloon frame" house of wood, and the geometrical structure of brick—artistically worthless structures. But what are we to think of a Queen Anne cottage painted a "howling" vermillion and a staring chrome yellow?

What taste is shown in a Queen Anne house that is shingled on one side from roof to basement with never a window or a peep hole, though the blind side of the house would, if it had eyes, look into a pretty garden? What do his neighbors think of the Teutonic gentleman who, after having rising suns carved on the wooden triglyph above his porches, is having those suns covered with gold foil and causing them to shoot forth rays of violet crimson? Yet these things are to be seen within an hour's walk of each other. There is too much straining after effect in it all; too much of the advertising chromo wrought into building material.

A few hours before this writing, I passed a city house in a dull row of yellow brick shops that had been Queen Annefied by sundry wooden addenda, and that was being painted a strong turquoise blue in two shades. The color combination would not have been unpleasant had the house stood by itself, but when it was backed and faced and flanked by dingy, graceless houses of red, white and yellow brick, and when it is stated that it stood in a crowded, dirty street, it may be surmised that its appearance in such a place was grossly incongruous.

Our city streets lack home-like houses, but the way to distinguish the homes from the shops is not to paint them like tea stores. They should rather give token of quietness and retirement. The English have the advantage of us in that respect. Their old houses look like homes, even though they crowd one another in a narrow street and overhang the sidewalk by a projecting second story. The domestic purpose of these houses is as plainly indicated as if it were advertised. We have good house building enough if architects and builders and decorators will only take pattern from it.

In Long Branch, Flatbush, and Richmond Hill—to mention the environs of New York alone—are handsome residences in Queen Anne style, well considered and picturesque from every point of view, strikingly beautiful in groups, and when surrounded and offset by lawns and trees and gardens, and in New England the style is being advantageously applied to churches, town libraries, public halls and schools. The style has too many good points to come into disfavor, but exaggeration fosters prejudice against it and may result in working it harm. It is when one sees an intrinsically, meritorious thing marred by poor workmanship and undiscipline taste that he deplores the lack of artistic training by those mechanics whose province is truly a branch of applied art, and regrets that no closer union exists between the designer and the workman.—*Decorator and Furnisher.*

Improvements in Window Sash.

OUR readers are measurably familiar with a number of important improvements in the construction of a window sash and in the mode of hanging and adjusting them which have been introduced in this country during the past twenty-five years or more. One of our English exchanges, commenting on an exhibition of building appliances recently held in England, discusses this subject, and, although the improvements referred to are for the most part such as have originated outside of this country, the description cannot fail to be interesting to our readers generally. The account is as follows:—

Since the days of Queen Anne, when the sash window seems to have largely superseded the old English casement of the Tudors, people have been contented with the ordinary mode of opening sashes by weights and pulleys, and up to the present day the larger number of residences are fitted up upon precisely the same model as that adopted during the Georgian period. Little or no improvement has been made in the details of the wooden sill, the "meeting" rails and the construction of the pulley stiles, the forms of which still retain their early peculiarities; and it is only in houses built after improved methods that we find any attempt made to alter these forms or to improve the method of handling the sash. Visitors to the Health Exhibition will have noticed several improved systems in going through certain departments of the exhibition, which are unheeded by the great throng of sight-seers, as mechanical appliances of little interest to them. Some of these improvements are attempts to get over the difficulty of cleaning the outside of the sash. In small windows the difficulty is not great, as one's arm can reach to the upper panes; but in large windows, such as those fitted in town houses of any size, there is not only difficulty, but danger, in the attempt to clean the outside.

Several patents have been taken out for improvements in sash-hanging, many of which have fallen through from apathy on the part of architects and builders in availing themselves of improvements; the consequence is that nine-tenths of our houses have windows of the old type. Some way of removing the inside beads and disconnecting the sash from the pulley-cords, so as to let the sash fall inward, has been the chief effort with many inventors, though the difficulty of the upper sash remained, and the problem presented itself of making the parting bead between the two sashes movable, to supersede it altogether, or to press it back so as to allow the upper sash to be taken out. There are different methods that have been patented for effecting the object, which are pretty well known to our readers. One of the methods devised consists of being able to convert the vertical sliding motion into a swinging action by movable metal tongues, the sashes being turned round upon centers in the pulley stiles by certain alterations in the construction of the stiles—a plan adopted with much ingenuity in the new patent "anti-accident" window of Mr. R. Adams, whose "National Standard" window is well known to architects and builders. Another plan for effecting the same object is to hinge the beads, and to give a casement or door motion to the sliding sashes when it is necessary to clean them. These are called "double-action sashes and frames," and a working model of one may be seen at the Health Exhibition (exhibit of W. J. Penny).

The advantages of either of these methods is that the sashes can be opened or thrown up so as to allow a large piece of furniture to enter or be removed from a room, or for making an exit in case of fire. Another plan that was introduced some time ago was to make the sash frame movable by hinging the whole window on one side—a mode of opening which had the merit of simplicity, though more cumbrous and open to the objection of its being rather an unsafe fixture. Other complicated plans consist of removing the weights through "pocket pieces" specially prepared, and detaching the lines from the sash by other means—patented fittings being used. Such plans could rarely be brought into operation by other than skilled hands, and generally only a joiner could remove the sashes. The sash window has other faults which the skill of inventors has been called upon to remedy. The sashes, if not properly made and fitted and of seasoned stuff, shrink and let in rain and dust and noise. These are evils which many who live in new houses have to endure, greatly to their own discomfort and to the trial of their temper. What can be more unpleasant than a rattling window, or one which admits the draft? The names of patent sash fastener are almost legion, many exceedingly complicated contrivances which no one can understand, and others so cumbrous as to disfigure the window to which they are attached.

We know several very excellent fasteners—such as Adams' "adjustable and secure sash fasteners," and Cope's patent fastener—but the greater number of these appliances are sadly out of proportion to their work, or are complex and difficult in operation. A model at the exhibition shows a window (Tucker's) constructed with water-tight sashes and frames which exclude drafts, dust and rain. In this instance india-rubber cushions are fixed at the top and bottom and at the meeting rails, which fit into corresponding hollows on the head, sill and rail, while the parting beads are screwed to the stiles and have a side tongue which fits into grooves at the sides of sashes. The plan is effectual if the wearing parts are durable, but we have some suspicion of the endurance of india-rubber in positions exposed to alternations of temperature, wet and cold. Other improvements have been made with the object of allowing the sashes to be partially opened for ventilation; among these may be mentioned Adams' patent sash bolt, by which the sash can be fixed at any distance, and the patent ventilating bar—a capital addition to the ordinary window. There is a model also of a sash made with a false head or casing at the top, by which the upper sash can be raised to allow a space for ventilating at the meeting rails. Mr. Bedborough, architect, patented a plan for effecting the same object, but in a more desirable manner, by making the top sash so much in excess of height of the lower one that it could be lowered at the rail without draft. Several "improved" windows are

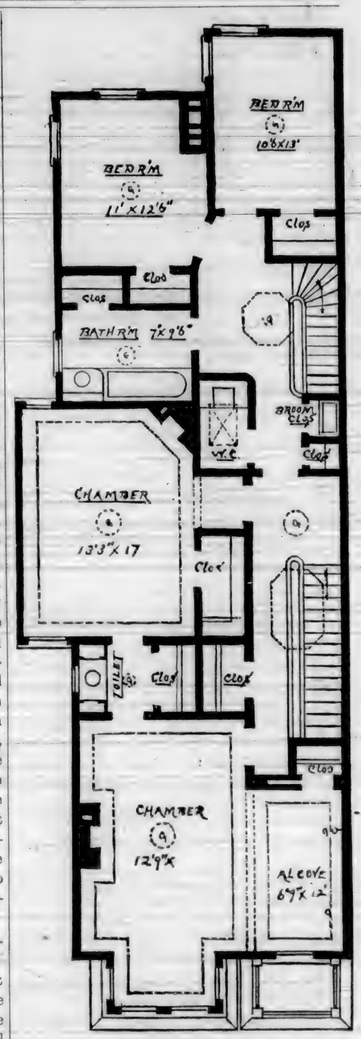

PLATE 4.—SEE "OUR ILLUSTRATIONS."

constructed so that the sashes are made to balance one another, the opening of the bottom sash lowering the upper one; but the plan is not unobjectionable. The objection to weights, which are very liable to become detached from broken cords, is certainly one calling for removal by some better mode of hanging than we at present adopt. Generally the mechanism of the sash window seems to be a subject of sufficient importance to induce a committee of experts to report upon the matter. The trade might be invited to co-operate with architects, or, perhaps better, a prize might be offered for some improved mode of securing safety, ease of movement, cleaning facilities, ventilation and weather-tight qualities in our conventional window.

The Perils of Underpinning.

UNDER this title we recorded recently the result of an action to recover damage in compensation for injuries received through negligence on the part of defendant. The circumstances were as follows: The defendant in the action employed the plaintiff, a bricklayer, to do certain work on defendant's premises, who personally superintended the work. He was to underpin a wall with Portland cement. The wall was underpinned nine feet, but as this was not considered sufficient, the defendant gave orders to underpin another eighteen inches, which was excavated to the whole length of the wall. While the plaintiff was engaged in the operation of pinning up, the wall came down, breaking his legs, and necessitating his confinement in a hospital for fifteen weeks. It is almost needless to say the jury found a verdict for the plaintiff, assessing damages at £100. There was an obvious case here of negligence. The wall having been underpinned nine feet, an extra eighteen inches was ordered, and the navvies had actually excavated the entire length of wall to the required depth. Two lessons are to be drawn from the occurrence. Mechanically, the risk of undermining a wall, or taking away its support even on one side, is great, and incurs serious danger, notwithstanding which we find bricklayers ready to risk their lives upon the most foolish assumption. They often think an old wall will bear any amount of cutting about, and that it is self-supporting. Not long ago we examined a party-wall which had been excavated along its whole length on one side below the footings. What occurred may be easily imagined. The lessee of the adjoining house suffered much in consequence. The walls throughout the house were seriously cracked, and the settlements threw all the sash-frames and cupboard doors near the side wall out of square, so that they could not be opened or closed. The staircase walls showed large fractures, the steps of stone were cracked, and the sills of windows, and the papering and plastering were also fractured and torn. The whole wall, which was a heavy one, had sunk, owing to the lateral resistance of the soil below the footings having been removed. There was a natural compression of the ground below the wall, which might have ended disastrously if the cross-walls and connections had not been contributing to the support. The operation of underpinning is one of those which frequency has rendered careless. It is a common thing to find a considerable removal of wall before the pinning up is commenced, a proceeding which is thought to expedite the work. Nothing can be more dangerous to, nor more reckless of, the lives of those employed in the operation. The very term "underpinning" expresses a piece-meal process, the removal of only a small portion at a time, and the part pinned up in cement and hard materials. A wholesale excavation beneath an old wall is simply taking away its support and hastening its fall. We see besides a variety of operations carried on adjoining a wall of very unstable character, such as digging trenches for foundations and draining, without the slightest care being exercised by shoring the structure. In walls of doubtful composition, or full of old insertions and settlements due to bad foundation, the utmost caution ought to be used, by strutting the wall and inserting "needles" under shaky parts of the structure. On clayey and peaty soils the drainage of water has often a very prejudicial effect, by causing the foundation to yield.

As most of our readers are aware, in common law a neighbor has a right of natural support of the soil, so that if an adjoining owner, by underpinning, causes it to fall he is liable for damages. There is a special easement of support from adjoining land acquired after a certain period of time (twenty years). The case of "Rigby *vs.* Bennett" is instructive as showing the liability of a building owner to underpin his neighbor's wall before going below it. The plaintiff bought some land in Whitechapel on a building lease, subject to approval of plans. After obtaining consent, he commenced building. An adjoining lot was subsequently purchased by the defendant on like terms, and he proceeded to build an end wall, and commenced to excavate below the plaintiff's foundations, calling upon him to take steps to underpin or otherwise secure his building. The plaintiff refused, and obtained an injunction restraining the defendant from further excavating without underpinning plaintiff's walls. It was arranged that the underpinning should be done so as not to delay time, and the cost of it await the trial. The Vice-Chancellor decided in favor of the plaintiff, and the defendant had to pay cost of underpinning. The defendant appealed against the decision, but the court dismissed the appeal with costs, it being held that the first to build and take up his lease was entitled to support of the adjoining land, and if the defendant wished to go down lower, he must first underpin his neighbor's wall. The same thing would have happened if the wall had been a party-wall, unless the plaintiff derived any benefit from it, in which case he would have had to pay his proportion of the cost.

Walls are sometimes found to overhang from insufficient foundations, and the greatest care is required in underpinning. An important case of this kind was heard some time ago (December, 1878) before the Master of the Rolls ("Duke of Westminster *vs.* Tattershall"). The plaintiff sought to restrain the defendant, who had erected a massive building of great height, from overhanging the plaintiff's land, and claimed damages for the injury. The wall in question abutted close to the plaintiff's land, part of the brick footings and concrete of the wall being within the limit of the same; in fact, the foundations were alleged to be upon the stratum of peat above the London clay, instead of being carried down to it. An irregular subsidence took place; the wall had cracked, and the external wall overhung the plaintiff's land ten inches, so that he could not proceed with his building. On the defendant's side it was contended that the wall would not have further encroached had the plaintiff properly shored up the building after having dug certain trenches. Certain strengthening works were rendered necessary, for which the defendant made a counter-claim. Here was a building resting on a bed of peat, which, as it was affected by moisture, caused cracks to appear. How to deal with a building so situated is not an easy matter. It was alleged by one of the witnesses called that the piles driven for the new foundations shook the concrete under the building and caused the cracking. We merely instance the case to show the extreme carefulness necessary in preparing foundations for new buildings next to structures of doubtful stability. After the piles were driven, the earth was excavated, and concrete filled in, the piles being wedged up tightly—the only right course that could have been pursued. But excavating trenches near or below walls of shaky condition, especially when the footings rest upon peat, is not a plan that can be defended, nor is underpinning in brick practicable where great weight has to be borne. It has been said by a good authority that it is not possible to underpin ninety tons by bricks, as they would crush. In such an instance the only substantial means of securing stability is to use Portland cement concrete for the underpinning, and to take every care to secure the wall from cracking or collapsing, by shoring.—*Building News.*

The subjoined simple preparation will be found desirable for cleaning and polishing old furniture. Over a moderate fire put a perfectly clean vessel. Into this drop two ounces of white or yellow wax. When melted, add four ounces of pure turpentine, then stir until cool, when it is ready for use. The mixture brings out the original color of the wood, adding a luster equal to that of varnish. By rubbing with a piece of fine cork, it may, when it fades, be renewed.

Real Estate Market.

THE activity in real estate is less than it has been in the recent past. That it should be so, is both natural and reasonable, nor is there any discouragement in the fact. During the past six months there have been a very large number of building, and some business lots sold, and all of them at high prices—prices which could be obtained only upon an excited market. But buyers have been numerous, and almost every piece of property that has been sold, has been at prices *satisfactory to owners*. There is still a large number of buyers seeking investment for both improvement and speculative purposes, but the top of the market being reached in the latter, at least for the present, there is but little inducement to those having spare coin, to tie it up in investments which are not likely to advance beyond present set values, for some time to come; and those desiring pieces for homestead improvements, hesitate to pay the prices demanded for choice lots, which in scarce a single instance are not high, and generally extravagant; while for rental improvements, the inducements are not strong. The only break in the real estate market, is from high to moderate prices.

The tone is good and sound, and properly will continue to find ready purchasers at fair and right values. There have been lots sold within the last six months, at prices which could not be duplicated to-day, for the sole reason that they were bought under the influence of excitement, and sold high, and it will require time to bring actual value up to the prices paid. Our real estate auction houses have been places of joy and rejoicing for the man of the hammer, for real estate owners, and sometimes to purchasers; and the outlook is still excellent, but not at advanced rates, except in special property. The thousands of lots sold during the past year, must necessarily have largely filled the demand, and the "go slower" period must follow. A calculation based upon the sale of real estate in San Francisco during the past year, supposing it all to have been bought for improvement purposes, would indicate a population for this city, by the end of ten years, of 750,000, a number far greater than can reasonably be expected.

FALLING OFF IN BUILDING.

Our first quarterly report for 1885 showed a state of affairs in building activities, far in advance of any preceding year, for the same period. The great rush that has prevailed, has been largely influenced by the low price of lumber and building materials; by this, more than by an actual demand for more buildings, for either tenement or business purposes. Hundreds of houses and flats have been erected under these circumstances, until the "to let" signs have become numerous on almost every street in the city. Consequently it is to be expected that fewer buildings will be erected during the remaining months of the year, than has ruled since January first, although our report in present issue shows a continuation of brisk activities. If the same ratio of building was kept up, as has prevailed so far this year, there would at the end of ten years be homes for one million of inhabitants. It cannot therefore be otherwise than a little letting up in the future,—for a time at least.

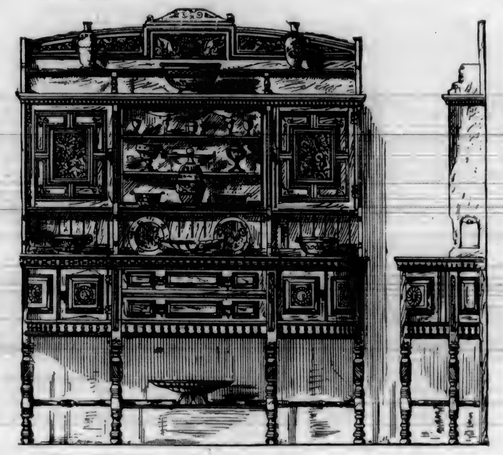

PLATE 5.—SEE "OUR ILLUSTRATIONS."

Fiber in Nails.

UNLESS cut nails are made from better material than is used generally now, their place in the market will be usurped by nails made from fibrous material. Wire nails are very favorably regarded, and are used in preference to cut nails on account of their superior tenacity, notwithstanding superior cost. The iron for cut nails, after being rolled, is slitted or cut lengthwise to a width adapted to the length of the nail to be cut. The length of the nail so cut is directly across the fiber which the iron has acquired by rolling, and, of course, shows it weakest where it should be the strongest. The ordinary cut nails will not drive into seasoned hard wood without "crippling," even under direct blows, and when the blow of the hammer is slightly to one side, they snap like clay pipe stems—they have no tenacity. The weakness of these nails is shown by the fact that it is almost impossible to straighten one that has been drawn from the wood, and then drive it again; in many or most instances the nail will break in drawing.

On the contrary, the wire nails may be crooked into corkscrews, and then be straightened and be redriven. They are not only tough, but they are stiff, and will penetrate hard wood where the cut nail would break sharply off or hopelessly crook beyond restraightening. In every respect the fibrous nail is better than the cro-scut nail. If it could be afforded at the same or an approximate price it would take the place of the ordinary cut nail.—*Scientific American.*

One of the greatest evils of the present day is the unfitness of the average workman for anything but mere routine work. Such a thing as a knowledge of the general details of a craft or trade, is almost unknown. The workman, from boyhood up, has become so accustomed to the pursuit of one idea, one branch of the trade, that he strives only for mediocre excellence in that one branch, and has no ambition beyond that of acquiring a sufficient knowledge of the particular line of business in which he is engaged to insure him the maintenance of his situation. The average workman, if he has the intelligence, has not the ambition to perceive that the skilled and careful man, familiar with all the details of the business, is the one who is most likely to retain the good-will of his employer, and fails to perceive that when the hard times come, the man with the limited knowledge of his business is the first to be dropped from the pay-roll, while his more competent brother, when work fails in one branch of the business, can be profitably put at work in another. Every man should thoroughly master all the details of his business, and some day, he cannot tell how soon, the opportunity will come for him to better his condition and take advantage of those acquirements which have come to him in the days of his apprenticeship. —*The Cincinnati Furniture World.*

Among the artisans, carpenters take the lead in numbers, having increased from 150,000 in 1850 to 373,000 in 1880. A reduction in the rate of increase is noticeable in late years, due to the manufacture by machinery of doors, sashes, etc., work which was formerly done by the job.

PLATE 6.—SEE "OUR ILLUSTRATIONS."

The Workman and His Tools.

WHY is it that the mechanic can work with greater ease and to better advantage with his own than with another's tools, even though the latter may be in size and shape identical with his own? Is it a matter of nerve or mind that makes the difference? That workmen do prefer their own tools and can work better with them is a well ascertained fact. The student even prefers his own books, and can use them to better purpose than other volumes, even if the latter come from the same printer and are enclosed in a similar binding. Not unfrequently we find an old mechanic clinging to an antiquated tool, because he likes it better and finds it handier for him than a new and improved one. If asked why he prefers it, he will say that he has become accustomed to its use and does not care to change. He will sometimes use a lathe tool having a peculiar angle, preferring it to any other, because he has learned to work with it, and has no trouble in using it, while to employ one with another angle would necessitate a change in position, and perhaps a re-training of the muscles of the hand and arm in order to do his work with satisfaction. The workman can always wield his own hammer with more effect than any other, and the same rule prevails with the use of all tools that are frequently employed by him. He clings to his friends, the old tools, with a tenacity surprising to those who are not familiar with the intimacy which, we may be allowed to say, grows up between him and them.

When one becomes habituated to the use of an instrument, he manipulates it with something like automatic precision. His hand knows just when to take it up. It, in a sense, becomes fitted to the hand, and there is something in the trained touch akin to the skill displayed by the musician in striking the keys of the piano. This action is half physical, half mental. It begets a sensitiveness that comes from long practice and skillful handling. Every curve or angle of an instrument touched by the hand leaves a mental impression. So sensitive is the mind to this observation that the mechanic instinctively knows when there has been a change produced in the shape of a tool during his absence. The hand will detect the defect before the eye. Thus, if a small chip be cut from the handle of the hammer the workman will discover the change immediately upon taking it in his hand. The nerves of the hand communicate the fact to the brain even before the eye has picked up the imformation. The weight of the tool is as important to the workman as its shape. If he is asked to use a lighter or heavier hammer than the one he is accustomed to work with, he will find more or less difficulty at first in wielding it. Even a sligh difference in weight will be immediately perceptible to him, and often prove a severe annoyance until he becomes accustomed to the change.

Perhaps all mechanics do not become so sensitive to the use of tools as those we have alluded to. All have not the delicate touch. All pianists are not delicate players, and a few are so insensible as to play without that spirit and understanding which marks the true artist. The good mechanic loves his tools, and feels that regard for them that the student entertains for his books. Indeed, they are his helpers—assistants in his daily toils. That he should prefer them to new ones is not strange. They enable him to do his best work. It is an unfeeling workman who can throw away an old tool without a sigh of regret.

NAILS IN A POUND.—It is said there are ten more nails in a pound of 8-penny iron nails than there are in a pound of 8-penny steel nails. If this is true there would be 1,000 more nails in a keg of 8-penny iron nails than there would be in a keg of steel nails. The count is said to have been made at Wheeling.

"There's tricks in all trades but ours." Speaking of walnut logs, the New York correspondent of the *Northwestern Lumberman* says: "Some of the logs get extensively doctored before they arrive here. I saw a lot in the railroad yard the other day that the shipper probably intended for good logs, and, to cover up some of the defects, doctoring had been done; but it is really time wasted, as the keen eye of the buyer will carefully scan every inch of the surface. In the end of one log a hole had been filled by driving in charred bark and cutting it off smooth, evidently expecting that the paint would so conceal it that the defect would not be noticed by the measurer. One log had a hole in one end at the heart three or four inches in diameter and this was carefully plugged with a round piece of poplar with the heart in the center. This had been smoothly cut off even with the end of the log, and the paint did hide the defect pretty well."

Bancroft's Works, Vol. XIII.

HISTORY OF MEXICO 1824 TO 1861.

THE 16th Vol. of the series of "Bancroft's Works" is now being delivered to subscribers. The original plan of the series has deviated from that first given, so that although the above is given as Vol. XIII it is really the 16th that has been delivered.

The present volume contains a very full and graphic description of the history of Mexico from 1824 to 1861. During that period occurred the war between Mexico and the United States. The various causes which led to that unfortunate episode, the result of the various battles, the advantages gained by the U. S., are described such as can only be portrayed by Bancroft. The author does not believe that the war was a just one, and takes the ground that it was precipitated by President Polk's action in ordering troops beyond the limits of the United States and into Mexican Territory.

There is quite a difference in the accounts of the various battles, as given in this work and those found in other histories. In our opinion the account before us is a just and equitable one, this deduction being made from a careful consideration and study of the various statements by different authors, supplemented by conversations with parties who were actively engaged in the Mexican war.

This strikes us as a fair inference further, because in his preceding volumes Mr. Bancroft has established a most enviable reputation for impartiality and loyalty to the truth. Besides, it will not be doubted that the data from which he writes the history of Mexico is as nearly complete as possible; in fact, the most reliable and comprehensive in existence

Bancroft's Histories.

THIS magnificent work embraces a complete history of the Pacific States. The territory covered is the western half of North America, from Panama to Alaska, including all of Central America and Mexico, and is equivalent in area to one-twelfth of the earth's surface.

There are to be thirty-nine volumes, with maps and illustrations, fifteen of which are now ready. They will be well printed on good paper, neatly and substantially bound, uniform in style, and will average over 700 pages each. Three or four new volumes per annum will appear until the entire series is completed. Subscribers will not be obliged to take the work unless it corresponds with the description in every particular.

	PER VOLUME.
Bound in Extra English Cloth, neat and attractive style	$4 50
Bound in fine leather, Library Style	5 50
Bound in half calf, half Russia, or half Morocco	8 00
Bound in Russia Leather or Tree Calf	10 00

Any information in regard to the above will be given by addressing the office of this Journal.

Cumming's Details	**$6.00**
Architects' and Builders' Pocket Book	**3.50**
Cutting Tools	**1.50**

The Enterprising Hardware Dealer.

THE hardware trade of a town is largely what the dealers make it. To a certain extent they create the demand for the goods they sell. Their method of buying presupposes this fact. Otherwise dealers would consult their customers before making selections. True, many articles are bought with a view to anticipate the wants of the purchaser, but there is a large share of the stock which the dealers buy on their own judgment, and with a view of inducing the trade to concur in their choice. Thus, in the matter of stoves, they select such styles, kinds and make, as they deem either the best or the most easily sold, relying upon their ability to make their patrons purchase the same on their recommendation. There are merchants whose power of persuasion is greater than others, and whose voice in controlling the choice of articles by their patrons is very potential. Such dealers are an authority in their several lines. To reach this position it is necessary that one have a thorough knowledge of the business, and full information relative to the comparative merits of various articles coming into competition. The dealer would make a poor show in attempting to sell a new lock at a higher price than charged for those ordinarily kept in stock who could not explain to the purchaser wherein the new lock was superior to the old. Some feign a knowledge in such matters that they do not possess, but they are likely to come to grief, as such shallow pretenses are sooner or later discovered.

The merchant often is called upon to introduce an entirely new thing. Here he certainly is an innovator, and must rely upon his powers of persuasion in bringing it into use. The mistake which many merchants make is in thinking that it is better to follow their trade than lead it. This conservatism might have done in early days, when competition was not rife, but it is no longer safe to follow this course for fear that some enterprising competitor will step to the front and carry off the business. New things are very taking. They often find purchasers on account of their novelty. It is a good reputation for a store to have it generally said that in it are kept all of the new articles in its line. Customers find this out much more rapidly than many suppose. If a merchant once gains a reputation for enterprise, it becomes a part of his capital. He can do much toward cultivating a correct public taste. But he cannot sell silver-plated butts or other ornamental hardware unless he keeps them. He cannot induce his customers to have faith in such articles unless he himself has faith in them. It is not always easy to sell new things to the first customer, but after a while, when the trade has been sufficiently cultivated, the trouble ceases and the goods sell themselves.

It is not such a difficult task after all,—that of guiding and directing the course of the tastes in one's trade. A few timely words, a fair stock in hand to show, a few sales for reference, and the ice is broken. Why so many dread to introduce new articles is the doubt and uncertainty about their being favorably received at first. Yet not a few merchants have confidence enough in themselves to assert that they can sell anything, which, so far as they are concerned, is probably the truth, for a good salesman who has sufficient hope and assurance can sell almost anything he undertakes to dispose of.

The hardware merchant should take pleasure in being the cause of introducing new and improved articles to his trade. If by his means the homes of his patrons are beautified and made more secure, the toils of the housewife lessened, or the comforts of the home increased, the labors of the farm made lighter, and turned into more useful and economical channels, certainly his endeavors have borne good fruit. When a man can be a public benefactor and still make money by so being, it should require little pressure to induce him to become one. To be enabled to educate the public taste is a matter of no small importance. The quiet and unobtrusive work of the merchant is no less beneficial—often far more so than that of a noisy orator. The dealer too often forgets that he is something more than a mere merchant—he is a part of the community; he is an important factor in the civilization that surrounds him; he can be useful to his neighbors and those who dwell within the circle of his usefulness. He should remember that there is something higher than the mere matter of money making. In the conduct of his business, he should strive not alone to amass riches, but to be serviceable to his friends—to the community about him. Having this in mind he becomes a useful member of society, an aid in the elevation of the taste and comfort of his fellow-men. Dealers imbued with such a spirit would seek to introduce the best and most serviceable articles—would strive to culivate a better taste among their followers—would endeavor to give not only value received for every dollar dropping into their tills, but the *best* value received which they could give. A trade built up in such a spirit would be profitable alike to seller and purchaser.—*Industrial World.*

PLATE 7.—SEE "OUR ILLUSTRATIONS."

THE May number of the *Decorator and Furnisher* is one of the most attractive and complete that this beautiful magazine has ever issued.

A magnificent new cover, designed and drawn by Sarony, is the first noticeable improvement. In addition to the usual full quantity of articles and illustrations for the aid of those interested in house decoration and furnishing, either in the trades or as amateurs, there is a magnificently illustrated article upon the 7th Regiment Armory, giving six rich half-page views of the most noticeable rooms, and an interesting description. There are seven pages of original and useful designs for ladies' work with full explanatory text. A full page colored plate for ceiling decoration, and an elegant supplement entitled, "*The Spirit of Night*," by Napoleon Sarony, printed upon heavy plate paper, are presented to every purchaser of this May number. Among the many other articles and designs are several upon Decoration Day, Ceiling Decoration Academy Exhibition, Novelties in Styles, etc., etc.

Published at 30 E. Fourteenth Street, New York City.

SEWER GAS A CAUSE OF MEASLES AND PNEUMONIA.—Attention is called by the *Sanitary World* to an extraordinary outbreak of measles among the children of a public institution, caused by sewer gas. The medical officer states that in the early part of October the drainage became choked, and the sewers had to be opened. During the progress of the work the house became filled with sewer gas, and for some hours the evil was almost intolerable. Thirty-one days afterward an outbreak of measles and pneumonia took place, the whole of the children, twenty-five in number, being almost simultaneously affected. There were four deaths, and the cases were of a severe type, with high fever. While lecturing on healthy houses to the students of the Woman's Medical College this season, the subject of sewer gas came up for some remarks, when one of the students, whose husband is a physician, remarked that she had two children. The bedroom in which they slept had the ordinary wash-bowl, with faucet for hot and cold water. The children coughed considerably during the night, and suffered with sore throats most of the time. The husband, suspecting that sewer gas might possibly enter the room from the water pipes during the night, had them closed. The result was, the coughing ceased at once, and the children have not been troubled with it since.

False Tenders.

THE question of tenders is daily becoming a matter for most serious attention. A glance at the published offers made every week, where there is often a disparity of half, sometimes of three-fourths, between the amounts of the highest and lowest tenders, show that there is something radically wrong. Either the one tender is too high or the other is too low. No mistake can have been made in the estimates, for the same specification has served on a basis for both; beside there is the fact that these low tenders are not occasional, but so common that many plumbing firms of long standing, skill and respectability, are now refraining from taking part in public competition altogether, convinced that their exertions are useless. Tenders made by such firms with the utmost care, and with the alloyance of only the smallest margin for profit, are beaten by others which offer at less than half the amount. Either the former do not know their business—in which they have grown gray—or these tenders are made below cost price, and with no intention of fulfilling the terms of the specifications.

Though that may seem strange, yet there are firms who put in low tenders for the "mere love of business"—to get the name of doing certain work, perhaps—and who faithfully discharge the terms of their engagements. But these firms are extremely few. The bulk of the low tenders are made by firms who cannot possibly do the work indicated at the price they tender for it, always understanding the employment of the best of skill, workmanship and material in its execution. This is what is looked for from them by the customer; but as they have no special sources of cheap labor and material which the respectable firms aforementioned have not, they can no more respond to the common sense stipulations of the specifications than do any other impossible deed. The way the specifications are attempted to be carried out is by the employment of inferior technical oversight, or of even none at all, of low-class material, and of unskilled workmanship. Work thus executed, in the end costs far more than the sum represented by the difference between the highest and lowest tenders, and is a fruitful source of the bad building and unsanitary work which abounds around us, not to speak of the discouragement to honest labor which results therefrom.

Remedies for this state of things which affect only the quality of the workmanship, do very little in mitigation of the evil; what is really wanted is a remedy vastly more far-reaching. It is to be found in simply obtaining the services of some competent arbiter between customer and tradesmen. Such a man is in general the architect and if his estimate of the cost of the work were made the universal basis or test—instead of the exceptional one, as now—of valuation of contract work, there would be an end at once to the evils of the present system, both as toward the trade and the public. The architect's estimate would be a guide—not necessary infallible—to the public as to the approximate cost of the work sought to be executed, done in a workmanlike manner and with sound materials, in accordance with the intentions of the customer. Tenders much below that would be recognized as being impossible of execution in the sense intended by him. On the other hand, an opposite check, on exaggerated tenders, which the competition system is considered to afford, but which in many cases it does not, would be provided.

The competition system is a good one, but it is capable of abuse at its two extremes. With the checks we have suggested honest trading would be fostered, and the indiscriminating public protected, while bad workmanship and dishonest trading would be discouraged.—*The Builder and Wood-Worker.*

Merit starving in a garret is very pathetic and romantic, but merit battling with the world for recognition is manly and admirable, and deserves all the credit its hearty self-reliance is certain to win for it in the end.

Beautiful surroundings inspire pleasure insensibly. The author can write, the artist can paint better in a comfortable studio than in a bare garret. The beatification of life is a duty every man owes to himself, and the readiest way to beautify life is to live it in an atmosphere of refinement and intellectual enjoyment. The mind has an appetite as well as the body, and it must be fed as regularly through the eye as the stomach is supplied through the mouth.

MASONS' AND BUILDERS' EXCHANGE
OF SAN FRANCISCO
Room 11, 314 Montgomery St.

BELOW will be found a list of the members composing this Exchange. Boxes are provided for each member, so that architects, owners, or others desiring the services of any particular member, or those having boxes who are not members, and yet whose business is directly connected with that of the Exchange, can readily secure the attendance of the party sought, by leaving a note in the respective boxes.

Wrong Statement Corrected.

A bill recently passed by the California assembly gives to any young man under twenty-six years of age, who learns a trade by serving an apprenticeship for three years, and is a moral young man, $250 out of the State treasury.

The above article we fine in a late number of the *Building*. The statement contained therein is decidedly erroneous. The bill, although introduced, was, to use a senator's phrase, "ridiculed into a side pocket," and never had the remotest chance of becoming a law.

BUSINESS NOTES.

Wood Filler.—This celebrated preparation—"WHITTIER'S PATENT WOOD FILLER"—is justly earning a reputation for its superior qualities in rendering red and other soft woods capable of receiving a high degree of finish. It is also applicable to hard woods, and is about the only article that gives a durable, economical, natural and perfect finish. Pamphlets giving information in regard to this preparation, may be obtained by addressing the Bridgeport Wood Finishing Co., 40 Bleeker Street, New York City.

Mechanics' Tools.—Osborn & Alexander are the accredited agents for all new designs and inventions in the line of Mechanics' Tools. Send for circulars to 622 Market Street.

Elevators.—Write to John Hammond, 42 Beale Street, agent for the Otis ELEVATOR, and you will receive circulars giving full description of the best elevator now in use.

Window Glass.—F. H. Rosenbaum & Co., 567 Market Street, are the agents for all the best brands of window glass. They also make a specialty of looking glasses, and will furnish any size and quality to order.

Builders' Hardware.—Dunham, Carrigan & Co. have the largest assortment of any firm on this coast. Their assortment of locks is superb. Call on or write to them for information.

Wood Mantels.—Call FIRST on the Boller Mfg. Co. warerooms, corner of Turk and Taylor. We say FIRST, because after inspecting their stock there will be no necessity of inquiring any further.

Pan Closets.—Jos. Budde, 126 First Street, manufactures the best Pan Closets. Write to him for particulars.

Paints and Oils.—Par excellence is the brand on every keg of paint and barrel of oil that is furnished by the well tried and proven firm of Sullivan & Ravelen. The latter gentleman was formerly the manager of the first lead company started on this coast, and his thorough knowledge of the qualities and materials necessary to produce a superior article of paint, makes him peculiarly fit to be at the head of the GERMANIA LEAD CO. Try the Germania Lead, and you will always give a second order for the same brand.

Where owners' names are left blank, it is so done in many instances by special request.

The building, reported in our last issue, on Jackson Street between Fillmore and Steiner, should have been credited as follows:

Oakland—20th Street and 13th Avenue; O., J. Valentine, $20,000.

The change will be noticed in our semi-annual report.

Hayes, corner Buchanan. Two-story frame. O.—Simpson Memorial Med. Church. A.—J. Maquis. C.—J. A. Leonard. $30,000.

Franklin, near Turk. Six two story frames. O and B.—J. R. Mitchell $25,000.

Eighteenth, nr. Guerrero. Two-story frame. O.—F. J. O. Wilke. A.—Kenitzer & Raun. C.—Conrad & Miller. $15,000.

Scott, between Waller and Haight. Eight two-story frames. O and B.—J. Hinkle. $30,000.

Bush, between Larkin and Hyde. Two-story frame. O.—Rev. Dr. Noble. C.—S. T. Green. $5,000.

Bush, near Hyde. Three-story frame. O.—A. Paturel. A.—G. E. Voelkel. C.—J. McKay. $10,000.

Clay, near Lyon. One-story frame. O.—M. s. J. Murphy. C.—Patterson & Smith. $1,500.

Capp, nr. Seventeenth. Alterations. O.—J. Doran. C.—William McKaon. $2,000.

Capp, corner Seventeenth. Two-story frame. O.—J. Laughmane. A.—M. J. Welsh. C.—Cormack & Elam. $4,000.

AND

BUILDING NEWS

Published on the 15th of each month

BY THE

San Francisco Architectural Publishing Co.

Rooms 11, 12, 13, No. 240 Montgomery Street.

TERMS:

PER ANNUM $2.00 IN ADVANCE

ADVERTISING RATES.

Front Cover, outside, each insertion, $2.50 per square.

Back Cover, outside, each insertion, $2.00 per square.

Page preceding reading matter, $1.75 per square.

Page following reading matter, $1.50 per square,

Inside Pages, each insertion, $1.00 per square.

Full Page, inside, one insertion, $40.00.

Single insertions for small ads, double above rates.

A square is seven-eighths of an inch in length by width of column.

Advertisements alone inserted that refer to materials used in the construction and furnishing of houses, and to matters and trades belonging to the building interest.

NO OTHERS RECEIVED.

A Splendid Semi-Annual Showing of Building Activities and Investments in S. F.

THE break in building operations, anticipated and prophesied by many, has not as yet put in an appearance in any tangible form, as our report for the current month not only shows no falling off, but an increase over the preceding month of May, and largely in excess of the same month of 1884, while the present summary for six months of the current year

SHOWS A GAIN OF

$1,267,889

OVER THE FIRST SIX MONTHS OF 1884,

AS FOLLOWS:

First quarterly report of 1885, ending with our March issue, 288 building engagements, value	$2,069,261
Reported in April issue, 178, value	1,221,045
" " May " 127, "	577,843
" " June (present mo.), 148, val.	588,410
Total, 6 months, 1885	$4,456,559
" " " 1884	3,188,670
In favor of 1885	$1,267,889

No better indication of the real financial condition of the inhabitants of San Francisco can be had than the figures and facts above given. The great majority of building movements have been, and are, prosecuted upon the solid basis of cash in the hands of owners. The amount of borrowed capital is comparatively light, showing that an era of general prosperity has existed among the "common people," from the well-to-do and more favorably circumstanced down to those who toil with the hod, hoe, and shovel, hundreds of whom have provided themselves with comfortable homes, and many accumulate enough to invest in improvements for renting.

But it would not be reasonable to expect an uninterrupted continuation of this great increase, augmenting more than

TWO AND ONE-HALF MILLIONS PER ANNUM,

And no discouragement should be experienced by any one should there be a considerable letting up during the remaining months of 1885. But as all prophesyings and prognostications upon this subject have failed, the man who can tell just what will be in the future, and when the building interest will subside to a condition of comparative or positive dullness, must possess greater wisdom and penetration of judgment than the knowing ones who have from time to time predicted that the march of improvement was being forced and must halt. But with all this grand increase in the number of buildings erected in San Francisco, the "to let" signs do not appear to multiply, nor are rents affected thereby so as to make it unprofitable to owners to build; and so long as people can improve their lands so as to yield returns greater than bank interests—often nearly twice as great—there is no danger of the building interests paralyzing.

Building Interest in Woodland and Yolo Co.

TO THE EDITOR OF THE "CALIFORNIA ARCHITECT AND BUILDING NEWS:" Three more months, with all its cares and anxieties, have passed since we turned in an account of the building progress of our city and Yolo County, and you will see by the following that we have at least held our own and kept the building interest alive, and now return a fair showing of the number of houses and improvements erected and those in course of construction, lending assurance that we are enjoying a liberal amount of prosperity. Still we would refrain from overestimating in our midday prosperity, and let the figures pass at par value, simply remarking that the second quarter of 1885, in number of buildings and values, is ahead of any before reported since 1880.

The grade of work and buildings erected embodies a fair degree of actual solidity, promising long endurance, with sufficient architectural refinement to figure substantially in the make-up of our city, with houses not constructed for the present, but for time, which seems to say, "Let not the form of shallow mockery become a part of this solid house."

The number employing architectural service is more in proportion than at any previous time, and the structures, as a whole, are more costly, with several worthy of special mention. The Gable Brothers' villa and John M. Briggs' residence on First Street are two, the aggregate cost of which will undoubtedly exceed $40,000.

The following is the number of buildings and improvements of all classes for the past three months:—

CITY OF WOODLAND.

26 Frame buildings, costing	$77,800
1 Brick building, "	5,500
6 Improvements, "	7,000
33 Buildings and improvements; total for city	$90,300

YOLO COUNTY.

8 Frame buildings, costing	$16,000
1 Brick building, "	12,000
2 Improvements, "	2,300
11 Buildings and improvements; total for county	30,300
44 Buildings and improvements city and county, final aggregate	$120,600
Final aggregate for corresponding three months of 1884 (25 buildings)	79,782
Increase in number of buildings, 19; in value	40,818

Should this meet favor with you, we may try again, although we distrust our competency to furnish such suitable material for your valuable columns as will be of sufficient importance to interest your many readers. Accept our thanks for past courtesies and favors. Respectfully yours,

GILBERT & SON.

June 4, 1885.

To Polish Zinc.

TAKE one part of muriatic acid to two parts of water, scour the zinc well with this mixture and fine sand, then dry carefully and give a thin coating of oil.

Carpenter—Building Contractors' Organization.

THE master carpenters in San Francisco—at least a majority of the leading and more responsible of their number—have formed an organization, and adopted rules and regulations which will to a considerable extent, if enforced, change some of the practices hitherto prevailing in connection with the erection of buildings. The movement is based upon the experiences of the past, without any harshness of expression, or seeming disposition to antagonize either owners or architects. They simply state in their own behalf, what they will and will not do; to wit, they claim the right to exercise exclusive control over all matters for which they, under the contract, are responsible; to purchase all materials of any nature and kind, necessary to the fulfillment of, and the use of which is included in their contract obligations; that owners who segregate and reserve to themselves the right to furnish mantels, glass, and other things, must be responsible for the safety of the same, and make good, at their own expense, all breakages and damage that may occur thereto; that the purchase of lumber and other constructive material is a privilege which the contractor should enjoy, together with such financial advantages as are to be derived from skillful management, judicious purchases, good credit, or ready cash.

OWNERS HAVE PROVOKED IT.

The general rule adopted for years in this State in letting contracts for buildings of any importance, has been to let each principal mechanical branch separately, and purchase a considerable portion of the materials. If this had been confined within reasonable and legitimate bounds, the present move of the carpenters would not have been thought of. But some owners, and many of them the wealthy, millionaire class, imagining financial savings by segregations and purchase of materials, have gone beyond all reason, and reached for every dollar possible of being saved, until master contractors have justly felt themselves deprived and cut off from many of the rights and proper advantages which should accrue to them, as legitimate compensations for the special skill and abilities necessary in the prosecution of works for which they are obligated, and the seen and unseen responsibilities which must and does always attach in the honest carrying out of constructive works. This spirit of going for every dollar in sight by owners

IS INDUCIVE OF IRREGULARITIES.

As in all other, so in the building business, there are regular and right profits, and legitimate and reasonable advantages, to which no right minded owner should object. When the erection of buildings is submitted to competition among a number of good, responsible, and competent men, whether as a whole or by segregations, the owner should be content with the competitive advantages secured, and leave those which are further possible to the lowest bidder, to his benefit, as a business right, without seeking further advantages, by cutting off every chance on the part of the contractor to secure more than the closely figured result of actual, personal, or hired labor; and making the master mechanic a mere contingent, full of responsibilities, but curtailed of the legitimate financial results which should be reached, in compensation for skillful management, careful purchases, and the risks involved in every building operation.

A CITY AND STATE BUILT OF WOOD MATERIALS.

Owing to the fact that the early buildings and constructions in San Francisco, and California generally, were almost exclusively of wood materials, the carpenter contractors naturally became, and were recognized as the right and proper parties to control and manage building matters generally; and as a rule, for many years, contracts, as a whole, were let to them, and they in turn sub-let the various branches to whom they pleased. But unfortunately for the craft, thousands of unscrupulous fellows who never spent an hour in servitude to acquire a knowledge of the business, nor possessed the first degree of mechanical competency, crept into the business, and aped the *master*, while in fact but mechanical *ninnies*. San Francisco has been at times "full" of this class, and thousands of villainous things have been done by them, and hundreds of thousands of dollars lost to subcontractors, material men, and others, through the misdoings of this renegade class. Consequently, organizations have from time to time been formed by the various classes of mechanics, and owners have made purchases to protect themselves against the uncertainties of this condition of things, and segregation and original contracts with owners have been demanded by nearly all the principal trades. Even the roofers, stair builders, and lesser operators, from feelings of uncertainty, have clamored for separate contracts, to save them from the clutches of those who have disgraced and injured the reputation of carpenter contractors, and reduced it to a most humiliating level. But the unreliable class has largely disappeared, and the better men are, by the movement noticed, seeking to rebuild and restore the broken down places, and elevate the science of building construction to its honorable place in the business world of San Francisco.

The restrictions and curtailments which have been practiced, were not aimed at, but to a very great extent affected the good and reliable men; as a general rule or law governing in such cases, unless made direct and personal in character, could not otherwise, than to some extent at least, attach to all within the same circle.

The movement calling forth this article has in it the argument of personal vindication and honor; that of men vindicating their rights, and asking honorable recognition as competent and qualified parties to assume all the responsibilities involved in the prosecution of their avocation, seeking no more than all other good business men demand,—the right to manage and control all matters which involve them in responsibilities.

This new departure, however, will naturally disturb and dam up some of the business rivulets that have hitherto flowed through the fields of building operations. Dealers in building materials have appreciated the safety assured to them, by selling directly to owners, as security against trading with men of uncertain responsibility, realizing the fact, that many who operate as building contractors are not financially reliable, however honest in principle and purpose they may be; that *honesty*—a priceless possession in itself—is worthless, as against bills and notes due and payable, unless there is a coin backing to sustain the moral feature. Consequently it will become necessary for owners who recognize the rights claimed by the contractors, to be very careful in letting contracts so as to avoid mechanics' liens, and material men will be required to exercise the strictest scrutiny into the responsibility of those to whom they sell material otherwise than for cash on delivery. But as there are a sufficient number of competent and financially, as well as mechanically, qualified contractors to encompass the whole business, there is no good reason why the interests to both owners and material men may not be made secure.

The Amended Lien Law.

FROM first reading of the amendments to the Mechanics' Lien Law, passed by the last Legislature of this State, we supposed that they were the concoctions and emanations of some undeveloped "country member's" brain, who had no proper knowledge of the mechanical trades, nor had ever read intelligently any lien law or law book of any kind; and that the members of the honorable body approving the same, were still suffering from the *fatigues* of the previous night, at the time of passage of the bill. But when informed by good authority that a S. F. attorney of considerable repute as a lawyer generally, and in lien law matters particularly, had been paid by interested parties to prepare some practical amendments, consistent with the principles of common law, we had no more to say. Our faith in the infallibility of the legal profession as a whole, not *one* excepted, was terribly shaken, and we settle down in the belief that it is even possible for a clever, intelligent lawyer to do a silly thing.

The law as amended is made cumbersome and inconvenient, and, in material respects, illegal and therefore void, and so the Supreme Court will decide whenever certain parts are submitted to that tribunal. But in the mean time, thousands of parties operating in building construction will be subjected to provoking annoyances, while the interests of but few, if any, will be made more secure. Their author must have known that in parts, at least, the amendments, as passed, where illogical and illegal, and that they would and will not stand the test of review by the court of last resort. It is to be regretted that the amendments as now recorded on the statute books of the State were passed, as they simply complicate matters and multiply difficulties, affording special security to those only who may gain points under them until they are nullified by appeal to the Supreme Court.

S. F. Chapter as a Live Institution.

IT is pleasing to notice the spirit and interest manifested at the Chapter meeting, held on the 5th inst. The attendance was most gratifying, and the proceedings of such character as to justify the hopes so often expressed in this Journal, that it is only a matter of time when the Chapter will become an influential and eminently useful organization. As a result of its existence, the architects of this city and State are better known to, and understood by each other, than would have been the case in the next ensuing quarter of a century, or has been prior to its organization, since the founding of the State.

The prediction of failure so freely prognosticated at its inception, having so signally proved an error of judgment, if not a *mis-desire* on the part of those who refused, and still refuse to co-operate, should satisfy all that there are at least some in the profession who have added works to faith, and that the seed sown years ago, in a not too fertile soil, is still healthy and putting forth buds with the promise of rich, ripe fruit in the future. Brethren of the profession—those who have—work on; the labor so employed will yield its return; and to those who have not joined the effort to be good to themselves and their brethren, we say in all kindness, lay aside your prejudices, personal or otherwise, and atone to yourselves for what you have lost, by earnest co-operation in the future. It must by this time be apparent to any reasonable minded man that the organization of the Chapter was not for individual purposes, nor from personal incentives. Its work has been general and for the good of all. Its influence has helped even those who have withheld a helping hand, and the profession to-day stands in better light before our clients than it would have done had the Chapter not existed. The kindly interchanges of views, the familiar intercourses between members of the Chapter, and its purifying and rectifying influences, have relieved the profession to a large extent from that cold indifference and jealousy which, prior to its organization, overhung and beclouded the relationship between men who should never have entertained an unkind sentiment toward each other.

Much is promised for the next meeting, and it is hoped that a grand rally of the members will be realized, and that some of the few good men who have not, will send in their application for membership, and be present in person.

Cabinet work of a finer description requires a more than ordinarily lustrous polish. The following is recommended for delicate work: Of linseed oil, half a pint, and the same quantity of old ale, the white of an egg, one ounce of spirits of wine, and one ounce of spirits of salts. It should be well shaken before being used, and a little should be applied to a soft linen pad and lightly rubbed off with an old silk handkerchief. If kept in a bottle well corked, this polish will keep any length of time.

Compressive Strength of Brickwork.

THE subsidence and failure of lofty chimneys erected for manufacturing purposes might profitably suggest the importance of collecting data relating to the greatest direct pressure which shafts of masonry and brickwork can actually sustain with safety. The effect of the wind is a point that should not be overlooked in the construction of chimneys, although undue pressure is also caused by settlement, expansion by heat, &c. The *Building News*, of London, in considering the subject, gives some interesting figures relating to high chimneys in different manufacturing centers, and to the pressures exerted by them. Thus, for example, it mentions a chimney at Edinburgh, 341 feet high, and resting on a hard clay shale. It is 40 feet square at its base, and, according to one authority, exerts a pressure amounting to 2½ tons per square foot. The brick shaft above the stone pedestal exercises a pressure at the base of 8 tons per square foot, while the strength of ordinary brick has been estimated at from 20 to 30 tons per square foot. As a further instance our contemporary cites a chimney at Birmingham which is 312 feet high, the pressure on the base being 6 tons per square foot, and on the foundation below the footings, 1½ tons per square foot. Another chimney, 145 feet high, exerts at the base a pressure of 8½ tons per square foot of the hexagonal base. A glass-house cone, 75 feet high, had 4 tons per foot on the piers between the arches, which is thought as much as should be allowed where the brickwork is exposed to great heat. The great chimney of St. Rollox, near Glasgow, is 455 feet high, and is 41 feet in diameter at the base, diminishing to 13 feet at the summit.

So long as the pressure is not greater than one-twelfth of the ultimate resistance of the material, there need be little anxiety felt; but accidental causes, such as wind, leaning from a yielding foundation and settlement may bring the pressure on some portion of the beds to within a limit at which the structure would not be safe. Inferior bricks are often used in construction of this kind, and when these are used in the foundations or base, the margin of safety becomes considerably diminished. In the oversetting tendency of wind on a high pile of brickwork, the pressure is suddenly shifted to one side, the leeward, and if the resultant approaches the outer face of the work, the pressure may be so increased as to cause a bulging or crushing at the joints, such as was observed in the chimney at Bradford, England.

A mixture which is said to be a cure for undue perspiration of the hands, is made of a quarter of an ounce of powdered alum, the white of one egg, and enough bran to make a thick paste. After washing the hands, apply this; let it remain on the hands two or three minutes, and then wipe off with a dry, soft towel. Lukewarm water is better than hot or cold, if the skin is tender, or inclined to chap.

Slate.

THE advantages possessed by slate as a roofing material are, (1) its comparative cheapness, (2) fire-proof quality, (3) cleanliness, (4) appearance.

First, its cheapness is apparent upon inspection of these comparative figures, as obtained from a recent publication, which, however, are subject to slight variation:—

Slate per sq. (10 ft. sq. or 100 sq. ft.)				$4.50 to $5.00
Boards	"	"	"	2.00
Tin	"	"	"	5.60 to $6.50
Shingles	"	"	"	4.00
Corrugated iron	"	"	"	6.00

Exposure to the weather effects these materials very differently. Slate remains firm and water-proof indefinitely (at least sixty or seventy-five years and longer); boards are efficient eight years, tin nearly twenty, shingles twelve, and iron lasts about twenty years, making a yearly cost per square of 7½ cents for slate, 32½ for tin, 25 for boards, 33⅓ for shingles, and 30 for iron. To secure the correct service for the periods named, these substances, with the single exception of slate, must be painted at intervals of four or five years, entailing additional expense.

In communities where cistern water is used, there is no possible doubt of the supreme advantage slate offers as a surface over which rain water should flow. Its cleanliness and freedom from disintegrated particles of poisonous paint and vegetable growth incident to other materials, especially wood, clearly establish the fact. It is practically fire-proof, and presents a beautiful appearance in its place.

A square of slate is a quantity sufficient to cover a space ten feet by ten or 100 square feet. The number of slates required in each size for such square is

28x14	83	16x12	185
26x14	89	16x10	222
24x16	86	16x 9	247
24x14	98	16x 8	277
24x12	115	14x14	188
22x14	109	14x12	219
22x12	127	14x10	262
22x11	138	14x 9	291
20x14	122	14x 8	328
20x12	142	14x 7	375
20x11	155	12x12	267
20x10	170	12x10	320
18x12	160	12x 9	355
18x11	175	12x 8	400
18x10	192	12x 7	458
18x9	214	12x 6	533

The weight per square varies from 550 to 650 pounds, but is generally quoted at six hundred pounds for No. 1 slate.

Slate is largely used as a material for mantels, hearths, tiles, steps, sills, lintels, coping, flagging, and other structural articles. Grave boxes made of this material to hold the casket or coffin in place of wooden cases are growing in favor in the United States.

To remove varnish without injuring paint Brush on spirits of ammonia or hartshorn, which soon softens the oil, allowing of its being rubbed off easily.

Sewers, Gases and Sewerages.

[Written for this Journal by F. Hillert, Architect and Mechanical Engineer.]

PHYSICAL and chemical laws governing the creation and motion of gases from animal and vegetable matter applicable to sanitary

PLUMBING WORK.

Gases are either permanent or vaporous; the first cannot be converted to a fluid condition, while the latter may, by the negative action of heat, or by pressure, be reduced to a fluid state; both are expanded by heat, and the density is in the reverse ratio to its volume; by reason of the mobility of their molecules, must be enclosed or surrounded.

The organic combinations of animal or vegetable matter of the waste are composed of the chemical elements of carbon, besides oxygen, nitrogen, sulphur, phosphorus, etc., in such a manner that one or more of these elements in the organic bodies are missing.

The animal and vegetable matter to be carried off by waste and sewer pipes is first deodorized and dissolved by the water, and in solution conveyed away to fulfill its work in the laboratory of nature, or may be, and is in some places converted, by chemical process, to fertilizers of considerable value. The parts not readily dissolved are rotted or decomposed slowly, at a temperature between the boiling point and the freezing point of water, creating from the component chemical elements of the residue, carbureted gases, and some of the lowest (microscopical) animal and vegetable organizations, which frequently form the germs of contagious diseases and epidemics. The gases created therefrom, either pure, diffused, or mixed, are:

1. Carbonic acid gas ($C O_2$), which is a colorless gas of a pungent, sour taste, suffocating, and of 1,524 density, atmospheric air taken at a unit, one volume of water will absorb 1.06 of this gas to saturation, and by its density will gravitate and descend in soil and waste pipe through the lighter atmospheric air similar to water. A pipe filled with this gas will, by its density, have a small inside pressure in excess over the outside atmospheric air pressure.

2. Hydrogen gas (H) is colorless, odorless, and a permanent gas of 0.0692 density, combustible, burns, and unites to water, when brought in contact in the presence of atmospheric air with a burning body, creating a high heat with a non-shining light. One volume of water absorbs only 0.156 of gas; is raised by its density by natural current, through the air in a $\frac{40}{30}$ (respectively) feet long upright pipe with $\frac{15.24}{41.14}$ (respectively) feet velocity per second, and conveys away per minute $\frac{60.78}{51.50}$ (respectively) cubic feet of gas, or $\frac{0.34}{0.32}$ (respectively) lbs. through a two-inch pipe usually used in our plumbing work. A vacuum will be filled by the atmospheric air at a rate of 1,275 feet velocity per second.

3. Hydrocarbureted gas ($C H_4$) occurs in mines as fire-damp; is colorless, odorless, and a permanent gas, suffocating and of 0.55 density, burns with a bluish flame; one volume of water absorbs 0.037 of gas; it ascends by its density in a $\frac{40}{30}$ feet high pipe, with $\frac{33.52}{29.01}$ feet velocity, and a two-inch pipe will discharge through air $\frac{42.23}{36.55}$ cubic feet, or $\frac{1.75}{1.60}$ lbs. of gas per minute.

4. The heavy hydrocarbureted gas ($C_2 H_4$) (oilfiant) is colorless and of a light smell, suffocating, and of 0.94 density, combustible, and burns with a bright flame; one volume of water absorbs 0.155 volume of gas, and ascends by its density in a $\frac{40}{30}$ feet high pipe with $\frac{11.85}{10.59}$ feet velocity, and a two-inch pipe will discharge $\frac{11.85}{10.59}$ cubic feet, or $\frac{1.06}{0.98}$ lbs. of gas per minute.

5. Hydrosulphuriatic gas ($H_2 S$) is colorless, and of a strong smell of rotten eggs and is of a poisonous action on the organization, and when ignited with a burning body burns with a bluish flame; is of 1.19 density; one volume of water absorbs from 2 to 3 volumes of gas. Its presence is detected by its smell, and by coloring silver and white lead, when brought in contact, brown or black, being heavier than air, will descend.

6. Ammonia ($H_3 N_2$). Hydrogen and nitrogen will unite, when becoming free by decomposition of organic substances containing nitrogen; it is colorless, of a peculiar smell, of 0.59 density; it has a highly absorbing quality, one volume of water absorbs 670. volumes of gas, and will ascend in a $\frac{40}{30}$ feet high pipe with $\frac{31.94}{27.87}$ feet per second, and a two-inch pipe will discharge $\frac{40.20}{34.80}$ cubic feet, or $\frac{1.80}{1.30}$ lbs. per minute, and other gases and vapors of bad odor having solid matter, and matter of parasitic and fungal organization microscopically suspended, and for the present purpose of investigation, conveying them from the place of creation by natural current, may be classified as having the same physical and mechanical properties.

If the gases created do not readily escape, but intermix (having no chemical affinity), that two or more of them will fill the same space, increasing the density of them in this space; assuming this mixture having a density of 0.60 than the same will pass through a $\frac{40}{30}$ feet high two-inch pipe with $\frac{31.62}{26.50}$ feet velocity per second, discharging $\frac{57124}{48102}$ cubic feet, or $\frac{2751.95}{2313.21}$ lbs. per twenty-four hours, namely, $\frac{2741.95}{2318.21}$ lbs. of solid matter, or waste, converted to gas, will be discharged in this form through a $\frac{40}{30}$ feet upright two-inch pipe which is of sufficient capacity to ventilate and clear one hundred houses. It is not correct, and is injurious to have the ventilation pipes excessively large.

The amount of discharge may be artificially increased, by passing heat in the form of hot air, steam, or by a gas jet into the ventilation or sewer pipes, and it is a gross error to prohibit this by law.

Since the current of gases inclosed by pipe, increases with the height of the same, the sewer, waste, and ventilation pipes, and rain water conductors should run uninterrupted continuously from the main sewer-pipe of the street up to above the house-roof. The different discharges from sinks, etc., must be trapped, to shut off any air from the inside of the house to the pipe, then the flow of the gas created in the trap will be taken and drawn up by the existing uprising current. It is an error to intercept this current by the insertion of a slop-hopper, which, by the consequent decrease of the current of gas, the saturation of the water-seal by sewer gas, the decay of matter in the slop-hopper, hastened by standing on low ground, exposed to the sun's rays, is a source of danger to the people occupying the premises.

The manner of ventilating the sewer-trap in front of the house through the sidewalk is of a very doubtful utility, as the elements for producing a natural ventilating current are missing. The gas, if any, should be conducted to above the house-roof, and not on the street in the wake of men.

For the capacity of the sewer-pipe, and the material the same is made of, be it noted that a six-inch pipe, smooth inside, fifty feet long, laid with a ten-inch pitch, will convey nearly three thousand gallons of water per minute, with 3.39 feet velocity per second, and with a ten-foot perpendicular extension, ten thousand one hundred and twenty gallons per minute, with 22.49 feet velocity per second. A four-inch pipe, under the same circumstances, will convey four hundred and fifty-eight gallons with 2.95 feet velocity, and respectively one thousand four hundred and ninety-six gallons with 9.57 feet velocity, large enough to drain a dwelling-house of ordinary capacity, provided that there is a usual amount of water used for slushing, and the sewer not wantonly misused. Clay pipe is indestructible in water, acids, fatty and oily substances, and has been used as pottery for ages past for cooking purposes.

Tar, pitch, asphaltum, and its kindred substances are the natural or artificial products of dry distillation of coal or wood, of a hydrocarboniferous composition; they are insoluble in water and in non-concentrated acids, but easily soluble in lye, spirits of wine, ætheric and fatty oils; but since in every household alkalies and fatty oils are extensively used, the inside coating of the iron pipes used for sewer-pipes will be dissolved, and the iron of the pipe exposed to oxidation and rapid destruction, entailing new expenses and trouble to our house-owners.

From the above, it can be no trouble by an educated and paid Board of Health, with the aid of the exact sciences on chemistry and mechanics, and some scientific experimenting on the subject-matter, to formulate a plumbing law, wherein, according to the amount of waste decomposed and to be conveyed away, the size of pipe to be graded and the most suitable material for it selected, that with good workmanship an effective, suitable and economical house-drain can be constructed, when house-owner and mechanic, comprehending the problem and its utility, will cheerfully assist and aid in the execution of the law, when they can see that the same is intelligently made for their benefit, and not in an arbitrary interest of the supplying material men for a market of their ware. The owners submit and avoid legal expenses, as by process of law no better details can be obtained.

Sunny Rooms Make Sunny Lives.

LET us take the airiest, choicest, and sunniest room in the house for our living room—the workshop where brain and body are built up and renewed; and there let us have a bay-window, no matter how plain in structure, through which the good twin angels—sunlight and pure air—can freely enter. This window shall be the poem of the house. It shall give freedom and scope to the sunsets, the tender green and changing tints of spring, the glow of summer, the pomp of autumn, the white of winter, storm and sunshine, glimmer and gloom—all these we can enjoy as we sit in our sheltered room, as the changing years roll on. Dark rooms bring depression of spirits, imparting a sense of confinement, of isolation, of powerlessness, which is chilling to energy and vigor; but in light is good cheer. Even with a gloomy house, where walls and furniture are dingy brown, you have but to take down the dingy curtains, open wide the window, hang brackets on either side, set flower pots on the brackets, and ivy in the pots, and let the warm air stream freely in.

The best paints for preserving iron exposed to the weather are prepared from the pulverized oxides of iron, such as yellow and red iron ochres, or brown hematite iron-ores finely ground, and simply mixed with linseed oil and a drier. White lead applied directly, requires incessant renewal, and, indeed, probably exerts a corrosive effect. It may, however, be applied over the more durable colors where appearance requires it. Red led is said to be very durable when pure. When the size of the exposed iron admits of it, its freedom from rusting may be promoted to a large extent by first heating it thoroughly, and then dipping it into, or washing it with linseed oil, which will then penetrate into the interior of the iron. For tinned iron exposed to the weather on roofs, rain-pipes, etc., Spanish brown is a very durable color. The tin is frequently found perfectly bright and protected where the color has been used, after an exposure of forty or fifty years. White paint washes off in a few years by the action of rain.

The following announcement appears in the last issue of our esteemed contemporary, the *American Architect:*—

"In view of the embarrassment in which the founders and late publishers of this journal find themselves temporarily involved, it may be well to forestall even the slightest agitation on the part of our subscribers or advertisers by saying plainly that the misfortune alluded to affects this journal only through the sympathies of its editors. So far as business relations go, the journal, under the same editorial management as always, will continue to fulfill all its obligations to subscriber and advertiser."

We congratulate the *Architect*, and join with its friends in best wishes for its continued prosperity.

Evolution of the Elevator.

I DO not know, nor does the Encyclopædia afford me any information, when the contrivance called an "elevator" or "lift" was first introduced into public use. I think, however, that it is of very recent origin, except possibly for hoisting freight, etc., when some lifting apparatus has, of course, always been necessary. But the passenger elevator certainly does not go back over half a score of years. It seems rather curious, therefore, to find in the "Greville Memoirs," in the account of a visit to Genoa, made by the author in 1830, the following note: "Called on Mme. Durazzo, and went with her and her niece, Mme. Ferrai, to the king's palace, formerly a Durazzo palace, like the others, a fine house, full of painting and gilding, and with a terrace of black and white marble commanding a view of the sea. The first picture is a Paul Veronese of a Magdalen with our Saviour. The king and queen sleep together, and on each side of the royal bed there is an assortment of ivory palms, crucifixes, boxes for holy water and other spiritual guards for their souls. For the convenience of their bodies he has had a machine made like a car, which is drawn up by a chain from the bottom to the top of the house; it holds about six people, who can be at pleasure elevated to any story, and at each landing place there is a contrivance to let them in and out." Certainly this was the precursor of the modern elevator, for it possesses all its essential features—much more so than the passenger car used in the torture-chamber of the Inquisition in the sixteenth century, which took in passengers, hoisted them up, and then had a bad habit of letting them out through the bottom and landing them on sharp spikes without consulting them as to when or where they desired to make a landing.—*Germantown Telegraph.*

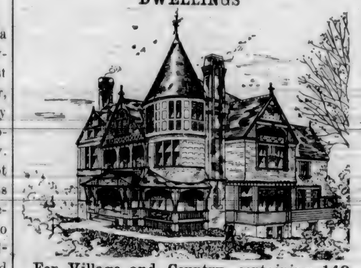
A Treatise on the Use of Belting for the Transmission of Power. By John H. Cooper.

IT has been the aim of the author, in this book, to collect, in the simplest manner, the opinions of practical and theoretical men. It also contains more *original* matter than any other book printed on the same subject. It is written in the plainest language, and is as easy to understand as any work of a technical character. In order to lessen labor, the author has introduced original abbreviations, such as, R p m for *revolutions per minute*, F p m for *feet per minute*, etc., the letters thus indicating the words. The difference between adhesion and friction is also clearly set forth. The chapter on *Use of Belting* is replete with a large array of facts and figures consistent with accuracy and in harmony with best use. It also supplies many helps in the shape of experimental data and practical working of belts.

The above work is for sale in this office and will be forwarded to any address upon receipt of the publisher's price, $3.50.

Village and Country Homes..... **$5.00**

DWELLINGS



For Village and Country, containing 149 illustrations.

The author of this work has followed an original plan in regard to its arrangement. Beginning with an "Asbury" cottage of three rooms, costing $700, he follows by gradual gradations with plans showing an increasing cost, until we find at the last end a seventy-five room "Orient," a duplicate of which will cost $20,000. Some of the names selected for the various styles of architecture shown are rather unique, such as "Stepping Stones," "Walking Ford," "Montclair," "Bayswater," "Islip," "Blackrock," "Mamaroneck," "Lillie Lake," etc.

The author has followed a plan suggested by this Journal some years ago in its article, "*Notice to Publishers*"—a full list of all the articles connected with the building, given with the cost thereof at time of publication, any fluctuations in the price of materials or labor, can readily be applied to costs as given in book, and a true estimate thus can be found.

The book is finely printed and can be seen at this office. Price, $3.00.

"Grimshaw on Saws."

FROM the publishers, Thos. W. Hartley & Co., 420 Franklin Street, Philadelphia, we have received a copy of the work entitled "Grimshaw on Saws."

We have examined the book critically, and are satisfied that the author has done himself much credit in its production. He has drawn liberally upon numerous and widely spread sources of information, intelligently classifying the different varieties of saw-teeth and blades, and going thoroughly into the details of saw manufacture, from the making of steel to the final finish.

The author has taken much pains to impartially select examples of the various manufactures of those who make saws a specialty. We notice that the *N. W. Spaulding inserted teeth* and the productions of the *Pacific Saw Manufacturing Co.*, of this city, receive liberal notice and are well illustrated.

The chapters on files and the setting of saws are very interesting, and every carpenter and mill-man would be greatly benefited by a careful study of these sections.

The work is beautifully printed on heavy book paper. THE PRICE IS $4.00, upon receipt of which a copy will be sent to any address.

Where the Architect and Plumber Meet

First in the architect's office, when the specifications for the work are open for bids. Many architects, when they are left to their own volition, will only permit a certain few plumbers, in whom they feel confidence, to bid on their work. This is perfectly natural, and, while it gives rise to the charge of favoritism, should not be entirely condemned. An architect of the better class can be trusted in his selection of workmen to figure on jobs, while a shyster architect would prefer a skin-plumber any way.

When the work is figured on, and the contract is awarded, the plumber should be careful in his suggestions of changes in the plans. There are some architects who will listen to suggestions of that kind, and if they are valuable, and do not increase the cost, might adopt them. But in the majority of cases, the architect having designed the plumbing-fixtures as they are drawn, any suggested change from the plans will be looked upon with suspicion. Hence, the plumber having bid on the specifications as they existed, it is better for him to follow the specifications to the letter.

The architect usually notifies the plumber when the building is ready for roughing in. There is not so much work to be done behind the plastered walls nowadays as formerly, owing to the desire to have all pipes, so far as possible, in a position where they may be examined easily. The few iron waste and ventilation-pipes, which run between partitions, must all be put in before lathing is completed.

In doing the gas-piping, if it is provided for in the same contract with the plumbing, there should be much care. Cheap gas-fitting is an abomination. In rooms arranged en suite, with a center light in the ceiling of each, the gas-fitter should never notch the beams in the middle, and endeavor to run one straight line of pipe over all the centers. Beams should never be notched more than two feet from the bearing, and the center lights should be supplied by branches run from a pipe so placed.

Gas-pipes should be so laid as to give a continuous fall toward the meter, otherwise, the condensations from the gas will choke the pipe. The gas-fitter should take great care to place center lights exactly where designed, if not, when the ceiling is decorated, it will be very annoying to the owner to find the light out of center. The height of bracket-light outlets should be four feet and ten inches from the under floor, and this height should not be changed to save cutting the pipe. In halls, and in first-story rooms, the height is usually five feet and seven inches. Mirror lights should have outlets eight feet from the floor.

When the outlets are placed at proper height, care should be taken that the nipples are of correct length, and that they will permit the bracket-fixture, when placed, to bear at right angles to the wall. In order to secure this accurately, a pipe of sufficient length may be screwed on each nipple, as soon as set, and carefully made level and plumb, by testing with a carpenter's square. All deviations found should be corrected, before testing by a mercury gauge, so that any leaks caused by such correction will be discovered. Bends, tees, etc., for gas-pipe under two inches in diameter, are made of malleable iron, and it is wise to use these as they will stand a little bending, and that is often the easiest way to bring pipes into place. The nipples projecting from the pipe to receive the fixture, should be the proper length, so as to extend beyond the plastered wall not more than one and one-fourth inches, nor less than three-fourths of an inch. The gas-fitter commonly uses miscellaneous scrap-pipe for nipples, but he should endeavor to make them the proper length.

These are points in which all architects are, or ought to be, educated, and will be the foundation for criticising the man who has the contract if they are improperly done.

The architect, or his superintendent, after the whole gas-fitting service is in place, will probably examine the entire system to see that the irresponsible journeyman has not used split or defective pipe, closed with putty or red lead. It would be well for the master plumber to do this himself. The caps are then screwed on, and the tightness of the work tested by a mercury gauge. A manometer is placed at one outlet, and air is pumped into the pipes until the pressure in the system approximates the pressure of the gas supply. The mercury should remain at one height in the gauge over one night. If it does that, the work may be relied upon. If the gas-fitter does this work himself, very well; if not, the architect will probably require him to do it.

After the plastering is completed, the architect should notify the plumber that he may go on with his work. He should inquire as to the use of all stock which the plumber may bring to the building. The cast-iron pipe for the soil-pipe should be especially examined, and it should conform to the specifications as to weight. Manufactures have been covering pipe with a coating of asphaltum, and it is now generally used, but some believe that the asphaltum simply fills up sand holes and renders it difficult to detect doubtful pipe. Each length of pipe should be examined thoroughly for defects, thickness, strength of hub, etc., and all doubtful pieces promptly rejected. If possible, each length should be subjected to the oil-test, previously described in the *Sanitary News*. The requirements for joints in soil-pipe are so few and simple that only the most careful architects will permit any joint other than the oakum and calked lead to be made. The plumber, himself, should be especially cautious concerning the making of soil-pipe joints, because they, more than any other part, are indexes to the general character of the work. The architect will never allow the plumber to secure iron pipe by wires, but will insist on iron straps and hooks. No joints should be made before the pipe occupies the position in which it is to remain.

The architect will be especially careful concerning the weight and size of lead pipe used. When the end of the coil is cut off, the act of sawing increases the apparent thickness of the pipe, and it is difficult to judge of the weight and thickness of it. It is not generally considered safe to use pipe (except for a very light pressure), of a less thickness than three-sixteenths of an inch. Waste and vent pipes may be one-eighth of an inch. The plumber should refrain from using honey-combed or corroded pipe, and that which is of unequal thickness.

When brass tubing is used, the cold water supply-pipes should be tin-lined. Sometimes it is wise to use plain brass pipe for the hot-water supply, and lead for the cold, as the brass pipe is not so injuriously affected by changes in temperature as is lead pipe. Brass pipe should not be confined rigidly in long lines, as it will soon break the joints if it is. It is customary to put a coat of shellac on exposed brass plumbing work, and often the plumber will leave that for the painter, who will refuse to do it.

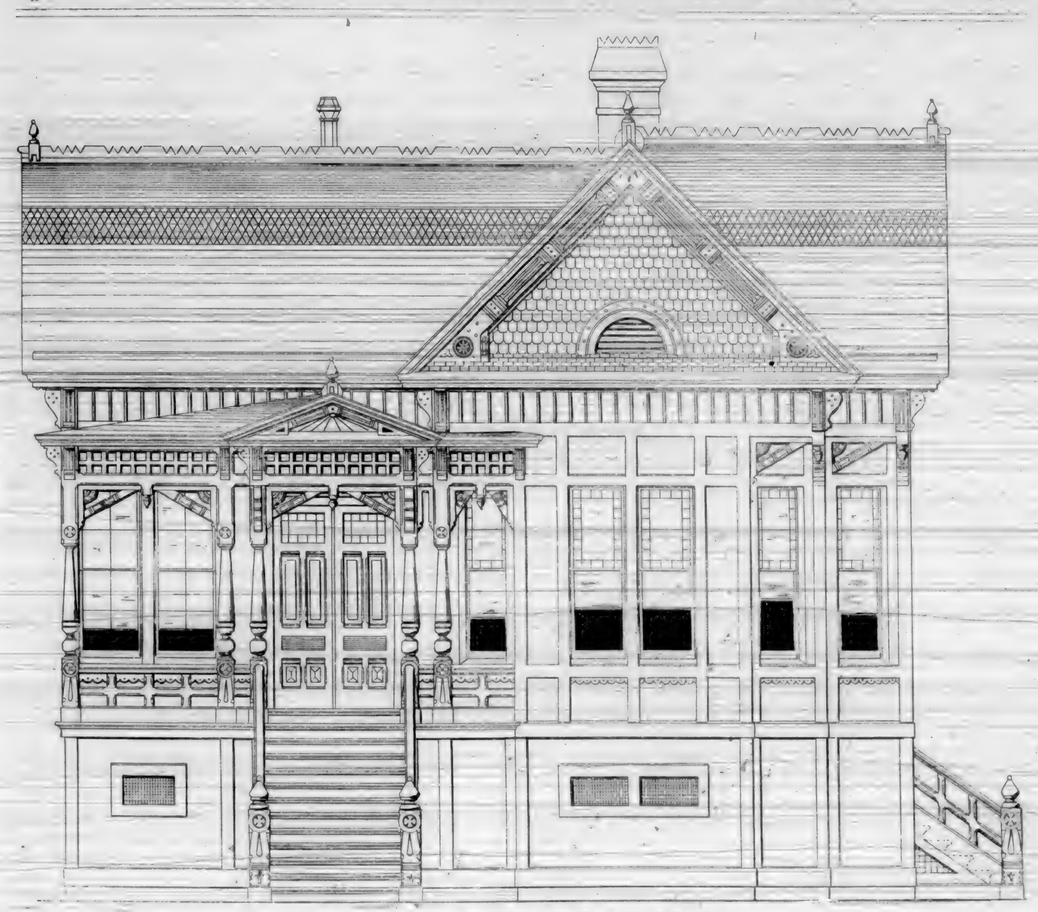
If a superior piece of work is done, and zinc casings are required to carry off condensations, leaks, etc., the architect will see that the casings are well-made, correctly applied, and have a proper fall to a safe outlet.

The course which the pipes take very often proclaims the skillful mechanic. If the several pipes used to connect up a bath-room, for instance, go coursing under and over each other in hopeless confusion, the man who arranged them so may be set down as a botch. A good workman will follow straight lines, so far as possible, and will separate the hot-water pipe from the cold-water pipe far enough so that heat will not be lost from one to the other. The house service pipe should not lead so close to the furnace or range as to warm the water when standing. All pipes will be laid with a continuous fall toward some faucet by which all the water may be drained off.

It is generally the duty of the carpenter to place boards against walls or ceiling where pipes are to run. The plumber should see that these are adequately fastened. When pipes are attached to these boards vertically, they should be fastened every four feet; when on the underside of a ceiling, about once in two feet, and, when lying on a horizontal surface, about once in eight feet. Metal tacks prevent vertical pipes from creeping downward by contraction and expansion. Brass bands are used by good plumbers to secure horizontal runs of pipe. Architects judge of the general character of a man's work by his attention to details, sometimes rightly concluding that if the slightest portions of the work are performed neatly, the more important parts are not neglected.

It is frequently true, too frequently indeed, that the specifications for the plumbing are not at all distinct or definite. In such cases, it must be understood that the plumber will do the work as cheaply as he can. The superintendent, or architect, will know just how good work he may expect, gauging the work by the compensation. In such cases, it is manifestly better to have a smaller amount of work and that well done, than to have the work scamped, and spread over all the house. By an attention to detail, and by avoiding captious authority, the architect may save the plumber money and reputation for careful work.

Whether a plumber should follow out a specification he knows to be bad or unnecessary, will depend on his acquaintance with the architect. At any rate, all questions of difference should be settled without bringing in the owner, who would know nothing as to the propriety of the work, and judge by prejudice simply.—*The Sanitary News.*



FRONT ELEVATION OF SUBURBAN COTTAGE.—PLATE 1.

Ambergris is a valuable and costly adjunct of the perfumer's art. It is believed to be caused by a disease of the liver in the spermaceti whale, in the intestines of which it is chiefly found, although it is cast up by the sea in Oriental climes, and is gathered along the shores of Coromandel, Madagascar, and Japan. It is an aromatic, gray substance, and as much as 150 pounds of it have been taken from one whale. A lump of ambergris of that size is worth to the whaler about $3,000. It is worth about as much as $15 an ounce in New York It is of incalculable benefit to the perfumer, as it gives homogeneity to the fragrance of combined extracts and oils in a remarkable manner, and strongly develops the delicate and evanescent odors of volatile oils.

Among the city ordinances which seem to meet with very little observance, is that relating to unnecessary obstructions of the sidewalk, where buildings are being erected or altered. The respectable contractors are not to blame in the matter, still less so are the subcontractors. In making bids every effort is, of course, made to get the figures down to the lowest notch, and as the unscrupulous man, he who is always ready to evade the law, or, at least, to observe it as little as possible, knows how little regard he needs pay to the class of ordinances referred to, he makes his calculations without any reference to the expense of complying with them, and thus gains a great advantage over his more scrupulous brother. Were it once fully understood that the law in this matter would be energetically and impartially enforced as to all alike, this element of cost would appear in all calculations: the just and the unjust would be put on the same level, and the public convenience would not suffer as it does now.—*Building Trade Journal.*

The Temple of Baalbec.

REV. HENRY M. FIELD, D. D., after his return from an extended tour through Eastern countries, has published a book on India and the Holy Land which is both instructive and entertaining. Doctor Field, in a letter to the *Evangelist*, of which he is the editor, thus describes the ruins that mark the place where the grandest of ancient cities is believed to have existed:—

The ruins of the ancient city of Baalbec, situated on the plain forty-three miles northwest of Damascus, are the wonder of modern architects.

Everything is colossal. The area is larger than that of the temple at Jerusalem. We may begin with the walls, which are half a mile around, and of such height and depth as are rarely attained in the most tremendous fortress. Where from within I climbed to the top, it made me giddy to look over the perilous edge to the depth below; and when from without the walls I looked up at them, they rose high in the air. Some of the stones seem as if they had been reared in place, not by Titans, but by the gods. There are nine stones 30 feet long and 10 feet thick, which are larger than the foundation stones of the temple at Jerusalem, dating from the time of Solomon, or any blocks in the Great Pyramid.

But even these are pygmies compared with the three giants of the western wall, 62 feet, 63½ feet, and 64 feet long. These are said to be the largest stones ever used in any construction. They weigh hundreds of tons, and instead of being merely hewn out of a quarry which might have been on the site, and left to lie where they were before, they have been lifted 19 feet from the ground, and there embedded in the wall. Never was there such cyclopean architecture. How such masses could have been moved is a problem with modern engineers.

Sir Charles Wilson, whom I met in Jerusalem, is at this moment in Baalbec. Standing in the grounds of the temple, he tells me that in the British Museum there is an ancient tablet which reveals the way such stones were moved. The mechanics were very simple; rollers were put under them, and they were drawn up inclined planes by sheer human muscle—the united strength of great numbers of men. In the rude design on the tablet the whole scene is pictured to the eye.

There are battalions of men, hundreds to a single roller, with the taskmasters standing over them, lash in hand, which was freely applied to make them pull together, and the king sitting on high to give the signal for this putting forth of human strength *en masse* as if an army were moving to battle. A battle it was in the waste of human life it caused. These temples of Baalbec must have been a whole generation in building, and have consumed the population of a province and the wealth of an empire.

The Walnut.

A WRITER in the *Garden* (London) wonders why this tree is comparatively but little planted, a singular fact when the beauty and value of its wood are taken into account. For gunstocks and much of our finer sorts of furniture, walnut timber is invaluable. Walnut trees, moreover, are free growing on almost all kinds of soil, and the crops of nuts which they produce would pay at least the rent of the land on which they grow, while freeholds might be purchased with trees of four score years of age. Walnuts in a landscape, also, are trees of mark, their magnificent heads of fine foliage in parks or paddocks rendering them especially adapted for such situations. They associate well with oak, beech, elm, sweet and horse chestnut, as well as with various other trees, and they do not rob the land more than their companions do. Their smooth, glossy leaves are washed clean by every shower, and the foliage is not so thick as to throw the rain off the grass or to keep air currents from circulating freely among the branches. There are, therefore, no trees either in park or pasture under which herbage grows better than it does under walnuts. Besides, walnuts come into leaf late, make their growth quickly, and lose their foliage nearly all at once after the first autumn frost. Thus a chance is given to take the leaves out of the way, so as not to injure the grass, while the shining dark young wood, with the grayish mature limbs, are left full in view. As to any tree that will grow more quickly into a size to be useful, I do not know where to look for it. I have seen old walnut trees that measured from 60 feet to 90 feet high; diameter of branches from 60 feet to 96 feet; and of bole or trunk from 3 feet to 5 feet diameter; and no doubt larger trees are elsewhere to be found.

"The American Architect."

FOR several years the *American Architect and Building News* has been published by the firm of Osgood & Co., of Boston. Business depressions have caused this firm to suspend. We are happy to announce, however, that the failure does not affect the publication of the above journal, and we are assured that its future prospects and growth will in no wise be retarded. To its friends on this coast, we can assure that it will be found at the proper time and will continue an uninterrupted publication. The editorial management continues in the hands of those who have so ably been the means of exalting it to the position of the leading Architectural Journal of America. We have received many favors at the hands of the managers, and publicly desire to express our appreciation of the same.

It isn't always the noisy, blustering, rushing foreman who gets the most work out of men or machines. His mind may be so taken by his ideas of "rushing business" that there is no time for cool calculation.

Errors Will Creep In.

OCCASIONAL complaints are made that our building intelligence reports contain errors. It would be a feat of extraordinary journalism, should we be able to complete each monthly statement, under the peculiar circumstances surrounding, without a single error. It is very often the case that the desired information is obtained by strategy, not willingly given by those in interest, and obstacles are interposed to prevent the obtainment of facts, for various reasons. Sometimes the architect is unapproachable, and will not "expose his business," thus leaving us to gain as best we may the information that might be correctly furnished at the simple cost of sacrificing a little individual self-importance and personal conceit, which can only inconvenience, but never prevent the obtainment of facts and figures. Sometimes contractors and owners misrepresent cases by hypothetical statements for purposes, and sometimes positive refusals to answer any questions are emphasized. When the fact is considered that the building reports for this journal involve interviews with from one to two hundred persons monthly, who are at liberty to make such statements and answers as they please, and the other fact that a *few* men are to be found who consider it a "good joke" to falsify and mislead, the greater wonder is that the reports are so nearly correct as they are, which, in the main, does not affect the grand totals, as over and under statements are perhaps about equal.

CREDITING THE WRONG ARCHITECT.

A complaint comes from San Jose that this was done in the May issue. If so, it was unintentional on our part, and an error in the report received from the capital city of the beautiful valley of Santa Clara. Naturally, information from places outside of San Francisco must come through correspondents, and we earnestly request that our kind friends use the greatest possible care to avoid error, particularly where two parties of the same name are practicing the profession in the same localities. As far as this journal is concerned, we repudiate the idea of possibility of an act of the kind being done intentionally.

THE ADDRESS OF OWNERS.

It has repeatedly been requested and urged that in connection with the months' report of building intelligence the *address* of owners should also be given. This would be a convenience to many for certain purposes, but it is sometimes with difficulty that the *names* alone are obtained, and in some cases are positively refused, and if the address were added, the difficulties in making up our reports would be greatly augmented, as owners generally prefer the least possible publicity being given to their private affairs. So that while we would be pleased to gratify every reasonable request of our patrons, it would be unwise to pursue a course for that purpose which would antagonize the feelings of many of our professional brethren and their clients.

SIDE ELEVATION OF SUBURBAN COTTAGE.—PLATE 2.

Brick in Ancient Rome.

THOUGH an ancient Roman boasted that he had found Rome brick and left it marble, the former has generally superseded both marble and all other kinds of stone, and even here in the heart of the iron industry complaint is made that owing to our sulphurous atmosphere it costs more to keep iron painted and free from oxidation than it is worth, and there are more brick than iron fronts in our heavy warehouses.

The Greeks, though celebrated for their work in marble, understood the value of brick, and did not allow them to be used until seasoned for five years, and their quality certified to by a magistrate.

The Romans were skilled in their manufacture, and the bricks in the baths of Titus and Caracalla have withstood the "tooth of time" better than the stones of the Coliseum. They introduced the manufacture into England, and left specimens of a deep red color well burnt, and at this date better than those made by English workmen in the reign of Elizabeth.

The Dutch made better bricks in the mediæval ages than the English, and specimens of Holland brick are still found in some of the old Dutch houses of New York.

In Asia the industry seems to have been followed to a time beyond, perhaps, the stone age, and the Chinese give the face of their brick the texture of porcelain.

The ancient Peruvians made bricks so well that a scientific Spaniard thought there must have been some secret in their composition, which had been lost prior to Spanish occupation.—*Brick and Tile Review.*

Chicago Crumbling Away.

CHICAGO'S public buildings, of whose magnificence its citizens have been so proud, and which it was thought would be "things of beauty and joys forever," are in a fair way to tumble out of sight in a hurry. To-day another one of the great cornices of the new Court House, which is barely finished, fell, knocking off half a dozen projecting ornaments on its way down and making a wreck at the sidewalk. This makes about twenty immense blocks of stone, weighing from 500 to 2,000 pounds, which have fallen off this huge edifice within two months. Each has barely missed crushing a number of citizens out of existence, and now that side of the street is avoided like a dead line. It is amusing to see a man or a couple start leisurely up that way, and then, suddenly remembering, glance at the building, and dash across the street as if life depended on it. Architects pronounce the whole of the imposing pile unsafe and declare it will be but a short time when it will all fall to pieces. The stone of which the building is constructed is of a very poor kind, and not at all suited to Chicago's alternate freezing and thawing. The post-office, too, is in the same condition. It has been condemned a dozen times as a most dangerous structure, and not more than a glance is needed at the great cracks an inch or more wide which traverse its broad sides hither and yon to believe any statement that may be made against it. As Mayor Harrison remarked, the Jail appears to be about the only building that can be relied on.—*Cleveland Leader.*

CONCERNING PICTURES.

A String of Paragraphs Gleaned from Various Sources.

PICTURES are undoubtedly among the most satisfactory of house attractions. They never wear or change in fashion. They are an ever-present pleasure, and to one accustomed to good ones, a home looks drear, indeed, without them. And "if things of beauty," we have the poet's authority for pronouncing them "joys forever."

The beauties of coloring in a well executed picture, the lights and shades, seem to be inherent to the sketch, for the same charm exists should the picture be a hundred years old, or only one.

Concerning the employment of pictures, let there be few, if only they are good, rather than many without excellence. Walls had better be bare than covered with worthless pictures. Some excellent work of young artists can be had for reasonable prices, if the work of men of great reputation cannot be afforded, and the purchase of such will encourage a very deserving and promising class.

The choice and position of pictures should be subjects of careful study. The former, perhaps, depends largely on one's means, but there are certain rules which must be applied to the latter in order to obtain the best effects. Care should be exercised in arranging a number of pictures having frames of different colors, to have them harmonize and look well. If there be taste or judgment, let it be exercised here; if money is spent to gratify a desire for something artistic and beautiful, be sure to get full value for it.

More attention should be paid to frames than is usually done. Frequently the intention of the artist is utterly defeated by an incongruous frame. A long chapter might be written upon this branch of the subject.

Pictures should be hung from a moulding extending along the wall directly under the ceiling; or, if there be a wide frieze, the moulding may serve as a separator between it and the dado, by means of hooks and wire picture cord, so that they will be on a level with the eyes of a person of ordinary height; but most houses do not have this moulding, and in a brick or plaster wall the driving of nails is a work of some difficulty. If you manage to hit the "studding," you are all right, except it happen that the "studding" is a foot or two out of the way—when you are all wrong.

Plain wood frames are the rule in the framing of small etchings. A very pretty frame for this purpose is made of polished white pine, with a bead line through it. All frames for etchings should be light in color.

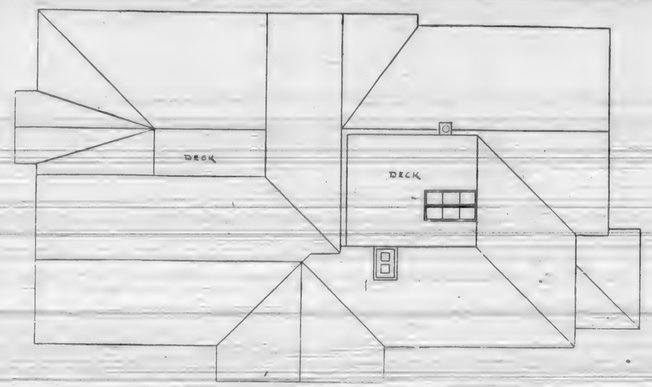
The largest photographs in the world are on exhibition at the New Orleans Exposition. They are views of the public buildings of Washington, taken by order of the Government, and are seven feet long and five feet wide.

Smoke pictures are a popular artistic fancy. They are made by smoking a piece of glazed card-board over a candle, wiping the half tones out of the sooty surface with a brush, which leaves a gray ground, and taking out the high lights with a pointed bit of wood.

In chromos America ranks first; the specimens we receive from Boston principally are conceded to be superior in finish to any in the world. In steel engravings American artists also do good work; but in pictures generally we have to rely on the Old World, for there are to be found the great masterpieces of which copies are sent all over the world.

When a person considers the numbers of pictures in an average dwelling, and the fact that new ones are being bought frequently and old ones retouched, the business will be seen to be of very great proportions.—*St. Louis Furniture Magazine.*

In France and Spain ordinary brick-dust made from hard-burned, finely pulverized bricks, and mixed with common lime, is universally used as a substitute for hydraulic cement. It is in some respects even superior to the best Rosendale hydraulic cement for culverts, drains, tanks or cisterns, and even for roofing purposes. It is regularly known in those countries as an article of commerce, and is sold in barrels by dealers at the same price as cement. A block of this substance one inch thick, without sand, after immersion in water for four months, bore, without crushing or splitting, a pressure of 1,500 pounds per square inch. The mixture of a small quantity of brick-dust to ordinary mortar will, it has been said, prevent disintegration.



ROOF PLAN OF SUBURBAN COTTAGE.—PLATE 3.

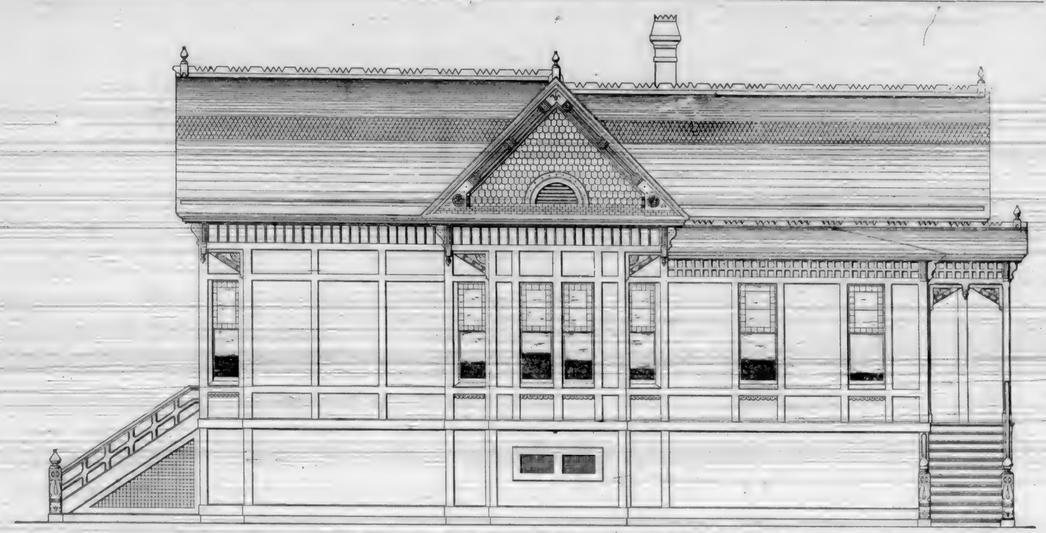
Buying a Lot from a Swindler—Need of Search of Titles.

AN unfortunate farmer named Hamberg, from Santa Clara County, last month, gave his small farm there, worth $2,500, and $1,000 in cash, for a lot 50x90 feet in size, on N. E. side Sixth Street, commencing 75 feet southeast of Bryant. At the price he was paying ($3,500) the lot would have been very cheap, as it is really worth $6,000. The buyer, with a verdancy that even Mr. Verdant Green would have been ashamed of, did not search the title to the Sixth Street property. After the transaction was closed and the Peter Funk deed went of record, Hamberg was rudely woke up by the true owner of the lot appearing. The latter was greatly scared, for he feared that the bogus deed would in some way deprive him of the title to his property. He was scared, while the defrauded farmer was full of indignation. The latter's own folly in not searching the title made the swindle possible. This transaction leads us to remark to buyers, that they should never, under *any* circumstances whatever, neglect to search the title, no matter who they are buying from, or how short a time previously the title had been searched. The title may be quite clear to-day and very much mixed to-morrow. The savings banks act upon that belief, for they never pay out a loan until they have first recorded the mortgage, and run the search down to the moment when the mortgage is recorded.

While the band saw has been steadily making its way into the mills that cut hard woods, the pine manufacturers have looked askance at it, doubtful if it could successfully compete with the log-devouring circular. However, some of the more progressive or more venturesome mill owners in the pine districts are giving the band mills a trial, and their efficiency will soon be settled. One of the latest to adopt the band saw is Radford Bros. & Co., of Ohkosh, Wis., who have just completed a double mill of the Hoffman make. This firm is best known as manufacturers of sash, doors, and blinds, but has always run a saw-mill in connection with its other business. The circular mill will continue to run, but the logs will be sorted, the better ones going to the band mill. A member of the firm, when asked if he did not feel a little anxious about the result of the experiment, said that he was perfectly confident of its success. They had thoroughly investigated the matter before placing the contract, and expected the mill to run straight ahead without trouble. He expected each saw to cut 25,000 feet a day, and their combined cut of 50,000 feet would be equal to that of a very respectable single circular mill. The mill was an expensive one to build, but he calculated that the saving over the circular, and the better grade of lumber turned out, would amount to $150 a day, when working in such logs as they would feed to it. This was allowing liberally for every contingency. The question of its success will soon be settled, and if this firm proves the efficiency, there will be others in eastern Wisconsin that will quickly profit by this experiment.

There is a science, after all, in so simple a matter as driving a nail. A correspondent writes that he recently witnessed the experiment of driving nails into timber that had been hard seasoned and well dried. The first nails, after passing through an ordinary board, went into the timber about an inch and then doubled up under the hammer. The tips of the rest of the nails were dipped into lard, and the driving was accomplished without any difficulty. The remedy is not a new one, but it is simple enough to be recommended for trial.

"There was a man once on a time who thought him wondrous wise; he swore by all the fabled gods he'd never advertise. But his goods were advertised ere long, and thereby hangs a tale; the 'ad' was set in nonpareil, and headed 'Sheriff's Sale.'"



SIDE ELEVATION OF SUBURBAN COTTAGE.—PLATE 4.

Plumbing Work.

TO OBTAIN and secure system of drainage and plumbing in a building, to secure to a house immunity at all times from sewer gas, and to prevent any subsequent annoyances incident to bad arrangement and careless workmanship in water pipes and plumbing appliances, it is necessary to observe the following points:—

First, to have the system of fixtures, supply and waste pipes well planned and arranged in accordance with the best rules; next, to have the work itself constructed in a thoroughly able and efficient manner by competent mechanics and under proper superintendence; and finally, after the work is all completed and put to use, to have it managed with intelligence, properly taken care of, and examined from time to time as to its continued soundness and freedom from defects. Hence, the subject naturally divides itself into the following sections, viz.:—

A. Principles, governing the planning and location of plumbing work in dwellings.
B. Rules, regarding the proper construction of the work, in particular as to
   (1) Materials;
   (2) Workmanship;
   (3) General arrangement;
   (4) Tests and general condition.
C. Suggestions as to the management and proper care of plumbing apparatus.

It is well known that much of the success of a system of house drainage and plumbing, to say nothing of the convenient and compact grouping of fixtures and the thereby reduced cost of the work, depends upon a judicious planning and arrangement by the architect or persons designing the plans of the building.

The general requirements mentioned under B should form a part—the principal part—of every plumbing specification. In order to adapt such a general specification to any particular building or dwelling house under consideration, it would only be necessary to add to the general requirements a detailed enumeration of all plumbing fixtures, including tank, boiler, cisterns and taps of all kind required in the building; a detailed description of all special apparatus wanted, including fixtures, traps, etc.; and a minute description of the material and of the course of all hot and cold water supply pipes, soil drain, waste and vent pipes, with reference to floor plans and sections of the buildings, which must always accompany a plumbing specification, and must show clearly the proposed system of drainage and water supply.

The suggestions named under C refer especially to householders and servants. It has become a recognized fact that a properly constructed drainage of a house must be intelligently used, and needs constant care and attention on the part of the householder to keep it in good order. Especially is this true of the vast number of houses occupied only during a part of the year, such as summer residences, seaside and mountain cottages, etc. It also refers to city houses, many of which are closed and vacated during the hot summer months. How to leave plumbing work in such houses during winter and during summer, without incurring the risk of finding on return that the pipes and traps have been frozen and burst, or that the rooms, walls, carpets and furniture are saturated with sewer air, is a question to which a certain amount of attention might with advantage be paid by every householder.—*Wm. Paul Gerhard, in Plumbers' Trade Journal.*

The Nail of the Future.

IRON cut nails are fast going out of fashion. Steel cut nails are driving them out. Wire nails are coming into use with great rapidity, and the designing of machinery for making them is taxing the inventive ability of many good mechanics. It is the opinion of some who have carefully studied the mechanical and metallurgical progress, that steel wire nails are destined to come into common use in the near future. Old Bessemer rails will come upon the market in large quantities before many months have passed, because they are wearing out faster than was thought possible in the earlier days of steel tracks. Mr. Masters has shown that they can be melted in an ordinary cupola and moulded into good castings, but it is believed that they can be utilized with more profit by drawing them into wire. Old steel rails can be readily worked into wire of good quality, suitable for nails. A mill has been erected in Syracuse for making wire from old rails, but it has not yet gone into operation. How fast steel wire nails will come into use depends largely upon how fast old steel rails are thrown upon the market.

An exchange proposes that street railways that charge five-cent fares should sell twelve tickets for fifty cents, or twenty-five for a dollar, assuming that people would ride oftener and take shorter rides by reason of the reduction. This is undoubtedly true. A person will ride three times at five-cent fares, when he would only ride twice at six cents, the result being a gain of three cents to the road. There is also another gain in the length of the ride, the two six-cent rides probably covering a longer distance than the three five-cent rides. In such case the road is a double gainer.

House-Building vs. Home-Building.

TALKING a plan for a small house with a client a short time ago, I objected to its having no inside cellar-stairs, to which he responded, "Oh, well, that don't matter; it is only a cheap house to rent." I used to respect that man, but now I look upon him much as I would if he had said, "Oh, well, that don't matter; poor people have no rights." And that man is the type of a great many men who build houses to rent. It is no wonder that the people who have lived in these houses "built to rent" are becoming building-association members by the thousand, and putting by something every week in the hope of some day building homes of their own—houses *built to live in*, and not "to rent."

A badly-arranged house is a constant source of annoyance to those who live in it. Nor is this the worst that may come of a house being built without all possible regard to the wants of its inmates. Serious injury to the health, especially in the case of the wife and mother who does her own work, is liable to result from such carelessness or ignorance; as, for instance, my client's idea of having the only cellarway an out-of-door one. Suppose the good woman of the house, or any one she may have to assist her, in the midst of some heating kitchen-work, is obliged to go to the cellar for some necessary article; she must go out of the hot kitchen into the weather, no matter how cold or damp it may be, get what she requires from the cellar, and in case of it being something requiring both hands to carry, she must make another trip to shut the heavy cellar door. The consequences may be only a disagreeable cold, or they may be unto'd misery and even death, destroying the happiness of the family entirely.

My client said that he had never looked at it in that way, and wanted to have at least three pairs of inside cellar-stairs to make sure of avoiding such direful calamities as I had pictured. I restrained his enthusiasm, however, and we compromised on one interior and one exterior cellar entrance.

A lady was showing me through her new house a few weeks since, not merely the parlor and front part of the house, but the whole establishment—kitchen, pantry, and all; and she said, "Why, sir, you can't imagine how much less work housekeeping is here than in our old house; and my husband can tell you that I have grown ever so much better-natured than I used to be, and it is all owing to the charmingly convenient arrangement of our new house."

"Yes, indeed," said the husband; "the remnant of my auburn locks will last much longer here than if we had stayed in the other house."

"Yes, and so will my china," rejoined his wife; "for it was being broken at a terrific rate in that dark, narrow china-closet."

"Your kitchen is smaller than the old one," I observed.

"Yes, and it is a great improvement; just that many less steps to take and that much less room to keep clean. This kitchen is fourteen feet square, and I wouldn't wish it larger."

I think that most housekeepers will agree with the lady on this subject.

It is not the purpose of this paper to give an exhaustive treatise on home-building, but I think we may condense into a few lines some general advice to prospective nest-builders that will be more readily comprehended and advantageously acted upon, than a whole volume of confusing science by men who have forgotten how to build anything less than law-courts, admiralty buildings, etc.

The first step is for the husband and wife to spend an evening talking the subject over, and make up their minds what the reasonable requirements of the family will be. They must decide how many rooms they ought to have; and it will be well for them to form as much of an idea as they can of what they want their house to be. The next step should invariably be to go to an architect—not any architect who may happen to live around the corner, and possibly advertise "plans and specifications while you wait;" but a good architect, one whose work bespeaks him a reliable and competent man in his profession. Such a man will not charge you more than two and a half per cent. on the cost of your house for making complete drawings and specifications for a house that will be satisfactory to you when finished. In addition to preparing drawings and specifications, your architect will draw up contracts for the work, and attend to the "bidding" and the signing of the contracts by the successful bidders, in legal form. You may depend upon it that the two and a half per cent. paid to a good architect is as well and economically spent as if it went directly into lumber and shingles for the new house. No matter how plain your house is to be, have it drawn by an architect, and don't think that it is too small to bother a *good* architect with.

When you have had the first talk with the man you have chosen to help you make your house a home, and an understanding of the requirement of the case has been arrived at, let him make a sketch for you which will serve as a basis for a final discussion. Now it is time for the question, "How much will such a house built in a good and substantial manner cost?" This the architect should be able to answer with approximate accuracy. If the price is a little more than you feel that you can afford to put into your house, an investigation of the sketches will probably suggest several opportunities of cutting down its cost without materially interfering with its arrangement or convenience. Let such cutting come off such features of the house as partake most of the character of luxuries—things which you would like to have, but can get along comfortably without. If the cost of the sort of house you ought to have is so much beyond your means that such a reducing process as I have described will not bring it within an amount that you feel you can consistently spend, the wisest way is to pay the architect a fee for the sketches, and lay them away till Dame Economy has increased your hoard sufficiently to allow you to go to the architect again and have him make the drawings, etc., for a house which you will find a constant source of contentment and satisfaction. As a rule, this is much better than building a house that is within your means, but not adequate to your needs, or, still worse, encumbering yourself with a heavy debt. So much for home-building in general.

SANITARY SELF-RIGHTEOUSNESS.—This caption may seem a trifle ambiguous, but it properly characterizes the feeling many people have when they read and talk of the terrible unsanitary condition of their neighbor's premises. In small towns it takes the familiar form of a guarantee that "our water comes from the best well in town," or "our house is well ventilated," because there may be transoms over the sleeping-room doors. It is always present in the confidence people have that their house is not a house to cause sickness and death. It is a never-failing resource in times of epidemics. It results in exposure to contagious diseases because some member of the family had once been exposed and was not attacked, consequently the disease was not "catching," or there was some occult influence, probably hereditary and providential, which protected this particular family. What poor, superstitious, unreasoning, go-it-blind creatures the larger proportion of the world is composed of! The majority are not even ready to act on the belief that cause is, and must be, followed by effect. Sanitary self-righteousness interferes with the administration of health laws by the health officials. It invariably makes the persons troubled with it think that health officers are a meddling, officious set, prone to disturbing innocent people for purely vindictive reasons, with no sincere knowledge of sanitary matters, and no desire to learn. All such people cast a wet blanket on sanitary progress. Sanitary self-righteousness interferes with sanitary progress on the part of the public, which is always only too ready to believe ill of a reform or a reformer. The self-righteous sanitarians frown on all but their own methods of work, and with their followers form a serious drawback to the proud advance sanitation is making in this country. —*Sanitary News, Chicago.*

The lumber for 48,000 clothes pins costs $3.00 and the clothes pins are worth $386.50. Four kinds of saws, a revolving polishing cylinder of iron, and a kiln, are requisite for their manufacture, and the poor creature who makes them has only 50 per cent. profit when he sells them for one cent.

"Science of Carpentry Made Easy." A new lot of this justly celebrated work, just received, will be sent post-paid to any address upon receipt of five dollars.

FLOOR PLAN OF SUBURBAN COTTAGE.—PLATE 5.

A Theory of the Redwoods.

THEORIES and explanations in regard to the question, why redwood should only be indigenous to a limited portion of the Pacific Coast, have been promulgated and answered ever since redwood lumber became an article of general consumption. We have endeavored from time to time, in the columns of this journal, to present interesting facts in regard to the production, manufacture, and uses of redwood lumber. Mr. Belleisle, a gentleman connected with the Southern Pacific Railroad, has made a study of the question propounded above, and it is with pleasure that we give his opinions in regard to the apparently stinted manner which Providence seems to have blessed this world with trees of the redwood species.

"One of the matters over which I have pondered for many long years," said he, "is the cause of the difference between the trees in the three districts comprised within the redwood belt—Santa Cruz, Mendocino, and Humboldt. I have a theory of my own, which I think is both original and correct. You are aware, of course, that, so far as is generally accepted, the belt I have mentioned practically contains all the timber redwood of the State. Occasionally, however, are to be found a few scattering trees along the coast ranges. Upon the latter fact I base one portion of my theory. To carry it out, we must go back almost into the mystic dreamland of ages and ages ago. My firm belief is that in times primeval the whole of the Coast Range and the mountains, as far away down south as they stretch, were covered with gigantic redwoods and other forest trees, recalling Longfellow's opening lines in his poem of 'Hiawatha.' I believe that very ancient buildings, if they could be unearthed, would substantiate this. How they were destroyed, who but the Omniscient knows? Scarcely to any immense extent by man, unless the mortals who used them have passed away, leaving no greater trace behind them than the grand old trees themselves. If the trees died a natural death, beaten and buffeted by the over-warring elements, and finally succumbing to old age, gout in the roots, rheumatism in the branches, neuralgia in the heart, and a feeble brain, what marvelous

"CLIMATIC AND PHYSICAL CHANGES

"Must they not have witnessed, but caused. To their death or destruction—presuming this portion of my theory is correct—may we not attribute to a very marked degree many of our sterile plains, deserts, and barren mountains down south? Forests destroyed prevent the moisture and the fertile leaf-mold requisite for agriculture. The absence of traces of these trees—except occasionally, as I have said—may be attributed to the tender shoots being dried out and poisoned, as it were for lack of protecting cover. Gradually, too, the ground would become too arid for even the support of the roots and stumps, and they, in the course of ages, would disappear.

"Now, then, the next step will be to Monterey. You have seen those grand old cypresses between Monterey and Carmel Mission, festooned with their garlands of trailing moss; with their gnarled and contorted trunks golden green with lycopodiums and a thousand and one species of mosses; silvery gray with many hued lichens and other parasites, and with the poisonous mistletoe pendant from their branches—all sapping away the life-blood from these venerable and gloomy-hued patriarchs. They have lived for thousands upon thousands of years, but are now fighting a fearful battle for bare existence. They are like a brave warrior in the agonies of death, and praying only for a brief respite to settle his worldly affairs and make his peace with God. They are doomed—although they may exist for centuries—for the pitiless elements are waging an irresistible war against them. They appear to have a stronger vitality than the redwood, for they have outlasted them, as comparatively few are to be found here, while the other trees are of much younger and more rapid growth, and of a different character.

"Now we cross the bay to Santa Cruz, with out discussing what geological changes may have happened in the eras of the past. Here we find that, although still somewhat protected by the Monterey forest belt, the redwoods are getting

"READY FOR THEIR FINAL FIGHT

"With nature's forces. We leave man and his invasion into their domains out of the question. Do you see how closely the grain and fiber cling together, as if the tree shuddered and shivered, as a man does in a chilling, icy-cold wind, which contracts closer every nerve in his body? As with the man, so with the tree—both feel the advance of decay and death. Mendocino comes next, more vigorous in youth than Santa Cruz, and consequently slightly more open in fiber, but already beginning to feel the threatened attack. Last comes Humboldt, younger and lustier, and of more rapid growth, fostered by the greater moisture and better protective influences. Consequently the wood is softer and more readily worked for many purposes than the harder of the southern woods. Another portion of my theory, and resulting from what I have said, is that the redwoods have, as it were crept up from the south, slowly driven from there to a more congenial climate. As to the manner in which this grand army of evergreen leviathans marched into our State, this must be left to be discovered by wiser heads than ours, although the student of forestry can find many similar examples among forest trees. We must be thankful that we live in our age, when they are with us to enrich the grand resources of our State, and in our gratitude we should treat them as kindly as we can—utilize them, but not willfully and wastefully destroy them. Hitherto it has been the practice to waste the butts and stumps, and hundreds of serviceable logs are lying idly on the ground; but erelong it will be found that they will all become very valuable, and perchance the most valuable.

"BEFORE MANY YEARS HAVE PASSED

"Away there will be no more blasting, by dynamite, of roots to make a potato patch, for it will be found that half a dozen such roots are worth more than an acre of potatoes. No; Economy in redwood will soon necessarily be the order of the day. The demand for it in this State, to say nothing of the rapidly increasing demand for it outside, will enforce a careful use of it. We do not yet know to how many uses this invaluable wood can be put. There scarcely seems to be any restriction upon its availability and adaptability to modern demands. Each day brings forth some newly discovered merits. The latest, and perhaps, one of the most important discoveries is its use as an ornamental wood for paneling purposes. It takes a very high polish, or can be polished to any extent desired. It is most durable, and not liable to split or warp, and has a grain of most beautiful texture and beauty, of varying and innumerable design."

Durability of White Lead.

WHY is it that white lead does not wear as well as it used to? is a question that is frequently asked by painters and consumers. They also add: We used to be able to obtain an article that would wear for years, while now its durability is much less. The important reason for this is found in the difference between the methods of manufacture employed now and a few years ago. Formerly, white lead was corroded by immersing it in vinegar aciduated with acetic acid, which is only concentrated vinegar. The process required about eight weeks before the carbonate was ready for use. This process, however, was found too costly, and the production was too limited to supply the demands. Then, too, a process requiring so long a time would compel corroders to invest a large capital from which they could realize no returns for a long period. They could not afford to produce lead in this manner at a cost sufficiently low to meet the demand for a low-priced article. Accordingly their ingenuity was taxed to invent some method whereby the carbonate could be produced much quicker and at a much less price. Thus they adopted the present process whereby the lead is now corroded by means of a stronger acid in a month, or even in a few days. The result is that the pure article is much less durable when applied to buildings. Speed in the manufacture of some articles, it is true does not sacrifice quality, while in others the greater celerity in manufacture the less durable the products. Not only is this seen in the production of lead, but another branch of manufacture where it is especially noticeable is that of leather. Formerly it required fifteen months to thoroughly tan a hide. Now the process has been shortened and a month and a half at the longest witnesses the completion of the work. As in the case of white lead, the result is lack of durability, and people constantly complain that leather soon cracks out and lacks its original durability.—*P., in the Painter.*

Risen from the Bench.

NOT from the Judicial Bench only, but also from the Joiners' Bench, have arisen some of the noblest of men; thus proving that where the hard-toiling mechanic rightly and perseveringly applies his talents he may rise, not only to influence, but frequently to affluence.

Inigo Jones, the celebrated architect, who was patronized by the nobility and crowned heads, not only of England, but of other countries, commenced life as a common carpenter.

Braham, the celebrated engineer, who conferred so great a boon upon his country and the world by the invention of the "Hydraulic Press," was apprenticed as a carpenter.

Dr. John Hunter, who by the common consent of all his successors, is regarded as the greatest man who ever practiced surgery; he who left behind him one of the greatest monuments of skill of which Great Britain can boast—the Hunterian Museum—was the son of a Scotch farmer, and until nearly twenty years of age worked as a carpenter with Mr. Buchanan, of Glasgow. Though rough in his manners, and very deficient in his education, he rose by his indomitable perseverance to the highest pinnacle of fame.

Henry Peto, Esq., the original proprietor of the extensive square of buildings known as Furnival's Inn, in Holborn, London, started life as a carpenter.

John Harrison, born at Foulby, near Pontefract, the inventor of the "Compound Pendulum" and the "Time Keeper" for ascertaining the longitude (for which invaluable invention he received £20,000 from the Government), was the son of a working carpenter.

Opic, so well known as the late president of the Royal Academy, was the son of a carpenter.

Haydn, the celebrated composer, was the son of a wheelwright.

George Harvey, Fellow of the Royal Society, the celebrated mathematician and president of the Plymouth Athenæum, started life as a carpenter.

Sir John Hawkins, an eminent London magistrate, whose remains are interred in Westminster Abbey, was originally a carpenter.

Dr. Samuel Lee, the celebrated professor of Hebrew at the University of Cambridge, was, at the age of twelve, apprenticed as a carpenter. This eminent and accomplished scholar received his education in the Charity School of Longnor, near Shewsbury.

Thomas Cubitt, who designed and built Queen Victoria's residence, Osborne House, in the Isle of Wight, was once a working carpenter.

Tredgold, one of the ablest engineers of which England can boast, the author of the popular work on the Steam Engine, was apprenticed to a common carpenter in his native village of Braudon near Durham. For five years he worked as a journeyman carpenter in Scotland. His biographer says: "During his leisure hours he diligently studied chemistry, geology, and mathematics, which was the secret of his extraordinary success in after life."

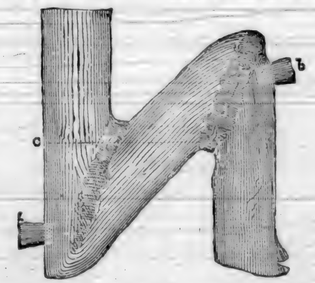
Sir S. M. Peto, Bart., was not ashamed to own that he once worked at the bench as a carpenter.

Alderman Cubitt, one of the greatest builders of the present age, worked at the bench as a carpenter.

These illustrations of eminent Englishmen who have started from the carpenters' bench might be largely increased by the examples of our own countrymen whose industry and perseverance have enabled them to overcome obstacles and to rise to distinction. Good use of leisure hours is a stepping-stone to success. —*Illustrated Christian Weekly.*

A Primitive Trap.

THE illustration given below is a correct representation of a hand-made trap which Mr. James Kelly, of this city, found in a public building at Paris, Texas. The plumbing of this building was recently overhauled by the Kelly Bros. and modern appliances substituted. The building had been supplied with water-closets, sinks, etc., and the usual amount of pipes, which discharged into a wooden, under-ground drain, which, in turn, emptied into a ravine, or other out-of-the-way place. The trap shown below was the only one in the entire building, and this was under a sink in a drug store on the first floor. It was made of straight pieces of lead pipe, clumsily soldered together at the joints, thus making sharp angles, and not curves. The dip at the left upper angle was not sufficient to reach the water line (shown at c), consequently it was of no use in



preventing the return of gasses. At a and b rubber corks were inserted in holes, the use for which was made necessary in removing solid substances which found their way into the trap from the drug store sink. This native specimen may be seen at this office. The job was probably done by a tinsmith or hardware dealer, and undoubtedly satisfied the demand for a "trap."—*Sanitary News.*

A good employer will make his controlling f ree felt without saying anything about it. To boast of power is to lose the greater part of it.

Velvet papers are among the most difficult material to handle which the paper-hanger is called upon to use. It is difficult at all times and sometimes impossible, to apply them to the walls without showing the seams. In some instances the paper, after being on for a while, will shrink and part at the seams, showing the white wall underneath through the opening thus made. In order to avoid such a result, the paper-hanger should see that the wall he is to cover is as smooth as possible. The paper should be trimmed with a knife and straight-edge. This method is necessary, because it is impossible to "butt" two edges of paper together properly which are not perfectly straight. A little dry color should be provided as near to the shade of the predominating color of the paper used as possible, and applied to the white edge of the paper after it has been trimmed, and before removing it from the paste-board. This will obscure the white edge, which is apt to show a little occasionally, even under the most skillful manipulation, on account of the edges not coming down to an exact level with each other. The position of the seams should be ascertained before any paper is put upon the wall, and a stripe about an inch wide made with the same color that is used on the edge of the paper, so that the seam will come in the center of it. If this color is carefully used in the places recommended, there will be no difficulty about white showing through the seams.

T. B. PETERSON & BROTHERS, Philadelphia have issued a new work entitled, "SNOB PAPERS," by Adair Welcker, Deputy Superintendent of Public Instruction, Sacramento, California. The scene is laid in San Francisco, Oakland, and the surrounding country, and the hero, a bluff old "Forty-Niner," has grown rich at the mines. He comes to San Francisco to mingle with the snobs and see life, and the shrewd sayings delivered in peculiar style, are of the most convulsing type, being one whirl of ludicrous adventures, which are quite exciting and sensational, while the action never ceases. Hosts of droll characters are introduced, among them several remarkably lively young ladies and some ladies of uncertain age who are untiring fishers in the matrimonial sea, while the local snobs and dudes are mercilessly ridiculed. "SNOB PAPERS" will be published in one large duodecimo volume of 500 pages, at the exceedingly low price of seventy-five cents a copy in paper cover, or $1.25 bound in morocco cloth, and copies will be sent to any one at once on receipt of price.

AN IMPORTANT INSURANCE DECISION.—Judge Holmes, of the Supreme Court of Massachusetts, rules that in case of fire "the insured is not bound to give a detailed statement of his loss; that the insurance companies must ascertain the amount as they can, and pay, or else they must stand suit. The plaintiff's right to sue is not dependent on having sent to the insurance companies a detailed statement of the loss which he has suffered."

The Embryo Architect.

THE profession of architecture is yearly increasing in public estimation, and the fallacy of the idea that the carpenter and the mason are the only parties required in building is becoming more clearly shown. We find that the appreciation of this art is in direct proportion to the increase in wealth, intelligence, and refinement, and many persons seem desirous of enabling their children to embark in the profession, which they consider one not only of good social status, but which has often proved to be one of emolument also. But the great mistake too often occurs of putting a boy into the profession who has no natural aptitude for such study. The first thing to be considered is whether or not a youth shows that predisposition which is an infallible sign of dormant aptitude. One who shows a natural fondness for the effort of delineating and originating things from his own meager resources, no matter how poor the first results may be—with a taste for reading and study, good practical sense, and no inclination to idle when he should be at work—needs only a good general education and the opportunity to become a first-class architect. After entering upon active duties, the architect has comparatively little time left for reading, and it is important that he be prepared beforehand with a good stock of literary information. The beginner, after having decided to enter upon architectural studies, will have to depend for future success almost entirely upon himself. The office of his principal will not be found to be a school such as he has been used to. All the architect can do is to allow his pupil a negative advantage—although it results as a positive one—in picking up bits of information from the daily business transacted in the office. The learner must keep his eyes and ears open, and not lapse into a listless state, expecting the information will be driven into him. He must improve his time in reading works connected with the history and practice of modern and mediæval architecture, never dodge a difficulty in executing a plan, and make comparisons of buildings of every kind with the drawings prepared for them. In short, he must rely upon his own resources. A teacher can hardly do more than to guide him to the right road and give his encouragement.

The great difficulty with American youth is the almost insane desire to arrive at desired results with but a single effort. The first short lesson in architecture should be that "Rome was not built in a day," and that it takes time to accomplish things. Many young men enter an architect's office with a vague notion that to design a fine building is only to make a few marks on drawing-paper, and that only a few months will be required to master the secret of just how to draw them. But the unexpected fact gradually dawns that architecture, after all, is something that people have to study, and very diligently, too. Many get discouraged at the maze of detail that is continually opening before them with no promise of end, and give up the study in despair, even after they have traveled a good portion of the road to ultimate success.—*Building Trade Journal.*

Architectural Journals.

AT the last session of the American Institute of Architects, O. P. Hatfield and Henry M. Congdon were appointed a special committee to report upon the Architectural Journals published in the United States.

The following report upon the CALIFORNIA ARCHITECT AND BUILDING NEWS was published in a pamphlet issued by the committee:

"In San Francisco, California, the 'California Architect and Building News' is a monthly publication, conducted with great energy and ability, and now issuing its fifth volume. Its illustrations of California buildings are liberally given, and it adds a series of portraits of the leading architects of the Pacific Coast. It reports the proceedings of the S. F. Chapter of the American Institute of Architects quite fully, and gives biographies of its prominent members."

The committee also adds that they "congratulate the Institute and the profession on the number of excellent serials that are now issued in this country in the interests of architecture and its kindred arts."

In concluding its report the committee earnestly draws the attention of every one connected with the profession to the following:—

"Every architect should feel it to be his duty to contribute promptly and steadily by literary work, drawings and subscriptions, to the support and maintenance of architectural serials."

Architects of the Pacific Slope.

IT should be your pride to say that you have furnished designs or written articles for publication in the CALIFORNIA ARCHITECT. We will be pleased to receive the same, and give full credit to contributing patrons. Drawings should be on card-board, line shaded, and extra care taken to use PERFECTLY BLACK INK. Any questions in regard to the above will be answered by addressing the editors, 240 Montgomery Street.

Old whitewashed walls are a difficult surface to make paper adhere to properly. In treating such a wall, the loose whitewash should be scraped off and a strong coat of glue size applied to the wall. After this has become dry, the paper may be put on. But this is not all. The paste used on the paper should also be specially prepared. Pure wheat-flour paste should be used, and to every pailful of it, thinned to the proper consistency, use about one pound of common sugar thoroughly mixed with the paste. Occasionally paper-hangers will have difficulty with this kind of work, but if they observe these hints, not forgetting the sugar, difficulties will be of rare occurrence.

MASONS' AND BUILDERS' EXCHANGE
OF SAN FRANCISCO
Room 11, 314 Montgomery St.

BELOW will be found a list of the members composing this Exchange. Boxes are provided for each member, so that architects, owners, or others desiring the services of any particular member, or those having boxes who are not members, and yet whose business is directly connected with that of the Exchange, can readily secure the attendance of the party sought, by leaving a note in the respective boxes.

BUILDING INTELLIGENCE.

By reason of oversight the following buildings were incorrectly credited last month. The credit belongs to Theo. Lenzen, Architect, San Jose.

San Jose.—S. E. corner Santa Clara and San Teresa. Two-story frame. O., M. Kenny; A., Theodore Lenzen; C., A. J. McIlvain; $4,700. Cinnabar, near Alameda. Frame stable. O., Fredricksburg Brewing Co.; A., Theodore Lenzen; C., M. D. Green; $1,700.

Willow, corner Laguna. Three two-story frames. O. and B.—J. Thompson. $11,000.

Gough, corner Ellis. Two-story frame. O.—W. Easton. A.—W. F. Smith. C.—J. Robertson. $10,000.

Golden Gate Ave., nr. Polk. Two two-story frames. O.—J. Robinson. A.—John Newsom. C.—J. McCann. $16,000.

Laguna, corner O'Farrell. Alterations. O. and B.—Jos. Gasling. Days' work. $2,500.

Ellis, nr. Van Ness Ave. Two-story frame. O.—S. W. Dick. A.—McDougal & Son. C.—A. Jackson. $6,500.

Union, cor. Pierce. One one-story frame. O.—H. Bartels. C.—F. Schibel. $2,500.

Greenwich, nr. Pierce. Two-story frame. O.—H. Klincks. C.—O. H. Walker. $1,800.

Pixley, bet. Fillmore and Steiner. One-story frame. O.—F. Heusell. C.—Cupp & Green. $2,500.

Union, cor. Gough. Two-story frame. O.—S. Tallman. C.—J. Taylor. $3,000.

McAllister, northeast cor. Laguna. Three-story frame and alterations. O.—Julius Schulken. A.—Schmidt & Havens. C.—Jas. A. Hayden. $10,000.

Howard, east side, bet. Twentieth and Twenty-first. Two-story frame. O.—J. F. English. A.—Schmidt & Havens. C.—F. W. Kern. $2,500.

Clay, southeast corner Hyde. Two-story frame. O.—Jas. Musto. A.—Schmidt & Havens. $15,000.

Oak, near Steiner. Two-story frame. O.—J. H. Humphrey. Days' work. $3,000.

Page, near Devisadero. Two-story frame. O. and B.—H. L. Plummer. $3,500.

McAllister, near Pierce. Four two-story frames. A.—Schmidt & Havens.

Fillmore, nr. McAllister. Two one-story frames. O.—Mrs. L. Albrecht. A.—J. C. Pelton. C.—F. W. Kern. $4,500.

Fillmore, bet. Bush and Sutter. Additions. O.—M. Herman. A.—S. & J. C. Newsom. C.—D. B. Spangler. $1,000.

Channel, nr. Byrant Ave. One-story frame. O.—L. Davis. C.—G. A. Stevens. $2,000.

M., bet. Eleventh and Twelfth Ave. Five one-story frames. O. and B.—J. Hanlon. $5,000.

Harrison, near Twenty-fourth. Alterations. O.—P. Dumont. C.—J. Lagrange. $700.

Treat Ave, nr. Twentieth. Alterations. O.—Dr. Cowen. A.—J. Marquis. C.—W. M. Kincaid. $1,000.

Columbia, bet. Twenty-fourth and Twenty-fifth. Two-story frame. O.—L. Hackett. A.—M. J. Welch. C.—L. F. Hubley. $2,500.

Twelfth, nr. Folsom. Repairs. O.—Stevens. C.—T. Moffat. $4,000.

Nebraska, nr. Nevada. Additions. O. and B.—G. Dillman. $800.

Nebraska, nr. Humboldt. One-story frame. O. and B.—C. Hanson. $2,000.

Market, corner Fell. Two-story frame. O.—Mrs. J. Driscoll. A.—H. D. Mitchell. C.—James Geary. $12,000.

Washington Ave., nr. Mission. Two-story frame. O.—W. Celner. A.—A. C. Lutgens. C.—H. Thom Worden. $3,000.

Willow, nr. Valencia. Alterations. O. and B.—P. Inaud. $1,000.

Baker, nr. Pine. Two one-story frames. O.—E. Rienhold and F. Schultz. A.—H. Gielfuss. C.—Wm. Pluns. $4,000.

Elgin Park, cor. Ridley. Two-story frame. O.—Mrs. M. Murphy. A.—J. C. Pelton. C.—J. McCann. $3,500.

Fell, nr. Market. Two-story frame. O.—Mrs. J. Driscoll. A.—H. D. Mitchell. C.—Jas. Geary. $8,000.

Bush, nr. Buchanan. Two-story frame. O.—I Frank. C.—H. Meyn. $4,500.

Grove, nr. Broderick. One-story frame. O. and B.—R. Lund. $1,000.

Golden Gate Ave., nr. Fillmore. One-story frame. O.—H. Worth. A.—McDougal & Son. C.—D. F. McGraw. $3,500.

Golden Gate Ave. Two-story frame. O. and B.—S. Harris. A.—C. Day. C.—J. B. Gouyeau. $5,000.

Seventeenth, bet. Noe and Sanchez. Additions. O.—O. D. Baldwin. Days' work. $1,500.

Ford, nr. Noe. One-story frame. O. and B.—T. Darcy. $1,600.

Castro, bet. Seventeenth and Eighteenth. Two-story frame. O.—L. Koford. Days' work. $2,700.

Bush, nr. Buchanan. Five two-story frames. O.—C. H. Stanyan. C.—J. Drury. $17,000.

Pierce, bet. Sutter and Post. One-story frame. O.—C. D. Salfield. A.—Salfield & John. C.—F. W. Kern. $4,000.

Sutter, bet. Baker and Lyon. Two-story frame. O.—F. Marks. C.—F. Wienell. $3,000.

Dehon, bet. Sixteenth and Seventeenth. One-story frame. O.—H. H. Murphy. C.—J. A. Dyer. $2,000.

Sanchez, nr. Seventeenth. One-story frame. O.—C. P. Williams. C.—I. P. Kincaid. $500.

Ford, nr. Sanchez. One-story frame. O. and B.—E. Mandonnet. $1,000.

Sanchez, nr. Nineteenth. Two-story frame. O. and B.—S. Foster. $3,000.

Seventeenth, nr. Mission. Additions. O.—Capt. H. G. Burns. C.—C. E. Dunshee. $2,000.

Ford, nr. Sanchez. One-story frame. O.—H. J. Carah. A.—J. J. Clark. Days' work. $1,500.

Harrison, near Twenty-Third. Two-story frame. O.—J. Hogan. A.—M. J. Welch. C.—Bigelow & Son. $1,400.

Harrison, bet. Eighteenth and Nineteenth. Repairs. O.—P. Gannon. A.—M. J. Welch. C.—McCormack & Elam. $1,600.

Market, bet. Ninth and Tenth. Three-story frame. O.—Geo. D. Nagle. A.—John J. & T. D. Newsome. Days' work. $15,000.

Sacramento, bet. Franklin and Van Ness Ave. Three two-story frames. O.—R. Gonzales. A.—J. Marquis. C.—L. Wagner. $15,000.

Post, bet. Leavenworth and Hyde. Additions. O.—Chas. Gibbs. A.—J. Marquis. C.—L. Wagner. $4,000.

Market, cor. Sixteenth. One-story frame. O.—Trinity M. E. Church. A.—J. Gash. Days' work. 2,000.

Haight, bet. Octavia and Laguna. Two-story frame. O.—L. C. Lefavar. A.—John J. & T. D. Newsome. C.—A. H. Plummer. $4,500.

South Park, cor. Center Place. Two-story frame. O.—S. B. Vreeland. A.—Percy & Hamilton. C.—Grey & Stover. $4,500.

Hayes, nr. Gough. Six two-story frames. O.—Mrs. Kasts. A.—Salfield & John. C.—H. Meyn. $14,000.

Fourth, cor. Harrison. Alterations. O.—F. E. Hessedaal. A.—Geo. E. Voelkel. C.—G. Knopfe. $500.

Bush, nr. Hyde. Three-story frame. O.—Mrs. A. Paturel. A.—Geo. E. Voelkel. C.—G. Knopfe. $5,000.

Market, cor. Golden Gate Ave. Additions. O.—W. E. Dean. A.—E. R. Swain. C.—Geo. Richardson. $30,000.

Bryant, nr. Third. Two-story frame. O.—J. Monyhan. A.—John J. Clark. $3,000.

Fillmore, cor. Oak. Two-story frame. O.—F. T. McCauliffe. A.—John J. Clark. C.—John Adams. $6,000.

Baker, bet. Sutter and Bush. Two-story frame. O.—D. J. Sullivan. A.—T. J. Welch. C.—S. D. Mathews. $2,000.

Turk, south side, nr. Franklin. Two-story frame. O.—John J. Vollmee. A.—S. & J. C. Newsom. C.—W. Tryon. $5,000.

Union, south side, near Mason. Two-story frame. O.—P. Barbeiri. A.—S. & J. C. Newsom. C.—C. W. Tryon. $5,000.

Octavia, west side, near Green. Two-story frame. O.—C. Lacy. A.—S. & J. C. Newsom. C.—R. W. Murry. $4,000.

Harrison, bet. Third and Fourth. Two two-story frames. O.—F. E. Hessedaal. A.—Geo. E. Voelkel. C.—G. Knopfe. $4,500.

Fourth, nr. Harrison. Two two-story frames. O.—F. E. Hessedaal. A.—Geo. E. Voelkel. C.—G. Knopfe. $5,000.

Van Ness Ave., cor. Fulton. Five two-story frames. O.—C. G. Hooker. A.—Percy & Hamilton. C.—Grey & Stover. $28,000.

Bush, bet. Octavia and Laguna. Two-story frame. O.—J. F. Eklund. A.—T. J. Welch. C.—S. T. Green. $6,000.

Kipling, bet. Eleventh and Twelfth. Two-story frame. O.—J. E. Tosney. A.—T. J. Welch. C.—J. W. Smith. $2,500.

Fourth, bet. Folsom and Harrison. One-story frame. O.—C. Maginnis. A.—T. J. Welch. C.—F. Bohnenberg. $1,400.

Polk, nr. Jackson. Alterations. O.—M. H. Gallnoy. A.—T. J. Welch. C.—Bateman Bros. $2,000.

Bath, nr. Kentucky. Alterations. O.—H. Day. A.—T. J. Welch. C.—T. Conners. $510.

Leavenworth, bet. Turk and Tyler. Three-story frame. O.—L. Koehelin. A.—Salfield & John. C.—Müster & Ames. $7,500.

Greenwich, southeast cor. Pierce. Four one-story frames. O.—Aug. Harenberg. A.—B. E. Henricksen. C.—G. Walker. $5,200.

Bush, bet. Stockton and Powell. Four-story frame. O.—J. Ritch. A.—Townsend & Wyneken. C.—Wm. McFletcher. $20,000.

Valencia, bet. Twenty-third and Twenty-fourth. Seven one-story frames. C.—Mrs. S. Dredge. A.—Townsend & Wyneken. $7,000.

Bartlett, bet. Twenty-first and Twenty-second. One-story frame. A.—W. G. Copeland. C.—Geo. McRae. $2,400.

Seventeenth, nr. Mission. Alterations. O.—Col. Burns. A.—H. D. Mitchell. C.—D. B. Spangler. $1,500.

Howard, bet. First and Second. Alterations. O.—M. Becker. A.—B. E. Henricksen. C.—Y. Hanavan. $1,500.

Park Ave., opp. City Hall. One-story brick. O.—F. Happenberger. A.—F. H. Hillert. Days' work. $2,000.

Fair Oaks, cor. Eighteenth. Two-story frame. O.—M. T. W. Lewis. A.—Townsend & Wyneken. C.—Littlefield & Chapman. $4,500.

Larkin, northeast cor. Olive Ave. Three two-story frames. O.—Chris. Hacke. A.—H. Gielfuss. C.—Wm. Pluns. $9,000.

Ellis, nr. Powell. Three-story frame. O.—Wm. E. Turner. A.—H. D. Mitchell. C.—R. McCann. $12,000.

Bush, nr. Steiner. Three-story brick. O.—Dominican Fathers. A.—T. J. Welch. Masons.—McGowan & Butler. Carpenters.—Mahoney Bros. $70,000.

One-story frame. O., Wm. Caward; C., W. Hunt; $1 500. First. Two-story frame improvement. O., Wm. Caward; C., W. Gammell; $1,250. One-story frame. O., Peter Lawson; C., J. Amesbury; $1,6 0. Cross Ave. One-story frame. O. and B., W. Hoyden; $1,000. Two-story frame improvement. O., Benj. Peart; C., W. H. Winne; $1,650. Two-story frame. O., Mrs. B. Miller; A., Victor Hoffman; C., William Towlson; $3,500. Elm. One-story frame. O., Mrs. Ward; A., J. Caldwell; C., Amesbury & Davis; $1,500. One-story frame. O. and B., John Ruport; $1,000 One-story frame. O., C. B. Church; C., A. Lake, $1,200. College Ave. Two-story frame improvement. O., J. P. Grafton; C., G. W. Myrick; $1,000 Two-story frame. O., Emma H. Briggs; days' work; $2,500. Elm. One-story frame. O., G. W. Evans; C., John Mitten; $1,800. Sixth, cor. Court. One-story frame; O., J. J. Hannan; A., A. J. Newson; $2,000. Main. Pacific Hotel. O., Chris. Seiber. Improvements. C., Amesbury & Davis; $1,050. Two-story frame. O., George Pierce; C., W. H. Winne; $5,000.

Black Station—Two-story frame. O., Fred. Henrich; C., George Cornkike; $2,100.

Orleans Hill—Two-story brick winery. O., Arpad Haraszthy & Co.; C., Mr. Mullanny; $12,000.

Santa Clara—Near town. Two-story frame. O., J. B. J. Postal; A., J. O. McKae; C., R. Summery; $6,575.

Los Gatos—Cottage. O., B. L. Bartlett; A., J. O. McKee; C., F. Lobdell; $2,460.

MISCELLANEOUS.

East Berkeley—One-story frame. O., G. Wilson; A., M. J. Welch; C., J. Spencer; $1,000.

Napa City—One-story frame. O., M. Preece; A., J. Marquis; C., J. Stevens; $3,500. Two-story frame. O., Chas. Knapp A., J. Marquis; days' work; $3,000

Martinez—Contra Costa County. Three-story frame. O., B. Fernandez; A., B. J. Clinch; C., Bulger Bros.; $14,000.

EASTLAKE,

A Superior Mixed Paint,

Especially adapted to the climate of California.

Glossy, Durable, Easy Working, Economical.

No turpentine, benzine, gum or rubber. Works as easy as if mixed with turpentine! Workmen speak well of it. In use in San Jose for three years.

Sun and Fog do not Destroy its Gloss, or Cause it to Chalk.

Manufactured by the **EASTLAKE PAINT CO.**, 199 South First St., San Jose, Cal. J. C. Ellis, Agent, San Francisco.

Country Mechanics furnished with THE BEST OF TOOLS AT LOWEST PRICES

Address, CAL. ARCHITECT.

BLUM, EPPSTEIN & MARSH.

MANUFACTURERS OF

Inlaid Wood Flooring

WOODEN MANTELS,

Hard Wood Interiors.

Office and Parlors 126 Kearny St., 2nd Floor,

Present, Past, and Future.

Of the past we have written, as month by month its facts have revealed and developed themselves and furnished material for notice or comment. The record up to the present time has been exceedingly brilliant, as far as the extent of building improvements are concerned, and the expenditures made in the erection of structures for business, resident, and tenement purposes. While hundreds of acres of building lots have been utilized for the erection of either homesteads ranging from moderate cost to almost palatial residences, and houses and flats of greater or less cost and pretention, very many splendid and costly structures designed for commercial and general business, or special purposes, have been erected,—all of which has been a subject-matter of surprise and comment; for while this great prosperity has been enjoyed to the great delight and profit of those who have furnished and sold, and those who have handled and worked up the large amount of materials required for the purposes, there has been a continuous complaining among all classes of producers and trades people, from the "heavy operators," down to the tape and needle vendor, that "times are dull." Still—without entering into the why and wherefore—the building interests have maintained great activity, as has been shown by the monthly reports appearing in this Journal, and especially by the semi-annual report given in the June number.

But how about the future? Can this state of things be continued, and, if so, for how long a time? That there has been more buildings erected than seemed to be necessary to supply demand for rented houses, is plainly evident from the large number of "to let" signs exposed on the fronts of buildings, new and old. And the question arises, whether it is reasonable to anticipate a continuance of improvements, equal to that which has been during the past three years? If it is, and future facts demonstrate such anticipations to have been well founded, then indeed is there a most grand future in store for the metropolis of the Pacific Coast. This one material fact, however, still exists, that a great many who have not as yet done so, are seeking for building lots in desirable localities, with the intention of improving the same with comfortable residences, varying from $7,000 to $20,000.

A Russian traveler predicts that Thibet will prove to be a second California, as during a recent visit there, he found the natives gold-washing in the crudest way, but with the richest results.

Building Report for July, 1885.

The returns, from all sources, of building engagements, for the month ending with present issue of this Journal, shows that, as compared with the June report, there has been a decline in activities, aggregating as follows:—

June, 1885, 148 building engagements, amounting to $588,410
July, 1885, 99 building engagements, amounting to 412,050
July less than June $176,360

The July report in 1884 was eighty-seven engagements, of the value of $663,909, showing that, while July of present year returns ninety-nine building engagements, as against eighty-seven in 1884, the expenditures are $251,859 less. While the foregoing facts indicate a breathing spell in building circles, it is confined to the speculative operators—those who rush up buildings to sell, glutting the market with a certain class of *cheaply* constructed houses, which are sold as "first-class"—the *first-class* being a taking term with those incapable of judging quality beyond the general, outward appearances of things, and others who have improved their lots because "lumber is cheap," until the great rush that has been going on has more than provided for all reasonable necessities, and furnished a supply greater than the demand. But with a temporary suspension in the "boom in building" that has been going on during the past three years and longer, there is no indication of a decline in the more-to-be-desired class of buildings, *i. e.*, private residences costing from $5,000 to $20,000. Good lots in desirable localities are being sought for by scores of business men, who, although among the number who have been crying "dull times," are prepared with the cash to buy lots and erect private residences for themselves and families. Altogether, matters in this connection still have a healthy appearance, and we do not fear any set-back greater than to cool down the ardor of the rushers who have driven matters just a little too far.

Dr. John H. Rauch, Secretary of the Illinois State Board of Health, says that returns of the house-to-house inspection and sanitary survey continue to be received by the Board, and a wonderful improvement is noticeable between the time of making the first inspection and the second. An examination of the tabular statement shows that an immense amount of cleaning up, abatement of nuisances, and general sanitary work is being done throughout the State, and should be continued while the favorable weather lasts.

Not "One-Sided Nor Prejudiced."

THE *Building Trade Journal* in its issue of June 15th, in quoting and noticing our article—"*Insolvent*"—in our May number, page 75, says: "Although there are incompetents in every trade and profession, the ratio given above, as applying to builders, indicates a rather *one-sided and prejudiced* view of the matter."

The sentence last above italicized, is, to us, severely objectionable, for it is not in us nor of us to be actuated or influenced by motives or feelings so ignoble and unworthy to common manhood, and much more so to one who occupies the chair editorial of a class journal. There was neither malice nor prejudice in the cases reported by us; neither of the parties were known to us personally, nor had we knowledge of their existence as men, until their financial status became matters of general information through the daily press and otherwise. Consequently, there is no shadow of grounds for our St. Louis contemporary presuming that personal feelings entered into the case.

And more than this, the facts of the Gilbert & Co. case were mildly stated, nor near one-half the story told, as has been clearly demonstrated by subsequent developments,—investigation showing that the concern was guilty of *absolute* recklessness, but little if any less in character than preconceived and preconcerted rascality; or, if not this, then executive incompetency and personal ignorance of values, and lack of ordinary good judgment and common-sense were largely in the ascendancy. Contract upon contract was undertaken by them at ruinous figures, and the loss upon one afforded no admonition of care in the next,—each successive and subsequent move augmenting their financial difficulties, until, overwhelmed by accumulated burdens, they were compelled to succumb, and terrible in its way was the fall thereof; as numerous confiding creditors and clients were made to suffer to the tune of nearly one hundred cents on the dollar, and the houses turned out by them were of the worst "skin" kind; thus adding mechanical to financial dishonesty. Yet our kind-hearted brother editor indulges the suspicion that we, with these facts before us, may have been "one-sided and prejudiced." This we presume to be prompted by his great natural innocence and kindness of heart, and his lack of experience in the "ways of the world," as found in the history of the building business in California.

It is no more pleasant to us than to him, to speak or write disparagingly of any one, and we are as ready and willing as any one to sympathize with misfortune, nor wish we ill even to our meanest enemy; for "vengeance is mine, saith the Lord," and far be it from us to seek to anticipate the divine will, by the interposition of personal prejudice or petty spite toward any one. But while most generously disposed, and ready to help our fellow-man, as journalists in the interests of architecture and building sciences, it becomes an incumbent duty to expose transactions and customs which bring discredit and reproach upon either, and financial disaster and loss to those who furnish the materials and labor accompanying such results.

Again, our good brother did not read us understandingly, or he would not have placed us in a false light in his columns. Our ratio did not apply to mechanics generally, but to that *special class* of "frauds" which have so largely abounded in California. We said: "There are not five in one hundred of *the — class* who are not frauds in more ways than one," and it is true. It may be that in St. Louis and other cities such cases are the exception, but on this coast they have been numerous; and the outcry among the good and competent of all classes of mechanics has been for a quarter of a century against the demoralizing and injurious effects of the class in question; who—however honest in intent and purposes, and however deserving of sympathy they may be, in business practices, are consummate asses and swindlers, taking work sometimes at but little better figures than the actual cost of materials, settling with creditors at all rates of percentages, from 10 cents on the dollar and upward; and as it has been in a large number of cases, where the owners have been compelled to finish up their buildings on account of contract, the balance of contract sum has proved insufficient to complete the work, leaving creditors no *pro rata* whatever.

We hope hereafter that contemporaries in the older States, before impugning our motives in the relation of cases occurring in California, that they inform themselves more perfectly as to the state of facts, and fix judgment upon those, rather than rejecting statements coming to them from authentic sources, simply because they seem extraordinary and improbable, viewed in the light of experiences in cities and States where such irregularities seldom if ever occur.

It is well and charitable to "*hope* that ambition and real enterprise have more to do with the desire to climb upward, than a combination of incompetency and egotism;" it is well to so *hope*, but such hopes rest upon a poor foundation, when placed in men whose ambition and enterprise terminate in discredit and dishonor to themselves, and financial loss to others. Ambition and enterprise sustained by good judgment and sound business sense has given to the world a multitude of splendid results, but millions of ambitious and enterprising *frauds* have lived only to do mischief; and it is to this latter "class" we referred in our previous article. There are, from time to time, failures in the business world, and some of a character which stamps the parties as business ignoramuses or out and out rogues; in either case creditors are made to suffer loss, and the reputation of many innocent persons prejudiced.

If the two cases mentioned by us were the only ones of the kind on record in these parts, they would have passed unnoticed; but such is not the case; hundreds have done the same thing and some of them many times over, and hundreds of facts are well known, going to prove not only incompetency and egotism, but that which is worse,—deliberately concocted rascalities.

But, with all this, we wish it fully understood that there are at the head and front of the building business in California, sterling good men—mechanics of education and service, honest in nature, heart, and soul, and as competent as men can be made. Of these, good words only can be said. And as time rolls on, there are others, who, being mechanics in an acceptable sense, seek to emulate and equal those whom they have served, and by a judicious, cautious, and careful course, work their way into the fold of good and competent contractors; but the "frauds" of whom we have written, are those who attempt more than they are capable to accomplish, look sensibly at no end from the beginning, care but little for consequences, and through their incompetency and egotism, strongly tinctured with premeditated dishonesty, they make failure of about all they undertake.

Our contemporary further says: "Were the general argument good, there is no visible reason why it should not also apply to painters, plumbers," etc. The general argument is correct, and does most fittingly apply to the "*fraud*" *class* of painters and plumbers in this State,—to painters who, to exemplify and amplify their "*ambition and real enterprise*," compound all manner of base ingredients—soap, plaster paris, benzine, water, and other ingredients possessing no quality of genuine lead and oil paint, nor reputable compounds—and swearing by high heaven that there is not a particle of adulteration in the mixture, and with premeditated and deliberate purpose, by strong assertions of honesty and fraudism of the most brazen character, cheat good and worthy men out of opportunities to perform honest work, and swindle owners without mercy or compunction of conscience; and to plumbers who, incompetent to make a decent "wiped joint," who understand not the first principle of sanitary plumbing, and are refused more than temporary employment as semi menials in any first-class plumbing establishment,—even these, by scores, ape mastership, full of enterprise and ambition; but not that honorable and worthy enterprise and ambition which inspires men of noble purposes to step forth from the ranks of wage earners, fortified by mechanical mastery over the intricacies of the branches to which they have devoted their years of apprenticeship and earlier manhood, to assume the attitude of men ambitious to win like honorable name and position with those who have established themselves as competent and reliable masters of the art pursued.

To the latter our hand and columns are ever open and *free*, and we commend *honorable* ambition and enterprise on the part of any one who, by industry, application, and diligent effort, has won the laurels of competent mechanics, but have no word too severe to use in reprobation of the "*fraud class*," to whom our first article referred, whose ambitions and enterprise is of that debased character that entails dishonor, and reflects discredit upon building and mechanical pursuits.

Master Plumbers' Convention.

A FULL report of the meeting of master plumbers, held at St. Louis the week ending June 27th, appears in some of our Eastern exchanges, from which we gather that the meeting was largely attended, with delegates from Alton, Ill.; Birmingham, Ala.; Baltimore, Md. (12); Boston, Mass.; Brooklyn, N. Y.; Chicago, Ill. (16); Cincinnati, O; Columbus, O.; Cedar Rapids, Ia.; Denver, Col.; Des Moines, Ia.; Hampden Co., Mass; Hudson Co., N. Y.; Kansas City, Mo.; Kansas State; Louisville, Ky.; Muscatine, Ia.; Milwaukee, Wis.; Minneapolis, Minn.; Memphis, Tenn.; Madison, Wis.; New York City (24); Omaha, Neb.; Providence, R. I.; Philadelphia (17); Pittsburg, Pa.; St. Louis, Mo. (13); St. Paul, Minn.; Washington, D. C.; Wheeling, Va. The proceedings appear to have been in every way satisfactory. "It was unanimously resolved to indorse the action of the vice-president in his course taken against the firms who had issued certain documents to the public." The following was passed:—

"*Resolved*, That it is the plain duty of this association to maintain and enforce the integrity of the Baltimore resolution, and that all members of the craft, in self-defense, be requested to withdraw further patronage from dissenting manufacturers, and stand by those who stand by us."

"Your committee recognize that an extremely important element in the sanitary future of all large cities, is a judicious and efficient building law, designating the relative duties and responsibilities of architects, plumbers, and boards of health; and especially to place the legal requirements of plumbers up to the highest standard of sanitary science. We desire the aid and co-operation of local associations in having such laws enacted by the State Legislatures as will clearly define, as above, the duties and responsibilities of each, and for the enforcement of a rigid inspection of all plumbing work. We deem that this is admitted when we plead for law in order to render advanced knowledge available. Our plea is neither ignoble, selfish, nor narrow, as with our success, communities are benefited, as it means healthy dwellings alike for both the rich and poor."

SAN FRANCISCO NOT REPRESENTED.

Why is it that the craft in San Francisco was not represented by some one or more of the most excellent and competent gentlemen, qualified to represent and reflect credit upon the Pacific States, especially San Francisco, by their presence at the Convention? We regret that this fine opportunity has been allowed to pass, to extend the warm hand of California to the members of the plumbing art from Eastern, Western, Northern and Southern States. Unfortunately, neither the representative architects nor mechanics of San Francisco seem to manifest that interest which by all means should exist, of placing themselves side by side with the progressive advancing people of the East. The Chapter of Architects in this city should at once elect some one of their number to be present at the next general gathering of the parent institute, and we earnestly urge that the plumbers take the matter in hand, and at once nominate one or more delegates to be at the next general assembly of their brethren in 1886. Do not let us remain forever exiled from our fellows abroad, and confirm the belief that California is a way off, forsaken land; good in grain, fruits, wine, and vivacious fleas, but not much as far as architecture, plumbing, and the mechanical sciences are concerned. In some respects, California leads; but so long as her talents are shut up under the bushel of unconcern, it cannot be expected that strangers will come among us, and drag out that which should be made manifest by our own will and acts.

Honesty a Beautiful Thing.

BEAUTIFUL in theory, but more beautiful in practice, both generally and in mechanical pursuits; but how about its application in these days of progression and advancement, as a governing and controlling principle among men, in shaping their intercourse and dealings with each other? Everybody appreciates, approves, and *in words* glorifies the theory, teachings, and poetry of true honesty, and loudly commend and applaud the acts of the few who demonstrated the possibility of human kind, at least sometimes rising to that purer life which commends itself as worthy of admiration; but how many are there who make it a rule of life, and exemplify it in even a reasonably, spotless degree—the inner principle considered? The outward rule of being honest as honesty goes, doing nothing not within the law and customs of the times, and the exercise of that higher degree of integrity which places self-interests in jeopardy, when they or the sacred principle of right in the sight of God are at stake, are very different considerations. How many in high and honorable professions, in trades, vocations, and callings of endless names and kinds; how many who from sacred platforms and altars, proclaim peace on earth and good will to man, and make the sanctuary of holiness grand by the sound of words gilded with the accents of eloquence, who are in all things, both of words and acts, pure from the defilement of dishonesty, beyond the words they utter before listening throngs of men and women, and within the limits where they must stand to avoid exposure of human weakness in some form.

It may appear sweeping to thus question, but who that has seen the world, met the sometimes bitter experiences encountered in active business pursuits, and has read, and understands human nature in its more common forms and characters, as developed at the present day, that is not compelled to say, O *honesty*, in thy *purity* thou art *beautiful*, but where, oh where, art thou to be found, and why are thy followers so few?

California Not Reported.

IN many of our Eastern contemporaries, we find the building activities of cities beyond the limits of the city and State of publication, extensively and regularly reported; but rarely, so far as San Francisco and California are concerned, although this Journal, with its full monthly report of Building Intelligence, is regularly received, and other matter from its columns frequently copied and accredited.

This fact would seem to argue that the building interests of this coast were of immaterial consequence east of the Sierras, or that it is best to leave us severely alone, to enjoy the rich fruits of our splendid prosperities, unnoticed. Be this as it may, it is a fact that during the infant days of this Journal's existence, the advance statements forwarded from this office to New York were received with "thanks," and were always duly published; but so soon as this *special correspondence* ceased, San Francisco and California were dropped, and no longer appeared among the notices of cities and States worthy of being reported as prosperous in building improvements.

THREE TERRIBLE CALAMITIES.—The heartless Buddensiek led off with the first, in Brooklyn came the second, while the third was reserved for Jersey City, each inflicting calamity, loss, bodily injury, and death itself. While condemnation too severe cannot be measured out to men, who, from mechanical and moral baseness, become the agents through which such occurrences transpire. The Jersey man is entitled to some small degree of pity and sympathy, inasmuch as by the work of his own hands, three of his family were the victims of his wrong doings; the greater pity being, that he, instead of the innocent ones who looked up to him, was not buried beneath the ruins of his own creation.

LABOR STRIKES.—They have been numerous within the past twelve months, in various parts of the country, but, as a rule, the "strikers" have won—the employers generally yielding, receding, or compromising. The argument, in this State, of facts rather favors the conclusion that the present and future business and trade prospects are good, and that production must go on. Were it otherwise, and appearances seemingly justifying a continuance of the conflict on the part of employers, it is not likely that they would have vacated their demands for reductions, or submitted, as they have in some cases, to increase of wages. It may therefore be fairly argued that the conditions and prospects generally are in no wise discouraging.

Crazy Quilt Architecture.

THE following from the pen of Bill Nye, in the Chatanooga *Times*, contains more truth than fiction, and is well worth reading:—

"It may be premature, perhaps, but I desire to suggest to any one who may be contemplating the erection of a summer residence for me, as a slight testimonial of his high regard for my sterling worth and symmetrical escutcheon—a testimonial more suggestive of earnest admiration and warm personal friendship than of great intrinsic value, etc.—that I hope he will not construct it on the modern plan of mental hallucination and morbid delirium tremens peculiar to recent architecture.

"Of course a man ought not to look a gift house in the gable end, but if my friends don't know me any better than to build me a summer house and throw in odd windows that nobody else wanted, and then daub it up with colors they have bought at auction and applied to the house after dark with a shotgun, I think that it is time that we had a better understanding.

"Such a structure does not come within either of the three classes of renaissance. It is neither Florentine, Roman, nor Venetian. Any man can originate such a style of architecture if he will drink the right kind of whisky long enough, and then describe his feelings to an amanuensis. Imagine the sensation that one of these modern, sawed-off cottages would create a hundred years from now, if it should survive. But that is impossible. The only cheering feature of the whole matter is that these creatures of a disordered imagination must soon pass away, and the bright sunlight of hard horse sense, shine in through the shattered dormers and gables of gnawed off architecture of the average summer resort. A friend of mine, a few days ago, showed me his new house with much pride. He asked me what I thought of it. I told him I liked it first rate. Then I went home and wept all night. It was my first falsehood.

"The house taken as a whole looked to me like a skating-rink that had started out to make money, and then suddenly changed its mind, and resolved to become a tannery. Then ten feet higher it had lost all self-respect and blossomed into a full-blown drunk and disorderly surrounded by the smoke-stack of a foundry, and with the bright future of thirty days ahead with the chaingang. That's the way it looked to me.

"The roofs were made of little odds and ends of misfit rafters and distorted shingles that somebody had purchased at sheriff's sale, and the rooms and stairs were giddy in the extreme. I went in and rambled around among the cross-eyed staircases and other nightmares till reason tottered on her throne. Then I came out and stood on the architectural wart called the side porch, to get fresh air. This porch was painted a dull red, and it had wooden rosettes at the corners that looked like a bran new carbuncle on the nose of a social wreck. Farther up on the demoralized lumber pile I saw now and then places where the workman's mind had wandered and he had nailed on his clapboards wrong side up and then painted them with the paris green that he had intended to use on something else. It was an odd looking structure, indeed. If my friend got all the material for nothing from people who had fragments of paint and lumber left over after they failed, and then if the workmen constructed it nights for mental relaxation and intellectual repose, without charge, of course the scheme was a financial success, but architecturally the house is a gross violation of the statutes in such cases made and provided, and against the peace and dignity of the State.

"There is a look of extreme poverty about the structure which a man might struggle for years to acquire and then fail. No one could look upon it without feeling a heart-ache for the man who built that house, and probably struggled on year after year, building a little of it at a time as he could steal the lumber, getting a new workman each year, building a knob here and a protuberance there, putting in a three-cornered window at one point and a yellow tile or a wad of broken glass and other debris at another, patiently filling in around the ranch with any old rubbish that other people had got through with, and painting it as he went along, taking what was left in the bottom of the pot after his neighbors had painted their bobsleds or their tree boxes—little favors thankfully received—and then surmounting the whole pile with a potpourri of roof, a grand farewell incumbus of bumps and hollows for the rain to wander through and seek out the different cells where the lunatics live who inhabit it.

"I did tell my friend of one thing that I thought would improve the looks of his house. He asked me eagerly what it could be. I said it would take a man of great courage to do it for him. He said he *didn't care* for that. He would do it himself. If it only needed one thing, he would never rest until he had it, whatever that might be. Then I told him that if he had a friend—one that he could trust—who would steal in there some night while the family were away, and scratch a match on the leg of his breeches, or on the breeches of any other gentleman who happened to be present, and hold it where it would ignite the alleged house, and then remain there to see that the fire department did not meddle with it, he would confer a great favor on one who would cheerfully retaliate in kind at call."

"The Plan Lunatic," supposed to have died out from sheer exhaustion, revived and appeared again in the columns of the *Evening Bulletin*, June 18th. The indications are that semi-dementia has become chronic. Peculiar people and cranks of various types have lived in all ages, and it seems that the architecture profession in California must have some of the kind.

Building Materials.

THE price of materials is an important factor in stimulating or depressing building enterprises. The period of unprecedented building activities which has prevailed in San Francisco during the recent past in particular, has been largely due to the fact of extremely low prices in lumber, which at times has been sold at no profit, if anything above cost of manufacture. Hundreds of houses have been erected within the past twelve months because lumber dealers have been extremely kind-hearted and generous in dealing out materials at but little or no profit; and the slight advance made on the prices of twelve months ago should not be wondered at—the surprise being, rather, that so intelligent a set of business men should have permitted so great a depression below fair and compensating rates.

We have never favored the lumber combinations which placed the products of the forest at prices where the cost of production and profits have averaged more than equal in favor of the latter, nor can we conceive any rational and good reason why a commodity so generally and largely in demand should be sold without profit, or so near production cost that dealers barely saved themselves from actual loss. There should be a rule of *common equity* between producer and consumer, the one never seeking to obtain exorbitant and extortionate values, nor the other refusing to pay a fair and right advance over cost on their purchases.

But so long as lumber manufactures and dealers, having full contro' of matters in their own hands, cause fluctuations in rates, they must expect that consumers will take advantage of the inducements offered, and glut themselves with supplies on a low market, and leave sellers to enjoy all the glory of advanced rates, to find customers among those who must of necessity purchase; while a system of steady prices, at fair remuneration to producers, would create a steady demand all the year round.

A demoralized condition of things in prices of material, for the time being, stimulates some to build who otherwise might not do so "just now;" but there are only a few of these who would permit their lands to remain unimproved for any great length of time, with an existing demand for more houses, and the chances of fair rental returns on investments.

However, if dealers and producers deem it a good and wise policy, and profitable to break the market occasionally, they may depend upon consumers availing themselves of the advantages presented.

Man has a various nature, which requires a variety of occupation and discipline for its growth. Study, meditation, society, and relaxation should be mixed up with his physical toils. He has intellect, heart, imagination, taste, as well as bones and muscles; and he is grievously wronged when compelled exclusively to drudgery for bodily subsistence.

Royal Institute of British Architects.

THE report of proceedings for 1884–85 has been received, from which we quote: "The secretary announces a large number of donations and purchases to the library." "Every newly elected Metropolitan Fellow and Associate is required to make donation in coin, or furnish an original paper." A pamphlet from M. Charles Lucas, of Paris, has been received by the library, describing his visit to the Conference of Architects held in London last year; together with a critical review of the last two published volumes of transactions 1882–83, and 1883–84, and other matter relating to architecture in England, all of which were regarded as highly and sincerely complimentary to the Institute. The Institute is, beyond question, one of honorable reputation and high influence, yet the report continues: "Professor Kerr, *Fellow*, in accordance with former notice, submitted proposals for higher operations by the Institute, and suggesting four standing committees on Art, Science, Literature, and Practice." He also read papers prepared by him, reviewing the subject-matter of his suggestions, using in part the following language:—

In the stately language of our Charter of Incorporation, there is assigned to us a primary duty;—"*the advancement of Civil Architecture, as an art esteemed and encouraged in all enlightened nations;* everything short of this supreme purpose is but the inconsiderable commonplace of daily maintenance, the narrow things of the house." "The academical work of the Institute may be thus qualified: (1) *Architectural Art*, the province of taste; (2) *Architectural Science*, the natural philosophy of building; (3) *Architectural Literature*, past and present, and (4) *Architectural Practice*." *A gold medal* was presented to Dr. Schliemann, who had traveled from Athens to receive it. An appropriate presentation speech was made by the president, in which the passage occurs, "The Medal which I have the honor of presenting to you this evening, is the highest distinction in the power of the Royal Institute of British Architects to bestow. It is given by our patron, the Queen, but Her Majesty intrusts to us the task, somewhat a difficult one, of deciding, subject to the Queen's final approval on the most worthy to receive it." The presentation was followed by an appreciative reply from the recipient. Other Medal presentations were made to distinguished gentlemen.

The report of proceedings throughout, exhibit an advanced condition of affairs in the Architectural profession of England, with still higher aspirations and purposes for the future. And while we regret that the fraternity of Architects in the United States have not been able to organize an Institute of like excellence, we congratulate our British brethren upon their success, hoping that they may attain to the highest possibilities, and reach an eminence in the advancements of the age, coequal with the magnitude and grandeur of the profession so dear to every high-minded and honorable member of the Architectural profession.

Compensation for Bids.

OF late there has been much discussion among reliable and responsible contractors as to a system of remuneration for time consumed in figuring on work. It is claimed by some that a great deal of time is lost in figuring on buildings the erection of which is only in the mind of the schemer. It is proposed that the leading contractors form an association and decide upon means of securing pay for figure labor as it is claimed that the contractors have as much right to emolument for their paper work as the architect. They claim it takes time, study, and brains to qualify a person for such work, and why not receive a recompense therefor. Several ideas have been advanced on the subject among them one "that all figures on buildings to cost above a set amount be paid for only to the unsuccessful competitors, the successful one having his remuneration included in the contract awarded him." The writer claims that by such a course architects would be more careful in selecting bidders of acknowledged ability and responsibility and irresponsible men could not send in bids for the paltry amount paid for the work as it would require a bond with every bid. This would be a fair way it seems, and as the owner from the mere fact of his asking for bids, expects to be benefited thereby, it is no more than fair that he should pay for such benefit. Discussion upon this subject through these columns is invited.—*Northwestern Architect and Improvement Record.*

Can We Build Cheaply Now?

THIS question is asked a thousand times every day, be the conditions what they may. "*Cheap*" is the first and all-absorbing idea with three-fourths of those who contemplate building, not that they really want "cheap" constructions, for "*cheap*," *i. e.*, low cost buildings, are poor investments. The import of the question means and implies more than this,—whether good, substantial houses can be erected at about, or for a little less than actual cost of the materials and labor employed in their construction. A proposition of the kind is certainly unreasonable, yet the *delusion of its possibilities* influences many owners, who disregard every other consideration, and fail to realize the equities that should exist between owners, and those who build for them. At present, however, there is nothing used in connection with house building that is not sufficiently low to satisfy any reasonable person, and induce all who desire to, to proceed with their improvements. Lumber is far below the prices ruling one year ago, although a little advanced on the rates of the recent past. Bricks are much less than the prices at which they have been held during the past three or four years, while the great influx of carpenters to this city has made the supply vastly greater than the demand, with the consequent result of wages, less than has ruled since 1880. The cost of hardware, cements, and building materials generally is moderate—much less than in recent, former years; and with the vigorous competitions that rule among the building classes, those who desire to improve their real estate, may feel assured that they will run no risk in commencing operations under the present state of things.

Improvements for Plumbers.

THERE now seems to be some prospect for the master plumbers of the country gaining a point they have long been striving for,—that of making plumbing a separate and independent part of a general contract in the construction of buildings. The question was presented to the Architectural Association of Minnesota by the master plumbers of St. Paul and Minneapolis at one of its meetings last winter, upon which favorable action was taken, and now we see the same course is being pursued by the associations of other States and by the different chapters of the American Institute of Architects. Surely these requests are reasonable and if universally adopted, as they should be, they would eventually be the means of getting rid of the skin plumber. In the present state of affairs it is simply impossible to procure a decent job of plumbing. The general contractor lets the work to whom he chooses, and generally the lowest bidder gets it, no matter what his reputation or standing, or how his work on previous contracts was performed. If there is an opportunity for the contractor to get ahead a few dollars, anything goes. The honorable and creditable plumbers who render full value for money received, and will not undertake to do work at prices where they cannot afford to employ good help, are hampered at every turn by these "skins" who are always as ready to put in a water-closet or set up a hot water tank as to patch a boiler, mend a key, or sell a piece of sheet iron. They are men that can do anything, in their mind, but really nothing as it should be. Is it reasonable to suppose that a job of plumbing can be done as it should be, for $500, when five or six first-class men say it will cost $900 or $1,000? No one can expect that the work will be properly done under such circumstances, and when sickness or death of occupants leads to the discovery of the defects, the plumber is cursed far and wide—for they are all common botches to the one who has suffered. Such tremendous cutting in prices means inferior work and there is nothing else to it. The sooner the old system is abolished of letting contracts to men who know nothing about the work that is to be performed, and care less, the sooner these dishonest practices in plumbing will cease.—*Northwestern Architect and Improvement Record.*

Clay Pipes and Ornamentals.

THE "iron stone" "vitrified" clay pipe, at present so universally in use for sewer purposes, is beyond question the most lasting and practical of all devices in that connection, as it can be moulded into any desired shape or form, suitable for any application, and in duration is without limit or number of years, centuries proving insufficient to mark the impress of decay, when not subjected to special destructive agencies, not found in connection with sewers.

Clay ornamentations and utilities, doubtless cruder in design than those of the present day, are of antiquity far back of the founding of many of the civilized nations of the world; said to be as old in China as 2599 B. C. "The invention of pottery dates from the most remote period, and its application is almost universal—objects of pottery being in use amongst races semi-barbarous. The art of moulding or fashioning vessels of moist clay, and subsequently drying them in the sun, is so obvious that it is not above the intelligence of the suden savage" to give it form and shape, even sometimes that of supposed deities, before which to do homage after their heathen idea of worship. History furnishes a multitude of interesting facts in regard to the manipulations of clay through past centuries, but our object is not to repeat the earlier and evolving facts, but those relating to the manufacture and uses of the

CLAY ORNAMENTATIONS OF THE PRESENT.

There has been a vast amount of skill and handy workmanship developed in the production of ornaments for building and endless other purposes: and the recent past and present taste and demand are for the application of the rich and sometimes beautiful specimens wrought out in clay, many of which are as regular and clear cut as though of softer material, shaped by the keen edge of the carver's chisel. It is also a pleasing fact to know that California produces some most excellent qualities of the crude material, and that the California manufacturers are equal to those of the older States, and are furnishing everything desired, which can be made of clay. The fronts of many buildings, enriched by clay, or terra cotta devices, are to be seen in San Francisco and other cities, and the disposition seems to be to make the use of this material more general. It is well adapted in every practical sense, where elaborations are desired, and the cost and expense is much less than stone, which serves no better purpose.

The Artisan, or Practical Methods That May Be Applied to Works of Building and Other Constructions. New edition of 1885. Among the practical ideas in this work will be found the utility of the right angle, and its application in s living many useful problems. By means of a right angle the exact circumference of a circle is determined at once. It also shows a simple and correct method for the measurement of boards, floors and other surfaces. It is applied to lines of any length, and divides them into equal parts. It gives the cuts and lengths of rafters, bracss, and other timbers in framing. There can be no doubt as to the value of a right angle and its utility in this connection. It is clearly illustrated in the *framing square*, a tool which solves nearly every problem in practical geometry. **Price, Five Dollars.**

Afraid of Plumbing Work.

THE necessity of perfect work in this branch of mechanism is universally admitted; and when thinking, intelligent people begin the work of preparation for building, among the first thoughts suggested is good plumbing work. With many, there is a sort of "holy horror" connected with placing even the best improved sanitary plumbing fixtures within the walls of the building contemplated, and some are so firm in their resolves upon this point that no advice or persuasion from architects or others is sufficient to change the determination; nor is it always a mere notion with such persons; those who have had the deep sorrows of sickness, and perhaps death itself among their loved ones, enforced upon them, with well-authenticated proofs that the agency thereof has been defective plumbing work, have sufficient reason to fear and tremble at the sight of that which bears the name of the evil genius that is believed to have done its deadly work; and palliations, theories, persuasions, and arguments fail to remove the dread and fear caused by former experiences. When the mind becomes impressed and impregnated with a conclusion against any one thing, it is difficult to dissipate the impress made, and that which produced the result must forever bear a repugnance, and appear in the light of a treacherous, dangerous enemy.

That such sentiments and aversions should exist is not to be wondered at, but it is a well-known and well-established fact that there is no feature of house construction which so directly connects home-life with the dreaded and to be feared consequences ever and always attending defective plumbing work, and the inlet of sewer vapors to apartments occupied by human kind, especially to rooms where people sleep, in which free and perfect ventilation does not exist. The stealthy midnight robber may carry off precious jewels and valued treasures which may be recovered or replaced in time, but when priceless lives and human health is seized upon by inhalations as gentle, if not so sweet in perfume and action as the sweet zephyrs of spring, yet fatal in consequences, the occasion for fear and caution is at hand; and he who disregards all this, betrays a folly most unwise. The direct application of these thoughts is twofold,—that owners should be exceedingly careful in selecting an architect who, in *real fact*, enjoys a thoroughly practical as well as theoretical understanding of the sciences of the plumbing art, independent of, and equal to the best of practical plumbers; and secondly, not to intrust so important and essential a matter to any living being not beyond all doubt and question fully competent in all respects, practically, and trustworthy, and honest with all; for it may be that a man may *know enough* to enable him to do all that is right, good, and proper, but a deficiency in moral or mechanical *integrity* may outweigh the good, and practically make him a more dangerous man to trust than one of less knowledge and more earnest and careful interest and purpose.

The Best Sash Pulley Made.

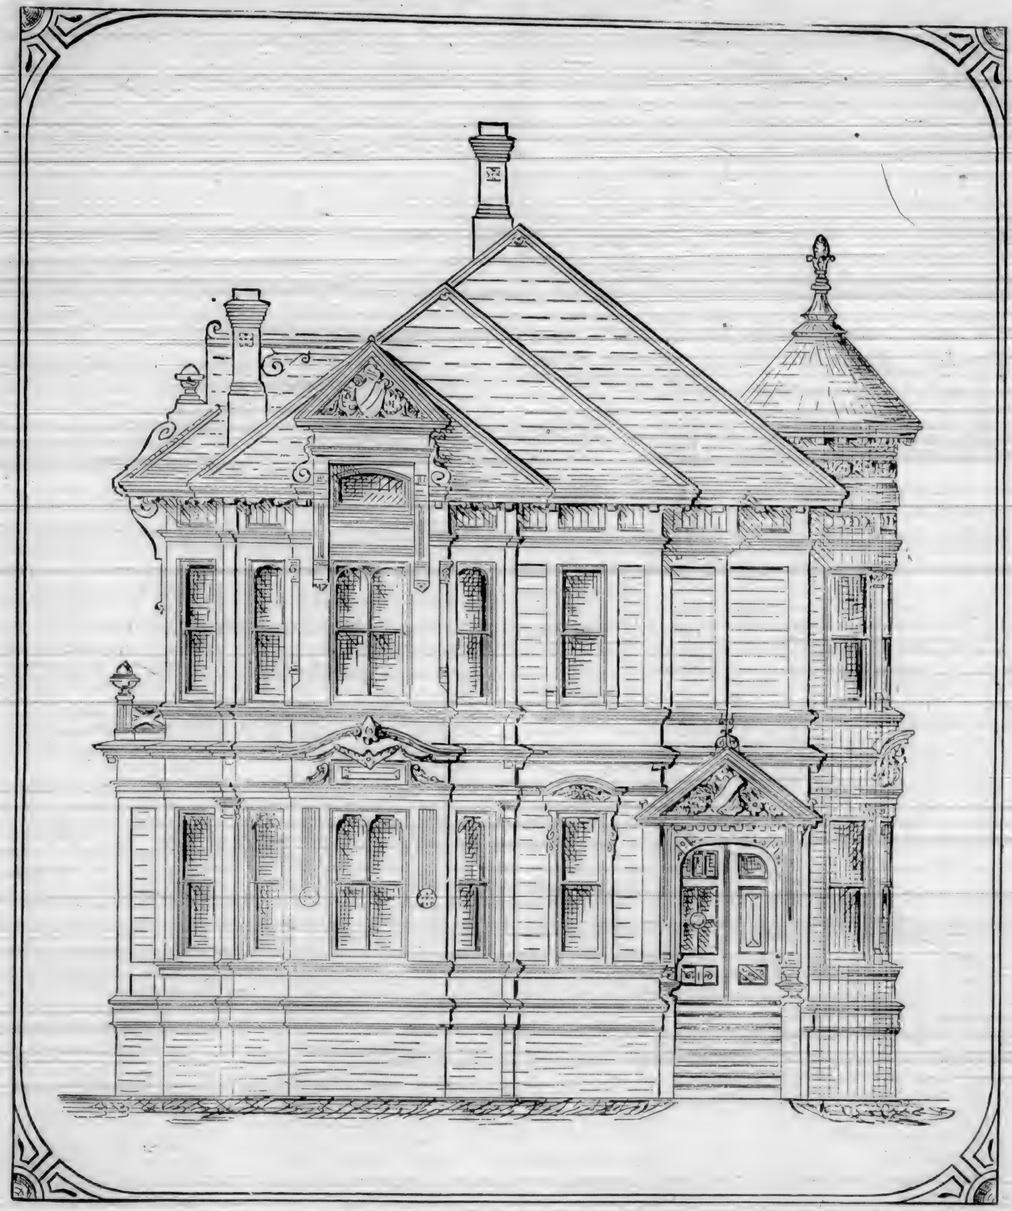
WE have received from C. Sidney Norris & Co., Baltimore, a sample board of sash pulleys, which are the best we have seen, ranging from some very handsome, bronze face plates, down to ordinary iron for general use in the cheaper class houses, but all of the same general construction, which differs from the pulleys in common use, and are much more serviceable.

The motion of the wheels is smooth and noiseless, and the manner of seating the lower end of the shell in the wood, with but one screw in the face plate, gives them great strength. One of the devices contains double pulleys in each shell, to provide for two "chains" or cords in cases of sash with extra heavy plate glass, so that one of the chains breaking, the remaining one would hold the weight of the sash, and prevent a fall damaging too expensive glass; and at the same time, the chains plying over two separate pulleys, make them run easily. They are well worthy the attention of architects and owners; to be seen at the office of this Journal.

MORTAR.—Mortar for sewer works in all cases should be capable of setting in water. Portland cement and lias limes make good hydraulic mortar. The proportions of cement, or of lime to sand, should not exceed two and a half of clean, sharp sand to one by measure of ground Portland cement or lias lime. If clean furnace ashes or slag are available, there may be two of sand and one-half of ashes or slag, the whole to be mixed in a revolving pan, each pan-full to have twenty minutes' grinding. When mortar is used with bricks, the beds and joints should be spread thick and full over the entire area of both bed and joint, leaving, when pressed into place, a bed and joint never less than one-eighth of an inch in thickness of mortar. In four cubic yards of completed brickwork there should not be less than one cubic yard of mortar incorporated. In making mortar or concrete, it will be of the utmost importance to use clean materials and to preserve them clean. The water used for wetting bricks and for mixing concrete and mortar must be free from silt. Concrete and mortar should also be used on clean surfaces.—*Sir R. Rawlinson, C. E.*

Eastlake Paint, said to be a great improvement even upon the best lead and oil compounds, guaranteed not to contain gum, rosin, benzine, or turpentine, but to be made of pure lead, zinc, and oil only, with a chemical solution that renders the paint hard and glossy when spread, alike resisting the action of fogs and heat, and free from the oxidation or chalking so commonly the case in California. It is manufactured by the Eastlake Paint Co., San Jose.

If this paint possesses the qualities claimed for it—we know nothing to the contrary—it certainly will be to owners' interest to use it,—first, for its excellence, and secondly, because manufactured in California.



ELEVATION OF COUNTRY DWELLING.—PLATE I.

Tenants Benefited.

As soon as people acquire wealth and are able to reside in dwellings of their own choosing, they immediately develop a surprising interest in "dwellings for the poor," and the sanitary papers, as well as the daily press, are made to do duty in describing the unsanitary conditions in which such a large proportion of the population live. Heretofore, the poor have been benefited, silently, by all the philanthropy which has been bestowed upon them by sympathetic societies. Up to the present time there has been no one so rash as to defend the conditions which are so threatening to the continued low death-rate of our various countries, Scotland in particular.

The enterprise of a London illustrated journal has led it to send an article to depict the mode of life of the crofters in Scotland. The pictures and accompanying letter-press represent the dwellings of the crofters to be of the most primitive construction, being little better than rude huts, having no light or ventilation save through an aperture at the top, through which the smoke escapes. The evils which must advert the dwellers in these huts is graphically described. To this attack, strange as it may seem, there arises a defender. A Highlander, born and reared in one of these 'bothies" writes to the London *Times* that, to the peculiar construction of his boyhood's home, he owes the strong frame and unimpaired health which he enjoys to-day. He states that the ventilation is ample and sufficient, and, furthermore, that the breathing of the smoke from the peat fires, habitually found in the "bothies," renders the system very insusceptible to consumption. This latter statement is supported by the testimony of a prominent physician of Manchester. He states that there is a remarkable immunity from consumption among the Highland people, and he ascribes it largely to the inhalation of peat-smoke, which, he says, contains many ingredients of an antiseptic character, such as tannin, tar, and creosote.

Roman Tenement Houses.—The Romans had to contend with the evils of enormous tenement houses two thousand years ago. Gibbon mentions that Augustus and Nero repeatedly enacted that the height of dwellings within the walls of Rome should not exceed seventy feet from the ground. The space within the Roman walls was necessarily circumscribed. Much of this was occupied by the rich patricians and senators, with their palaces and gardens, so that the body of the Roman people were crowded into high tenements, and the different floors and apartments were divided among several families of plebeians, who suffered consequently in health and comfort. Juvenal, recognizing the unfortunate condition of the poor in this respect, advised them to leave the city and seek homes in the small towns.—*Exchange.*

AROUND THE HOUSE.

The Exciting Rage for Æsthetic Jimcracks, And What There Is to Gratify It.

The collection of æsthetic ornaments of bric-a-brac, etc., is, with many, a question of arithmetic. The question is mainly one of ability to buy and a space to display; the intrinsic worth of many of the specimens is slight, and it must be owned that the taste exhibited is abnormal.

Bric-a-brac ornaments, to deserve a conspicuous place in a room, should possess one or more of these attributes of excellence:—

1. Historical, representing an interesting phase of art in an earlier period.

2. Artistic, being in their design and execution conformable to the standards of artistic truth and beauty.

3. Social, calling to mind an earlier phase of social life and custom.

4. Personal, association with noted persons, or personal friends and relatives.

Any of these give value to such ornaments and justify their use to a certain extent. But they should be few in number and should be judiciously chosen and tastefully arranged.

Among new devices for mantel piece ornaments is a light-house wrought in copper and carefully elaborated in details, which carries two disks on the lantern, one showing the time, the other the days of the month and the moon's changes. Another idea is the mounting of a gold cage and bird over a clock, the bird flapping its wings through a hidden connection with works on the striking of the hours.

Movable Japanese screens have a wooden stand, carved, with two large fancy-colored paper fans fixed out at the top, folding up and pointing downward at the sides. These move up by means of a spring, meet in the middle, and form a large circle.

A clever conceit is a card-receiver of hammered copper in the shape of a large grape leap. Ornaments of lizards, beetles, and queer-looking bugs are used.

A very clever plaque is of royal copper metal, with lapped edges and hammered. The center shows a Hungarian scene in gold and silver effects.

A drawing-room mirror, made in the shape of a fan and mounted in bronze or silver, is a very pleasing novelty.

The new metal, royal copper, is now being made up into all kinds of artistic metal goods.

Scorpions, snakes, and lizards are the latest French rage in metal goods ornamentations.

Parties when asked what they would charge to furnish corn enough to cover a checker board, placing one kernal on the first block, two on the next, four on the next, and so on, have answered from $5.00 to $10.00. Local mathematicians have figured it up and find that it would take 8,680,760,438,824¾ bushels, estimating it at 200,000 kernals to a bushel, which at sixty cents per bushel amounts to $5,208,402,203,294.85.—*Ithaca Journal.*

Decorative Art in Gotham.

In the new dining-room of Cornelius Vanderbilt's house some remarkable triumphs of the decorator's art are to be seen. There is a reproduction of Gobelin tapestry, which cost Mr. Vanderbilt $30,000. A portiere which is to hang at the dining-room door is literally a *cloth of gold*. It measures six feet by four, and hangs upon an oaken bar with rings of gold. To prove that it is a cloth of gold it is only necessary to state that Tiffany & Co., the jewelers, under the direction of an artist, spun from pure gold a thread which composes this hanging, at a cost of $20,000. Miss Tillinghast, whose work of design and embroidery is at the head of that particular art in this country, and possibly in the world, undertook, with her assistants, the embellishment, with the needle, of this cloth of gold. The picture represents certain scenes of the Æneid. If the hours spent upon it were reckoned by the eight-hours-a-day system, four years and a half would be the result shown of the time consumed.

Rapid Bridge Building.

A bridge of concrete, thirty-three feet in span, and carrying a roadway thirteen feet wide, and capable of supporting safely a load of two hundred tons, was recently built in Switzerland in a single day, under the direction of Professor Tetmaier, of Zurich. According to *Le Génie Civil*, the bridge was a single arch, of segmental profile, rising six feet and a half from springing to crown, and twenty inches thick at the crown, and forty at the springing, with abutments ten feet thick. The concrete used for the arch was composed of one part cement, mixed dry with two parts sand, and the whole then mixed with four parts of gravel, and water enough to cause a light sweating as the concrete set. For the abutments, three parts of sand and seven of gravel were used to one of cement. All the materials were made ready beforehand, and at six o'clock in the morning the construction of the abutments was begun. As soon as these were brought to the proper height, the center was set in place and the arch turned, and tympanum walls built up on each face of the arch, to the level of the roadway. Gravel was then filled in over the arch, between the tympanum walls, to the roadway level, and the bridge was pronounced finished, the whole work having been completed in twelve hours, at a cost of six hundred and four dollars, including the expense of an iron railing on each side. It would have been foolish to permit vehicles to pass over the bridge at once, and two months were allowed for the hardening of the concrete, after which a heavy traffic immediately began, without any apparent injury to the construction.

A chicken with a clipped wing made several ineffectual attempts to fly over a fence. An Irishman, who witnessed the efforts of the "chick," laughingly exclaimed, "Begorra, she has a defective flew."

A model architectural competition seems to have been that lately concluded in Leipsic, Germany, for the governmental judiciary buildings or law courts. From an interesting account in the Leipsic *Illustrirte Zeitung* we gather the following: The size of the building is approximately 100 by 130 meters, or about 325 by 422 feet. The programme was complicated and difficult, including session chambers for six or seven different courts, a large assembly hall, rotunda and stairway, reception rooms, consulting rooms, offices, etc., for a great number of chiefs and subordinates in each department, and finally a library to hold 150,000 volumes, with administration rooms, etc. The general conditions of the competition were unusually simple and fair, imposing the least possible restriction upon participants. They prescribed the number and size of drawings for each design and required a descriptive memoir with approximate estimate of cost. The limit of cost was not fixed but was left, very wisely we think, discretionary with the architects themselves. The committee of award consisted of six architects and five members of the judiciary. There was one prize of 8,000 marks, about $2,000 of our money, two of 4,000 marks each, and two of 2,000 marks each, the premiated designs to belong to the Government. The time allowed to competitors was nearly five months, another judicious feature! One hundred and nineteen designs were received, each embracing not less than ten sheets—nearly twelve hundred drawings in all. All were exhibited for two weeks in the winter garden hall of the Leipsic Crystal Palace, and attracted much public attention, as was natural in so important a competition, and with such a cultured community. —*Inland Architect and Builder.*

First Floor Plan of Country Dwelling.—Plate 2.

Corrugated Iron.

This is a material largely used for various purposes, and is well adapted, among other things, for roofing. We notice that the *Cincinnati Corrugating Company*, for which C. J. Tallon, 123 California Street, is agent, have received the "*Gold Medal of the First Class*," for corrugated iron for building purposes, at the World's Industrial and Cotton Centennial Exposition at New Orleans."

Corrugated iron is often used in the construction of certain classes of buildings, and is admirably adapted for barns, grain warehouses, and other buildings erected on farms and in places remote from fire engine protection; also in the construction of light way walls, to make them comply with the requirements of fire ordinances, where brick is not feasible or possible. The lightness of walls constructed of this iron is also a recommendation, as it affords protection against fire, without bulk or great weight.

The signs "+" and "—," it is said, were first used by Christopher Rudolph about 1524. The sign "=" was first employed by Robert Recorde in 1557." "Because," said he, "noe 2 thynges can be moare equalle."

Ancient Reservoirs.

The reservoirs of the ancients were not inferior to those of the present time. The expertness of the ancient engineers is attested by the remains extant; they certainly are not buried in the waters of the Lethe. The Pools of Solomon still continue to furnish water to Jerusalem. They are three in number. The upper is 160 feet above the middle one, the latter 248 feet above the lower. The first was supplied by pipes from springs, and, when full, emptied into the second, and that into the lower one. The water was used for irrigating Solomon's gardens and supplying his temple. The lower pool held about 31,442,425 gallons, the middle about 12,289,912, and the upper one contained 13,778,772—a grand total of 58 511,109 gallons, or nearly six times as much as the Kansas City reservoir, which is estimated at 10,000,000 gallons. These pools were solid rock and masonry, lined with cement, and had steps leading to the bottom. One historian says that Nebuchadnezzar, wishing to brick the bottom of the Euphrates, which flowed through the center of Babylon, caused a reservoir forty miles square to be dug, so as to allow his masons a dry river-bed. Another historian writes that Nitocris, a daughter of Nebuchadnezzar, is said to have dug a reservoir 420 stadia in circumference, lined with stone, for the waters of the Euphrates, in order that the river-bed at Babylon should be dry, so that she could build piers for a bridge. A stadium being 625 feet, it would make this circumference 49 miles. These two reservoirs may be the same, and this shows what discrepancies there are among writers.—*Building and Engineering Times.*

An Architect's Suit Decided.

In the Second District Court, Judge Henry has filed a written opinion in the case of Charles D. Marvin against Dr. Clarence W. Butler and wife. The case was tried in March last. The facts were, that the defendants employed the plaintiff, a New York architect, to prepare plans and specifications for a dwelling-house, to be erected on Fullerton avenue, Montclair. After the plans and specifications were drawn and the contractor's bids submitted, the defendants refused to accept the plans and thereupon the architect demanded the usual commission for his services, on which, being refused, he brought suit. The defence, interposed by the defendants was two-fold; first, that the plans called for a building which if erected, would project beyond the defendant's lot a few inches; second, that the lowest bid of any contractor exceeded the stated amount the defendants wished to spend on the building. In reply, the plaintiff proved that the measurements of the lot were furnished by Dr. Butler, and therefore the error had been occasioned by the defendant's mistake, and that the changes in the original plans, made at the request of the defendants, had occasioned the increased cost. Judge Henry, after hearing A. E. Van Giesen for the defendants, and E. A. Rayner for the plaintiff, in a lengthy opinion reviewing both the law and the facts, holds that the plaintiff is entitled to recover a reasonable compensation for his services in preparing the plans, etc, and gave judgment in his favor.—*Building.*

Disinfectants.

It is often asked what is the best disinfectant for a cesspool? Two pounds of copperas, or sulphate of iron, dissolved in a pail of water, will greatly assist in purifying a privy or cesspool. A pound of nitrate of lead dissolved in the same way is excellent for sinks, drains, or vaults. Chloride of lime is also effectual, or a layer of charcoal dust will prevent offensive odors arising from any decomposing substance. The quantity of these substances will depend upon the amount of filth to be deodorized, and the length of time during which they will be effectual will depend upon local conditions.

The Japanese Hand-saws cut on the pull stroke; so no matter how hard the wood or dull the saw, they will not bend or buckle. It is rather more difficult to saw to line with such saws than with ours, but they have their advantages. Take one of our key-hole or compass saws, cutting on the push or shove stroke—what an aggravating, limber thing it is. Now point the teeth the other way, and you will have a tool that will keep stiff no matter how many knots it encounters or how dull it gets. In other words, the pull stroke of 3,000 years ago is the best for such thin, narrow blades.

Stair Building Made Easy **$1.00**

New Law in Tax Titles—No More Extortion.

One very important amendment was made by the last Legislature in relation to the issuing of deeds on a sale of property for delinquent taxes:—

"It is now provided that the purchaser of property sold for delinquent taxes, or his assignee, must, thirty days previous to the expiration of the time for the redemption, or thirty days before he applies for a deed, serve upon the owner of the property purchased, or upon the person occupying the property if said property *is* occupied, a written notice, stating that said property, or a portion thereof, has been sold for delinquent taxes; giving written notice of the date of sale, the amount of property sold, the amount for which it was sold, the amount then due, and the time when the right of redemption will expire, or when the purchaser will apply for a deed. The new amendments provide that the owner of the property shall have the right of redemption indefinitely *until such notice shall have been given* and said deed applied for, upon the payment of fees, percentage, penalties, and costs required by law. If the property sold is unoccupied, it is then provided that a similar notice shall be posted in a conspicuous place upon the property, at least thirty days before the expiration of the time for redemption, that is, thirty days before the purchaser applies for a deed. It is further provided that the Tax Collector shall not issue a deed to the tax-title purchaser until such purchaser shall have filed an affidavit with the Tax Collector showing that the notice required to be given has been in fact given as required. This affidavit must be filed and preserved by the Tax Collector as other papers are kept in his office. These new amendments will prevent tax-title extortion. Heretofore, when the time of redemption ran out—in one year from date of tax sale - some tax-title buyers asked $250 for a tax title that cost them $15 to $25. Many owners' property was sold for taxes because of their ignorance that the taxes were delinquent. The tax-title buyers will now be compelled to give delinquents notice before they can get tax deeds."

To Make Watch Hands Red.—Mix to a paste, over a lamp, one ounce of carmine, one ounce chloride of silver, and a half ounce tinners' japan. Put some of the paste on the hands, and lay them face upwards on a sheet of copper, holding it over a spirit lamp until the desired color appears on them.

Onyx.—Onyx is deservedly a favorite for table tops. Its semi-translucency, with dappled shades from saffron to white, delicate tinge of green and grain formed of wavy lines render it peculiarly attractive.

All varnishes crack from the surface, and paint cracks from the bottom. The presence of ammonia in the atmosphere is the greatest enemy to varnish, as it weakens the cohesion between the oil and gum.

The Safety of Cast-Iron Columns.

The safety of cast-iron columns in case of fire, as compared with columns of wrought iron, or pillars of stone, brick, or cement concrete, has been the subject of investigation by Professor Bauschinger, of Munich. It will be remembered that the Berlin police authorities, in consequence of unfavorable experiences with cast-iron columns in recent fires at Berlin, issued regulations forbidding the use of such supports in the construction of dwelling houses, but permitting the employment of columns of wrought iron and clinkers in cement mortar. Cast-iron columns may only be employed if they are surrounded with immovable mantels of wrought iron separated from them by an air space. Professor Bauschinger heated cast and wrought-iron columns weighted with burdens usually imposed in structures first to 300°, next to 600°, and finally to red heat, and suddenly cooling them afterwards by a jet of cold water, as applied in extinguishing fires. The experiments demonstrated that cast-iron columns, although they were bent by red heat, and showed transverse cracks when water was applied, supported the weight imposed upon them, whilst wrought-iron columns were bent before arriving at a state of red heat, and were so much distorted by the application of water that a straightening was out of the question. In reality they would have collapsed under the weight they had to support. Professor Bauschinger concludes from his experiments that cast-iron columns, notwithstanding cracks and bends, would continue to support the weights imposed upon them, whilst wrought-iron columns would not. In examining pillars of stone, brick, and cement concrete, the latter proved to be the best. Concrete pillars withstood the action of fire for from one to three hours; those of ordinary brick, as well as those of clinkers set in cement mortar, displayed great resistance; whilst natural stone—granite, limestone, and sandstone—were not fire-proof.—*Illustrated Carpenter and Builder.*

The oftener carpets are shaken, the longer thy wear. The dirt that collects under them grinds out the threads. Do not sweep carpets oftener than is necessary. A broom wears them very much. When a carpet is faded, strong salt and water will often restore the brightness of the color.

George H. Fuller, manufacturer of and dealer in all kinds of office, school, church, and lodge furniture, and fine cabinet work, has removed from New Montgomery Street to 638 and 640 Mission Street. Those desiring things in his line, may rely upon square and honorable dealings and good work, whether under personal arrangements or by orders from sections outside of San Francisco.

To remove varnish without injuring paint. Brush on spirts of ammonia or hartshorn, which soon softens the oil, allowing of its being rubbed off easily.

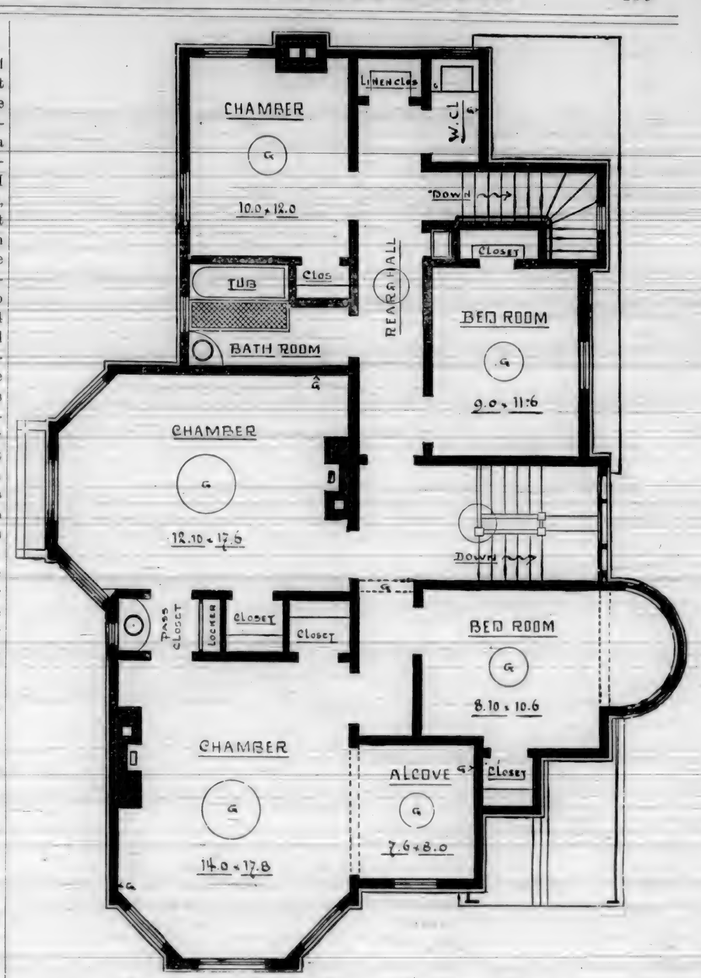
Going Up-Stairs.

Many persons complain of the fatigue of mounting long flights of steps, and feel that they are failing before their time. There need be no anxiety on this score. Going upstairs is simply performing so much work in a given time. Mr. G. Farmer, who has investigated this subject, says: "Just for curiosity I sent my assistant, who weighed 152 pounds, to climb the stairs at the Forty-second Street Station, to note the time in seconds which was required to climb them leisurely. He counted the stairs, 36, and it took him 34 seconds to climb them. The rise of each step was 8 inches; total rise, 8x36=288 inches=24 feet. Now, his weight, 152 pounds, multiplied by the total rise, 288 inches=43,786 inch-pounds = 3,648 foot-pounds of work done in 34 seconds. Now, one horse-power does 550 foot-pounds in one second, and in 34 seconds will do 34 × 550=18,750 foot-pounds; now divide 3,648 by 18,750, and we get 195, almost 1-5th of a horse power, which this young man exerted while he was climbing these stairs leisurely. He said he usually went up two steps at a time when in haste. Now let us compare this work with that done ordinarily while walking on level ground. His average step when walking rapidly would be not far from 26 inches, and the distance from the ground to the thigh-joint would be not far from 33 inches; thus at every step he lifts his center of gravity $2\frac{5}{8}$ inches—all, or nearly all, his weight above the knees will be raised $2\frac{5}{8}$ inches at every step. Assume that 130 pounds would be lifted $2\frac{5}{8}$ inches at every step, this would equal 341 inch-pounds per step. Now, divide 43,776 by 341, and we get 128.4 steps, which multiplied by 26 inches, gives us 3,338.4 inches=278 1-5 feet as the distance he would have to travel in 34 seconds to do work equivalent to climbing those stairs.

$$\text{"This is } \frac{287.2 \times 3\,600}{34 \times 5.280} = 5.58 \text{ miles per hour,}$$

which I think is an under estimate. How few invalids—ay, how few tired persons could maintain this pace even for half a minute without great fatigue!"—*Exchange.*

Hereafter the highest building in New York must not exceed an altitude of eighty feet. The law does not, however, prohibit the erection of giant office buildings or great business structures. This may be well, as the convenience of business may require the concentration of offices on a small area, but we feel that the law is an excellent one as applied to the residential portions of the city. With our elevated roads and the probable progress that will be made in rapid transit, there is no occasion for the immense apartment houses that have been built in the last few years. Should the city's population continue to increase as it has done, spread it out over the 23d and 24th wards and lower Westchester, and better and healthier homes will be provided for the people, and it will be far more equitable as regards the rights of adjacent owners.—*Building.*



Second Floor Plan of Country Dwelling.—Plate 3.

Next to a good house nothing is more desirable than a good side-walk, but the one is not always accompanied by the other, and hence the incongruity. A bad side-walk is not altogether the result of individual negligence, since the municipal authorities are supposed to have jurisdiction over them, but at the same time property owners should not consider themselves freed from all responsibility. It is no uncommon thing in any large city, to see a house and grounds magnificently appointed and well kept, while the approaches are in a state of extreme dilapidation.

Why are so many houses, especially farm houses, in the United States painted white? A neat white house surrounded by green trees and shrubbery, is often a very pleasing object in the landscape, but a grim rectangular structure, standing unrelieved as many houses do, receives a glaring addition to its ugliness by the coat of white paint which covers it. Neutral colors are rarely offensive, and easily obtained. Only conservative inclinations cause the present style, and in this matter good taste should not be influenced by bad example.

A metal that expands in cooling is made of lead, nine parts; antimony, two parts; bismuth, one part. This alloy can be advantageously used to fill small holes and defects in iron castings.

How Mosaic Work Is Made.

ONE of the few industries of Rome is the manufacture of mosaic, the largest establishment being under the control of the church, and employed almost entirely in the adornment of the churches and religious establishments. The process of making a picture in mosaic is very slow, and requires the highest order of skill. To begin with, mosaic is made of glass, and its value consists in being indestructible. The workmen in great pictures, have to have something over twenty-six thousand shades of colored glass to produce the tints requisite, as in a mosaic every color is necessary, the same as in oil painting. To make a picture the process is this: A plate of metal of required size is surrounded by a raised margin an inch in height. A plastic cement of powdered stone, lime, and linseed oil is spread over the bottom of the plate, and that covered with plaster of paris to the level of the rim. Upon this the picture to be made is very carefully drawn, and the mechanic's work begins. He takes a piece of glass of the exact tint necessary, and fits it to its place, grinding it to get the shape. Then he goes on one piece at a time, till the picture is finished; then the face is ground down to a smoothness, and the picture set in its place. Some of the greatest pictures of ancient and modern times are in mosaic, the tints, with all the delicate shades, being as carefully reproduced as in oil, and the effect being even greater. The ceilings of many of the great churches are entirely of mosaic as well as many of the altar pieces and other decorations. As they are entirely indestructible, and never lose their color, they are very much prized. A picture in mosaic costs, but then it is eternal, barring fire and earthquakes. All over Rome there are small shops devoted to the manufacture of mosaic table tops, box covers, etc., the workman toiling all his life on one subject. The man who begins on St. Peters on table tops, or the Coliseum, never does any other subject, and he becomes so skillful in this one subject that he is enabled to make them not only well but cheap. He has only the tints to manage that enter into the one picture, and he places them mechanically and very rapidly.

Plumbers' Association.

THERE are some excellent provisions in the code which govern the Philadelphia Master Plumbers' Association, and new associations cannot do better than to follow it closely in the preparation of their constitution and by-laws, and established associations might take some hints for revision from it. The sanitary committee, which consists of ten members, has entire charge of all sanitary matters pertaining to the trade. They are given power to form themselves into a sanitary plumbers' club. This is the origin of the club, which has already been referred to in these columns. The object is mutual benefit and the discussion of improvements in sanitary plumbing. This committee has power to add to its number, from members of the association, and to invite well-known sanitary experts to attend its meetings. One of the objects of the association was to establish a plumbers' trade school. For this purpose, a trade school committee was provided, consisting of twelve members, who were given power to elect their own officers, and conduct the affairs of the school, subject to the approval of the board of directors. The good results of the trade schools are already being felt. The plumbers elsewhere should not fall behind in this important matter.—*Sanitary News.*

Improved Tenements in New York.

IN New York, a company has been incorporated with a capital stock of $150,000, divided into shares of $25 each, for the purpose of building tenement houses of a superior quality. The president of the company is Mr. Joseph M. Drexel, and Mr. Oswald Ottendorfer is vice-president. The plan, which is one that has been tried successfully in France, is to provide tenements which shall be healthful, and otherwise desirable, at the same prices as are now charged for the miserable quarters, in which so many are compelled to live—$8 to $14 a month. The company expects to get a net income of at least 7 per cent. on the investment, and 4 per cent. will be set apart to pay dividends on the shares, the remainder being accumulated as a reserve fund to protect the shareholders; for the benefit of the tenant, who will be credited with interest in proportion to the rent paid by them. These credits the tenant can apply to the payment of rent whenever, "by illness, age, lack of employment, or other good cause, he shall be unable to provide for himself or family." Any tenant can become a shareholder, and the plan is no doubt a good one and deserves the attention of capitalists in all our large cities. A large part of the shares have been taken, and a building site has been selected.

Brick Wall Discoloration.

A CORRESPONDENT in the *American Architect*, in answer to a writer who took the view that the discoloration of brick walls was caused by bricks being burned with coal, says that the whiteness appears equally on bricks burned with wood, and where, in the manufacture, no coal dust is used, and that from time immemorial bricks have thus appeared white. "They were so seen in Boston a century before coal was used, or much known as a fuel by its inhabitants. I assume that, even now, the use of coal dust in the manufacture of bricks is simply local, and an exception to the rule, and in most country places it probably never will be used; yet in special examples of bricks made thus the whiteness appears all the same." He further adds that soda in one of its forms is the cause, and that simple water dissolves it; and that "linseed oil as a coating is an excellent treatment but the best success has been attained where dilute muriatic acid has cleansed the pores in the bricks, and thus permitted the oil to further penetrate.' Speaking of kerosene oil, he said: "This material penetrates the brick to a depth of about a half-inch, where they are of an average hardness, and dissolves the soda, but the oil, lacking the body that linseed oil has, affords much less protection, from the atmosphere, and has proved to be of only temporary value."—*Brick Tile and Metal Review.*

Whims in Building.

NOTHING adds so much, says the *Studio*, to the cost of building as the indulgence in whims. To set out deliberately to do a "queer," "fanciful," or, as it is sometimes called, "original" thing in building, is always to incur unnecessary expense. If we look through the books that contain pictures of the architecture of all ages and nations, we shall find that, without an exception, in the times all men of taste are agreed in calling the good times, the modes of building have been sensible, founded on the needs of the case, and that whatever may seem fanciful—the whole of what we call picturesque - when its charms have proved enduring, is the result of what we may call, in every case, "accepting the situation." Nothing has been done in such instances for the sake of being picturesque. Good building, good ornament, never poses.

In building, as a rule, every departure from the rectangular form is an added expense. One of the things impressed on the mind of a young man who goes into an architect's office to study the profession is that, if cost is to be considered, which it sometimes is and sometimes is not, all excrescences and projections must be avoided. A rectangular house is the cheapest. Bay windows, porches, octagonal or circular external ends to rooms—all these things cost money; and it is by multiplying these features that the expenses of building are often made so great as to deter people from undertaking it, for the things seem so small in themselves, it is not suspected what drains they are on the purse. If a good reason cannot be given for any so-called ornamental feature in a house, if it cannot be shown that something worth while is to be gained by making it, we may be reasonably sure that it is a fancy which will cost, as the country people say, more than it comes to. And, in the greater number of cases, nothing, even in looks, is gained by indulging the fancy.—*Brick Tile and Metal Review.*

A very complete filling for open cracks in floors may be made by thoroughly soaking newspapers in paste made of one pound of flour, three quarts of water, and a tablespoonful of alum, thoroughly boiled and mixed: Make the final mixture about as thick as putty, and it will harden like paiper-mache. This mixture may be used for moulds for various purposes.

Correspondence Special.

BALTIMORE, June 20th.

THE architects in this city are enjoying a harvest of prosperity. Buildings are going up in all directions, many of which are elegant and costly. The style of architecture used is imposing and handsome, without excessive elaboration. I am not a competent critic or would give full description; suffice it to say that there is much work going on, and largely of the better kind.

Knowing you to be a Baltimorean, I thought a line or two of this kind might be acceptable, as coming from the place of your birth—your old home, The changes in the general aspect of the city, its extension in all directions beyond the limits which defined its extent thirty years ago, are wonderful. Truly, progression and advancement is plainly developed in the monumental city. The play-grounds, parks, commons, and barren places of former years have disappeared, and are now covered with houses of all kinds, and still the spread is going on,—all of which bespeaks work for mechanics.

ROBERT.

NEW ORLEANS.

Arrived here all right. Find work very slack. Very little building going on. Journeymen carpenters are working for $9.00 per week and less, and glad to get work at any price. The mechanics of San Francisco should be happy, as I have not found wages so high anywhere, to say nothing of the loss of time on account of the winter and inclement weather. Men who work for so small wages are, however, able to support their families, and, seemingly, live comfortably. Yours truly,

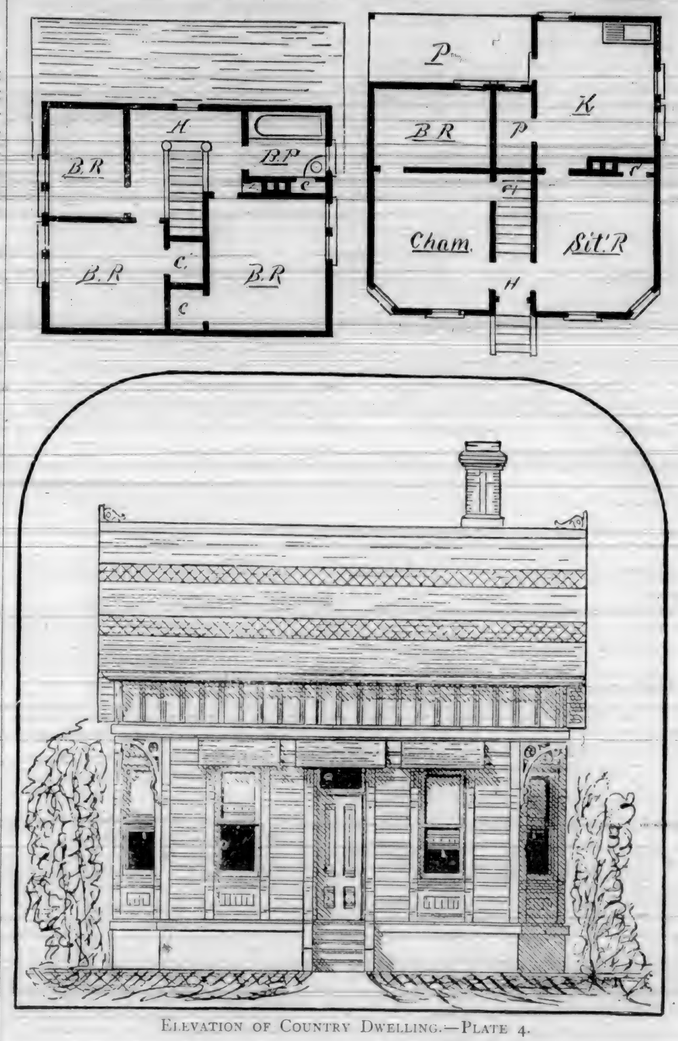
J. F. D.

SAUCELITO, Cal.

MR. EDITOR: Enjoying the luxury of a week's sojourn at this place, permit me to say a word in its behalf. Nearly all the while that I have been here, the weather has been fine, and generally beautiful. There is a stream of life constantly flowing through this berg, and over the railroad to San Rafael, and intermediate places, upon the arrival of each ferry boat. I am surprised at the number of people who live on these hill-sides; the pleasant weather making it manifest by the number of neatly and bewitchingly tidy dressed ladies to be seen in the pathways, and among the trees; this said—enough; for the stearner sex are never far away, where beauty and innocence is found in such happy forms and characters.

The place is improving, several fine homes being in course of erection or in contemplation. One most handsomely and romantically situated upon the brow of the hill, just above the ferry landing, owned by Mr. W. G. Barrett, is very noticeable, and attracts much attention. The view from all parts of the structure is fine, and from the attic story, unsurpassed, commanding a view of the entire bay, and the long range of hills and valleys up to Mount Tamalpais; and southerly, the northern section of San Francisco from Telegraph Hill to Fort Point. With such a home retreat, an owner may well pray for Sundays and holidays to haste around and tarry long, for if rest and comfort cannot be taken there, then nowhere.

I hear of several projecting building improvements in this locality, and, in time, I think that hundreds will wend their way homeward to this place, and perhaps in still later times, cable roads or some other device will be provided to make access up the steep hill-sides easy.



ELEVATION OF COUNTRY DWELLING.—PLATE 4.

California as a manufacturing State now ranks as the 25th. There are 1,000 establishments using power. They use 205 water-wheels, of 4,850 horse-power; 990 boilers, 179 engines, with a power of 28,071 horses, making total steam and water-power in horse-powers, 32,921.

NO MORE SKY HIGH BUILDINGS.—Enterprising and speculative owners are now confined by law to a height of eighty feet as the limit of altitude to be applied in the erection of buildings in New York. No more fifteen story traps.

Reflected Sound in Buildings.

VARIOUS instances are given of the mixture of direct and reflected sounds. In the gallery of the Bourse at Paris the confused vociferation of the multitude below is mentioned by Professor Tyndall, who says, You see all the motions of their lips as well as of their hands and arms; you know they are speaking, but you hear them not. Their voices mix with their echoes into a chaos of noise. It is well known that an audience and furniture both materially deaden the echo. Thus the same authority refers to a lecture delivered in the Senate House of Cambridge, where his voice was not heard at a distant part of the hall. "The assembled audience, however, so broke up and quenched the sonorous waves, that the echoes were practically absent, and my voice was plainly heard in all parts of the Senate House." In St. Alban's Cathedral, the tick of a watch can, it is said, be heard from one end to the other. In Gloucester Cathedral, a gallery of an octagonal form conveys a whisper 75 feet across the nave. The whispering-gallery of St. Paul's is a well-known instance of echoes. The well at Carisbrook Castle in the Isle of Wight, which is 210 feet deep and 12 feet wide, lined with smooth plaster, is a wonderful conveyer of sound; a pin dropped into the well can be distinctly heard. Sound is not only reflected, but is refracted like light, and may be condensed; it can be diffracted or bent round obstacles. Echoes are reflected waves. Echoes may be prevented by cutting off the angles of the room with drapery, by wires stretched across the room to break the waves of sound, and, in fact, by any device which will interrupt the reflection of the sound waves. The method of demonstrating the reflection of sound is by the use of two parabolic reflectors placed opposite each other with their centers in a line; a sounding body is placed in the focus of one of the reflectors, and the sound waves striking the nearest reflector are thrown by reflection to the farthest reflector, and is then concentrated to its own focus, so that an ear placed in this second focus distinctly hears the sound made at the initial point. A vertical wall without break behind the sound and not far removed from its source, resembles a reflector, and is sufficient to cause an echo. Either a recess or a gallery may tend to break this reflection. Unfortunately treatises on sound seldom enter into the question of the means to be taken to remedy echo or promote the transmission of sound in buildings. In large assemblies the principle of the isacoustic curve, one of equal seeing and hearing, appears to give the best results in the arrangement of the seats of the auditors.—*Building News.*

Hand Saws and the Art of Saw Filing. This book gives full information for putting in order all kinds of saws, from a carpenter's panel saw to a steam saw-mill. Illustrated profusely. Price, $1.00.

Building Superintendence. A new work and one that should be in the hands of every architect, contractor, and student. Price, $3.00

Practical Carpentry. As its name indicates, this work presents practical answers to those questions that so frequently vex the mechanic. Price, $1.00.

Competition for Plans for Public Works.

IN quite a number of towns which need water-supply and sewerage the authorities are trying to shift the responsibility of providing a feasible and proper scheme from their own shoulders to those of engineers and contractors, by calling for plans as well as proposals for construction of works, to be submitted in competition. In some cases a moderate sum is named as the prize to be competed for, and in others the franchise of a company is set up as the reward. This method of obtaining plans is not likely to result in benefit to the public. In the first place, civil engineers of experience in water-works or sewerage designing and construction are not likely to enter into such competitions. Their time is valuable to them, and they cannot afford, nor are they willing, to squander their time in investigating and reporting upon projects on the mere chance of getting a small remuneration, although they might be glad to do the work required with an assurance of the compensation. The bidders in such a case are apt to be either inexperienced young men seeking to get their names before the public, or mere speculative engineers who are working with owners of patent methods. As for giving out contracts for works either of water-supply or sewerage, conditioned only on the execution of a trial test when the works are completed, it is an exceedingly risky and unbusinesslike proceeding. No man or firm can be trusted to do thorough work in these lines without constant supervision and inspection by an expert. It will invariably be found cheaper in the end, for those intending to construct such public works, to secure first a plan and specifications from an experienced civil engineer, and then have the work built under inspection from beginning to end.—*Sanitary Engineer.*

Law in Relation to Newspapers.

1. SUBSCRIBERS who do not give express notice to the contrary are considered as wishing to continue their subscriptions.

2. If the subscribers order the discontinuance of their periodicals, the publishers may continue to send them until all arrears are paid.

3. If subscribers neglect to or refuse to take their periodicals from the office to which they have been directed, they are held responsible till they have settled their bill and ordered their paper discontinued.

4. If subscribers move to other places without informing the publisher, and the papers are sent to the former direction, they are held responsible.

5. The courts have decided that refusing to take periodicals from the office, or removing and leaving them uncalled for, is *prima facie* evidence of intentional fraud.

6. Any person who receives a newspaper and makes use of it, whether he has subscribed for it or not, is held in law a subscriber.

7. The postmaster who neglects to give the legal notice of the neglect of a person to take from the office the newspapers addressed to him, is liable to the publisher for the subscription price.

Forest Fires.

IF forest fires keep on destroying the woodlands all through the summer at the same rate as they have done during the past month, there is every indication that the loss incurred in this manner by the national resources will throw every other form of fire losses into the shade. The average citizen takes but little interest in the quantity of buildings and manufacturing establishments that are consumed monthly by fire; this is partly due to indifference, and partly to the knowledge that *his* property is insured; but the interest he takes in forest fires is practically *nil*. Indeed, what does he care whether thousands and thousands of acres of woods are burned? That does not concern him; it is none of his loss. But when an agitation is instituted against the lumbermen to prevent their cutting the trees—ah—that is something entirely different; *that* subject is to him about as clear as stove-blacking, but of course he understands it all, and joins heartily in the wholesale condemnation of these horrid lumbermen who want to rob us of our fine forests. As woods are not insured against fires, there is no collection of statistics to show the annual losses, but if they could be obtained we are fully convinced that the total aggregate would be enormous. What are we going to do about it? Let things go as they have gone, without even an attempt to offer some form of check? We have laws, and fortunately they are enforced, to guard against incendiaries, but our forests are considered universal property, and if by accident or carelessness somebody starts a fire, why, they are only trees, such man thinks, and there is no harm done. How many acres of woodlands are burned up during the dry season ignited by sparks from locomotives? How often is a forest fire started because some mighty hunter did not think it worth his while to put his foot on a piece of burning gun wadding? There are dozens and dozens of conditions where a large conflagration could have been prevented by even a very small amount of care, but nobody takes an interest in it. And where is the law that so effectually protects our other property? Why not have it apply to forests as well? They represent money. It seems that a constant agitation of this subject is necessary to insure the amount of attention that must, as a matter of course, precede the institution of any active measures to prevent the constant waste of our forest resources by destructive fires.

Strangers naturally turn to the advertising columns of a newspaper, as they would to a business directory, to ascertain the commercial standing of the place in point of the number and kinds of interests represented, and they turn to the advertisements in a trade paper to see who is wide awake.

The Great Forests of Puget Sound.

IN Western Washington, between the Cascade Range on the east and the Coast or Olympic Range on the west, and between the 47th and 49th degrees of north latitude, is a thickly timbered belt of fir, cedar, alder, maple and other woods. Of these, fir probably represents three-fourths. In the midst of this wealth of forest, nature has placed a broad, deep arm of the Pacific Ocean—Puget Sound—with which it is connected by the Strait of Fuca. Thus not only has nature provided the timber, but the water-way also by which it is possible for the merchant marine of the world to come and obtain their lumber supplies, much of which, some time in the future, must be furnished from these forests. Already the lumber trade with Australia, Central and South America, China, and the islands of the Pacific, amounts to fully 75,000,000 feet a year, and employs a fleet of about 15 vessels every month.

Puget Sound is 200 miles in length, and has a littoral of 1,800 miles. This irregular shore line forms innumerable harbors, splendidly adapted for the erection of saw-mills and other wood-working factories, and also for the establishment of ship-yards. Along this whole shore line, and from thence on both sides as far as the eye reaches, nothing can be seen but the vast and magnificent wealth of timber, save here and there where man has established a mill port, a town, or an occasional farm. In the timber belt of Western Washington there are 20,000,000 acres covered with timber, most of which is included within the limits named—an area nearly equal to the combined areas of the States of Connecticut, Massachusetts, Vermont, and New Hampshire. This timber belt will average 25,000 feet of lumber to the acre, or a total of 500,000,000,000 feet of lumber. Hence the saw-mills of Puget Sound, with their present capacity of 500,000,000 feet a year, would take 1,000 years to cut it down. The fir trees frequently attain the height of 250 feet, and planks of lumber are sometimes turned out of these mills 100 feet long.

Creosote Wood Stains.

SAMUEL CHABOT, Jr., No. 70 Kilby Street, Boston, is directing the attention of the trade to creosote wood stains which he is manufacturing. These stains take their name from one of their most important ingredients, namely, cresole or creosote, a well-known preservative of vegetable tissues. It is claimed that this substance unites with the albuminous or sappy part of the wood, which is the first to decay, and forms with it a compound which resists all changes from water or the variations of climate. It also protects the wood against the ravages of insects, notably the white ant of the South. These stains are manufactured in a great variety of colors suitable for exterior use, and their effect upon the shingled villas and cottages now so much in vogue is picturesque in the extreme. The manufacturer claims for them several important advantages over oil and chemical paints. First is the fact that they are from one-half to one-fifth as expensive as paint. The effect of paint is to form an air-tight screen over all cracks between clap-boards and shingles, sealing them tightly, thus confining moisture under them and sometimes hastening the decay of the wood. It is urged, on the other hand, that creosote stains form no screen, and permit the ready evaporation of any moisture which may come between the pieces. The manufacturer also directs attention to the superiority of stains over paint from an artistic standpoint. He also calls attention to the fact that, stains being in the wood and not on its surface, the color is not liable to discoloration by cracks or peeling off. The stains also have the advantage of bringing out with beautiful effect the natural grain of the wood. The cheapness of these stains, the manufacturer states, combined with their great preserving quality, recommends them for priming wood before painting. Painting can be readily applied over the stains after they have been allowed to dry.

Master Carpenters.

AN article appearing in the June number of this Journal, in reference to the movements of the master carpenters in San Francisco, has attracted considerable notice and comment from Eastern journals. The following from a St. Louis contemporary, who, doubtless, appreciates the facts given in the article referred to, without the courtesy of acknowledgment, publishes the following:—

"The master carpenters of San Francisco have joined together and formed an association, for the better protection of what they honestly believe to be their rights. They consider the practice, prevalent among owners, of buying building material without calling the contractors into the transaction, to be a violation of the spirit of their contract, wherein it is, or should be, understood that the benefits of all discounts on material rightfully belongs to those who have the responsibility of putting it together. A tailor or shoemaker would be greatly astonished by the request of his customer to exercise the privilege of buying the material for a pair of pants or boots, but when lumber, brick, or glass presents such a profitable field for speculation, the love of the owner for the mighty dollar is too strong to allow of technicalities in principle to stand in the way of his saving it. In case of risks or accidents the contractor is generally found to be the under dog in the matter, and is soundly berated if the specifications are not complied with. The "Baltimore Resolutions" of the plumbers is a model of protection to the interests of the master mechanic, and they are all gradually recognizing the fact that a resolution of some kind will soon become necessary to keep them in fresh bread and butter. The master carpenters of St. Louis could kick each other awake to many abuses they are subject to, and follow the example of their brethren in San Francisco in resolving what shall be, instead of quietly talking of what should be."

Health Officer Wight of Detroit, Mich., is making war on the ice-dealers who cut ice below the city, where it is claimed the water is contaminated by the sewerage. He has asked the Common Council to enact an ordinance to prohibit the sale of ice cut below Belle Isle, an island in the Detroit River above the city. The aldermen and councilmen have made the tour of the inlets and bays up and down the river where ice is cut in the winter season, obtained samples of the water for analysis, and propose to co-operate with the health officer if it can be found that his position is tenable. The question has brought up a discussion between the doctors as to whether the water is filled with bacteria, one faction claiming it is not, while the other takes the opposite ground. The ice-dealers, who see a possibility of their winter harvest-ground being cut off, are taking a prominent part in the agitation. Health Officer Wight has also been doing good work in the way of fumigating the sewers, having burned 1,090 pounds of brimstone for this purpose.

Always Pay and Save Money.

THE publisher of the *East Oregonian* had a subscriber who repudiated $1.56, claimed to be due for the paper. The delinquent was saucy and the newspaper men got upon their mettle and sued the aforesaid delinquent. The case was fought by nine lawyers for the defense and two for the prosecution. The plaintiffs got a verdict for the amount claimed, and the defendant had to foot a cost bill amounting to $74, besides the fees of nine lawyers. The moral of this case is that those indebted to newspapers for subscription will find it more economical to call and settle than to attempt repudiation.—*Ex.*

THE DECORATOR AND FURNISHER, published in New York, is a most excellent journal, always full of interesting matter and illustrations. Its June number is specially interesting, containing a description of a Long Island home, with illustration views, an exhaustive and pleasantly written description of modern iron work, with general examples, reference to the art work of the Society of Associated Artists, and some admirable designs for ladies' home work, crazy quilts, plaques, etc.; also practical designs for easels, bedsteads, dressing cases, wardrobes, picture frames, sideboards, etc., and much of interest of artistic and literary value. Those desiring can order same through this office.

The reel of wire rope for the St. Louis, Cable Road is said to be the largest in the world. It weighs 89,510 pounds, and was shipped from Trenton, N. J., on a car weighing 35,000 pounds on sixteen wheels.

INFLUENCE OF DECAYING WOOD ON HEALTH.

It is generally admitted that the vicinity of large quantities of decaying wood is dangerous to health, but the evidence as to this is scanty, and by no means definite, nor have we anything but more or less probable theories as to how disease is produced in this way. Yellow fever, typhoid fever, and various forms of malarial fever have been attributed to his cause—not that rotting wood is supposed to be alone sufficient to produce them, but that their specific causes seem to flourish and increase when introduced where it is present in large quantities.

It is a fact that, in a number of instances, the prevalence of yellow fever in epidemic form has been connected with the presence of decaying timber in or beneath piers and wharves, or of masses of rotting shavings, chips, sawdust, etc. This was the case in Providence, Baltimore, New York City, and Norfolk, and the presence of rotten timbers or planking in yellow-fever ships has been noted so often that by many it is thought to be something more than a mere coincidence.

Collections of damp and decaying sawdust have been in a number of instances charged with the production of malarial disease, and in some of the Northwestern States, and especially in Michigan, the evils from this cause have been the subject of discussion by sanitary officials.

Decaying wood pavements or sidewalks have been suspected of causing malarial affections in Memphis, in Washington, and elsewhere, although the relation between cause and effect does not seem to have been clearly established.

We do know, however, that green wood contains a very considerable amount of albuminoid matter, which affords food to microorganisms which decompose it, producing phenomena of putrefaction and giving rise to more or less offensive odors.

Professor Brewer, of New Haven, has reported the results of a number of experiments on the results of soaking green wood of various kinds in cold water, and thus removing the albuminoid matters. That green lumber contains something which greatly favors its decay, and which may be removed by long-continued soaking in water, was well known many years ago, and gave rise to the process of water-seasoning, in which the planks were sunk in large bodies of water and kept immersed for from six months to a year, when they were raised, piled in the air, and thoroughly dried. Flooring lumber thus treated is little liable to decay, for the simple reason that it contains little or nothing that is fit for the food of the micro-organisms and fungi that cause decay. The albuminoid material which may be thus extracted from wood appears to support the life of various micro-organisms which, so far as we know, are not directly or indirectly injurious to health. We can only infer that it will also support the life of other organisms which may be injurious—the germs of specific disease—and conclude that it is sufficiently probable that this is the case, to warrant the giving special attention to this subject in investigations as to the causes of the local prevalence of certain diseases.—*Sanitary Engineer.*

Trees and Rainfall.

In the official report of the geological survey of Wisconsin is an account of the determinations made by Dr. J. M. Anders, of the amount of water pumped from the earth by trees. He finds that the average exhalation from soft thin-leaved plants in clear weather amounts to about one and a quarter ounces troy, per day of twelve hours, for every square foot of surface. Hence a moderate sized elm raises, and throws off seven and three quarters tons of water per day. In the report the facts are applied to what is going on in America, where certain inland fertile districts are becoming converted into deserts by wholesale clearings, and in other places, such as the plains of Colorado, where five or six years of irrigation and planting have already produced a measurable increase of rainfall. It is maintained that the deserts of Syria and Africa are the results of cutting down trees, and that original luxuriance may be restored by skillful replanting.—*Chicago Times.*

On a recent trial a cedar log twenty feet long was taken to a California match factory, and in exactly twenty minutes was sawed, split, glued, dipped in sulphur, labelled and the matches boxed ready for shipment. [The above is a good story to tell, but if the "log" was more than a few inches square measurement, and twenty feet long, no such feat was ever performed. For the purpose of an item, a piece of 2x6, twenty feet long, might have been called a "log."—Ed.]

"EASTLAKE."

Indestructible Gloss Paint.

Easy-working, durable, economical. Especially adapted to the climate of California. This article is a welcome improvement on the pigments employed in modern house painting, and takes precedence of the lead, oil, and turpentine composition at present in use by the paint trade. It is particularly valuable to painters and property owners, who, by securing the SEALED CANS OF EASTLAKE PAINT, have thereby a guarantee that they are having a genuine article, free from adulteration, guaranteed not to contain gum, rosin, benzine, or turpentine, but a compound made of pure lead, zinc, and oil only, with a chemical solution THAT RENDERS THE PAINT, WHEN SPREAD, HARD AND GLOSSY, alike resisting the action of fog and heat, without oxidizing or chalking, as is so frequently the case in California.

In White and all shades, Sample Color Cards and Price List of which will be furnished on application to Eastlake Paint Co., Oil and Color Grinders, No. 199 South First Street, San Jose, Cal.

MASONS' AND BUILDERS' EXCHANGE
OF SAN FRANCISCO
Room 11, 314 Montgomery St.

Below will be found a list of the members composing this Exchange. Boxes are provided for each member, so that architects, owners, or others desiring the services of any particular member, or those having boxes who are not members, and yet whose business is directly connected with that of the Exchange, can readily secure the attendance of the party sought, by leaving a note in the respective boxes.

JOSSON'S PORTLAND CEMENT.

This renowned brand of cement has been extensively used on the continent of Europe for a long time past and has always given entire satisfaction.

In Paris, Lyons, Marseilles, Brussels, and other large towns there are coatings of this cement applied about 30 years ago, which to-day appear as of recent date.

Messrs. Josson & Co. guarantee their cement equal to the quality of the best English brands. Josson's cement is highly endorsed by

A. ENGELS, Engineer of the New City Hall, Brussels;
C. ALMAIN HASE, Architect, Brussels;
ROBERT ERCH, Civil Engineer of Hydraulic Works, Antwerp;
F. Le CARLIER, Engineer of the Cockerill Docks, Hoboken;
GEO. D. GREEN, Dr., Civil Engineer of Dep't of Docks, New York;
W. W. MACKLAY, Engineer of Dep't of Docks, New York;
And Many Others.

Building Report for August, 1885.

As shown by the itemized statement elsewhere given, the number of building, alteration, and repair engag ments reported since last issue is as follows:—

August, 1885,	83,	with total cost of $347,600
July,	99	" " " " 412,050

These figures show a shortage in August as against July, of $64,450. But the July report included a single brick warehouse costing $70,000 for specially private purposes, located outside of the more active business center, and although a factor in the total of building operations within the city, it may consistently be excepted from the general list, which would place August, 1885, $5,550 ahead of July. Again, the report for August, 1884, made the amount of building investments for that month 83, at a total cost of $635,411, a difference of $287,811 in favor of August, 1884; but in that amount was included the Murphy Building, at $300,000. Consequently if the cost of this *one* building is deducted from the total of $635,411, the balance in favor of August, 1885, will be $14,189. All of which goes to show that the general building prosperities, outside of special large jobs, continue unabated.

The oldest paper in the world, the Pekin *Gazette*, has lately taken a new lease of life. The venerable journal, alone almost in a changeless land, has changed its form. Established in the year 911, the Pekin *Gazette* has been published regularly since 1351. Under the new arrangement three editions are published: the first, the *King-Paou*, printed upon yellow paper, constitutes the official gazette of the Middle Kingdom; the second, the *Hsing-Paou* (commercial journal), also printed upon yellow sheets, contains information interesting to the trading community; while the third, the *Titani-Paou* (provincial gazette), printed upon red paper, consists of extracts from the other two editions. The total circulation of the three is 15,000 copies. The editorship is confided to a committee of six members of the Academy of Han Lin.

The Future in Building Operations in San Francisco.

The deep interest and concern felt in the building prospects of the future, are clearly manifest in the earnestness with which inquiry is made by owners, material men, and building mechanics generally, for the purpose of finding facts, theories, and arguments upon which to base conclusions as to the probabilities, and settle and solve the material question of degree of future decline or prosperity in building activities. There has been so prolonged a period of "good times" that a foreboding comes to many that, in the natural order of things, there must be a letting up;—a resting time to permit the equalization of demand and supply.

Owners are anxious for light upon the subject, many being willing, and having the means to improve, yet fearing that "the thing has been overdone;" and material men are eager to learn, so as to be able to judge correctly the facts most likely of realization in the disposal of materials, so as to regulate supplies, and avoid the involvments of overproduction: and mechanics most naturally are anxious, as upon the quantity and permanency of employment depends, with them, the daily support and comforts of themselves and loved ones.

To all this there can be no reliable answer or assurance given. It is not within the reach of human wisdom to reveal the hidden mysteries of the future, nor to foretell the things that are to come to pass. But it is within the province of human speculation and judgment to determine the probabilities, and from the advantages of practical experiences and familiarity with the facts of the past, and a fair understanding of the present, to arrive at conclusions most likely to be realized.

The song of the "croakers" is, "Too many houses, too much building, and erelong there will be a tumble so mighty, and a fall so terrible, that thousands will be crushed beneath the great avalanche that is sure to come." But this sort of music has been sung so long, and by voices so cranky and unmelodious, that the strains have become discordant and inharmonious: and while these dull sounds have been echoing, the more sensible, enterprising, and progressive people have gone on—built and rented, and are reaping the golden harvest that renting to good-paying tenants yields.

An abatement in the great rush of building which placed the investments of the first six months of 1885, $1,267,889 ahead of any like period in San Francisco's history, so far as shown by any authentic record, was to be expected, and should be received as one of the

natural and reasonable outcomes of a *too universal eagerness* among lot owners to take advantage of the low price of materials, and avail themselves of the many inducements to improve vacant lots. There is a proper limit for everything, and when the boundaries are overstepped, the fields of excesses are reached, and those who enter therein must necessarily become discouraged, as nothing fictitious in life affords permanent satisfaction, particularly when it reaches the pocket and purse. It is mainly in this direction that the shrinkage manifests itself, and not in the erection of buildings for homestead purposes, there being a large number of the latter at present in contemplation; and it is not only fair to presume, but a fact certain to be realized, that many fine residences will be commenced before the end of 1885.

Consequently there is good encouragement for those interested in building operations, with scarce a doubt that good mechanics in all the branches of house building will find continued employment, which also means fair trade and transaction for dealers in all kinds of building materials. And with the fact in view that there is but slight decline in rent rates, and this only in houses built years ago, and lacking in many respects the better and more modern improvements in house fittings, particularly in sanitary appointments, there is no occasion for owners to fear that houses conveniently arranged, and built to suit the popular demand, will suffer long for want of satisfactory occupants.

Angelo and the Cardinal.

UNDER the papacy of Julius III., the faction of Michael Angelo's rival, San Gallo, gave him some trouble respecting the building of St. Peter's, and went so far as to prevail on the pope to appoint a committee to examine the fabric.

Julius told him that a particular part of the church was dark. "Who told you that, holy father?" replied the artist. "I did," said Cardinal Marcello.

"Your eminence should consider, then," said Michael Angelo, "that besides the window there is at present, I intend to have three more in the ceiling of the church." "You did not tell me so," replied the cardinal. "No indeed I did not, sir," answered the artist; "I am not obliged to do it and I would never consent to be obliged to tell your eminence, or any person whomsoever, anything concerning it. Your business is to see that money is plenty at Rome; that there are no thieves there; to let me alone; and to permit me to go on with my plan as I please."

"Ah my little man, good-morning," pleasantly remarked an old gentleman as he stopped and patted a Hewes Street little boy on the head, "have you any brothers and sisters?" "Yes, sir; got four, but I'm the only one that 'mounts to anything," replied the urchin.

Cumming's Details..... $6.00

St. Peter's, at Rome, is situated on the ancient site of the circus and garden of Nero, where that tyrant massacred numbers of Christian martyrs. Tradition says that the bodies of these martyrs were buried by their faithful friends in a grotto near the circus, and that among those who were thus buried here was the crucified apostle, St. Peter.

In 306, Constantine founded a church over the reputed grave of the holy apostle. This edifice remained eleven centuries, when Pope Nicholas V., in 1450, demolished it, and laid the foundation for the present St. Peter's. At the death of this pope, the structure had been elevated only four or five feet above the pavement. The work was suspended, or made but little progress, till the time of Julius II., who, in 1503, employed the celebrated Bramante to carry on this great undertaking.

This architect formed the original plan of the cupola, and caused four stupendous pillars or piers, two hundred and nine feet in circumference, to be raised to support it. The patron and the architect both died and left it in this state.

Leo X. employed architects to carry on the work, among whom was the celebrated painter Raphael d' Urbino, who strengthened the basis of the pillars, which he deemed too weak to support the stupendous cupola.

Various other architects were employed by the pontiffs who succeeded Leo, until, at last, Paul III. committed the edifice to the incomparable genius of Michael Angelo Buonarroti, who designed the dome and cupola as they now stand. He wished to make the front like the pantheon, but death removed him from his labors, and the sublime idea was abandoned. Michael Angelo "left it an unfinished monument of his proud, towering, gigantic powers; and his awful genius" seemed to watch over his successors for a long time.

Many other artists were employed upon this stupendous edifice, until it was finished, under Paul V., by Carlo Maderno. Three centuries and a half this church was being built; and, in 1694, the cost was estimated to have been eleven million pounds sterling, or about forty-nine million eight hundred and forty thousand dollars.

This edifice contains the best specimens of designs of the ablest architects who flourished during a period in which the revived classic style was carried to the highest perfection which it reached in Italy. The extreme length of St. Peter's is seven hundred and twenty feet; breadth, five hundred and ten feet; height, from pavement to the top of the cross upon the cupola, five hundred feet.

Laborers are not anywhere a unit on reform measures. In Austria they are protesting against the reduction of the hours of labor from fourteen and twelve to eleven; to the law forbidding women and children from performing the severer parts of work, and they object to a Sunday holiday. If so, such slavery to toil should all the more be checked by Government interference.

Los Angeles.

Its Building Interests.—The accompanying facts and figures, while specially interesting to the firm of Kysor & Morgan, architects, also possess common interest to the inhabitants of that section of country generally, and correlatively, to the people of the entire State of California.

The firm above named reports that during the years 1883-84, the buildings planned and superintended by them aggregated a total cost of $1,687,000.

Buildings Just Completed.—The Sisters of Charity Hospital, $80,000; residence, Jasper Harrel, $34,000; Davies-Henderson Lumber Company's Building, $15,000; Roder Block, $9,000.

Under Way.—Residence, H. D. Barrows, $5,500; Gilmore building, Fred Gilmore, $8,500; res., H. C. Witmer, $7,500; res., R. Mercer, $2,000; res., Niles Pease, $4,000; cottage, Mrs. Eberly, $1,500; res., A. Clark, $4,500; addition to Capitol Mills Warehouse, $17,000; winery and distillery, B. Dryfus, Anaheim, $35,000.

Prospective Work.—Brick building, J. Bryson, $45,000 to $60,000; E. Germain, $30,000; one of $75,000; one of $22,000; residence, J. B. Lankershim, $15,000, with $7,000 added for outside improvements, stable, etc.; res., Dr. W. F. Edgar, 44x82 ft.; res., J. L. Sheward, $8,000; improvements to res., O. W. Childes, $8,000 to $10,000; res., John Brewer, $2,000; res., H. L. Drew, $10,000.

This is a very splendid business showing for a single firm of architects in a city somewhat remote from the great through line of travel and the center of commercial intercourse. If to this is added the amount of building values controlled by the several other resident architects at Los Angeles, and those handled by architects from San Francisco, the aggregate would be large, and serve to establish the fact that the county of orange groves and vineyards has and is enjoying a full share of the general prosperity which has been experienced throughout the State of California since 1880.

No better evidence of advancement and prosperity can be found in any city or section of country, than the erection of large numbers of substantial dwelling-places, from the unpretentious cottage sheltering the toiling workers and their loved ones, to more magnificent residences—perchance mansion-like in proportions and appointments, where wealth brings luxury and ease, if not the more-to-be desired and sweeter comforts which make life joyous and happy among those whose great treasure is contentment. All these proclaim growth and advancement, for men of mind and purpose build not as hermits,—alone in solitude, estranged, shut out from fellow-kind, lost to all aims, ambitions, emotions, and endearments worthy of noble manhood.

But private residences speak of more; they are not found clustered in barren wastes, nor sandy deserts, but in localities and places where

active business centers, and men by trade, commerce, mechanical, agricultural, viniculturual or other pursuits, gain riches and become more or less wealthy, and of necessity stores, business constructions, public buildings and edifices of greater or less extent and character must exist, to accommodate the ever moving and ceaseless demands of trade and traffic, all tending in the one direction, to enrich and make happy the thousands who mingle in the general interest.

In addition to all this, Los Angeles has gained an enviable and almost world-wide reputation for its salubrity of climate, fertility of soil, luxuriousness of orange groves, vineyards, orchard and field productions, and is destined to assume a rank of great importance among the cities of California. If the rapid advance made within the past three or four years continues, with no relaxing of energy and enterprise on the part of the inhabitants and interested parties, the next ensuing decade will record a growth and prosperity for Los Angeles of very great proportions. How great, as compared with the other cities of California outside of San Francisco, we shall not attempt to predict, leaving that to be developed by the evolutions of time and circumstances, and the efforts, energies, and enterprises of the people of the respective places. Nature has furnished the groundwork of greatness; it therefore remains with those who possess and occupy the land, to utilize and improve the special advantages and opportunities so abundantly strewn around them.

Los Angeles—Continued.

THE reports from which we gather the items herewith accompanying are lengthy, giving, in detail, the sizes, style, and general description of the buildings mentioned. This it would be impossible for us to do without sacrifice of other matter of more general interest. Consequently we simply state the prominent facts—owner, architects, and cost. As described, some at least of the edifices named are or are to be very nice affairs, and would be creditable to any street in San Francisco, if erected in this city.

Messrs. Boring & Haas, architects, report in course of construction a thirty-five room addition to Long Beach Hotel, at a cost of $10,000; also cottages for Long Beach Co., $7,000.

MOTT MARKET BUILDING, 62x128, cost not stated.

THE UNIVERSITY OF SOUTHERN CALIFORNIA, on which work was stopped for want of funds, is about to move on again toward completion, money in part having been raised for that purpose.

MOTT & SPENCE BUILDING, brick structure with stone facings, $24,000.

COTTAGE for Mr. D. E. Thompson, $3,000.

A SCHOOL BUILDING for Prof. D. W. Hanna's college, $2,000.

Among the buildings to be erected by the same firm is a $30,000 sanitarium; a residence for Mr. L. Stuart, $7,000; a residence for Mrs. M. A. Hoadley, $6,000; residence, F. Morrison, a wealthy ranchman, 75x50 feet, cost not stated.

All of which, together with other improvements noticed, show a very considerable degree of building activities in and around the city of Los Angeles. We are pleased to learn that our professional brethren in the localities named are "so busy," and hope that the shadows of their professional success may never grow less.

San Diego—Good Showing.

A COPY of the San Diego *Union*, of June 17th, containing a nearly two-column statement of building improvements in that city, was duly received but accidentally mislaid; and being favorably disposed toward the most southern metropolis of the State, through the courtesy of Mr. J. A. Kooken, a second copy was obtained, from which we gather the fact that the number of buildings erected in the recent past, now under way, and positively to be built, together with a few alterations and repair jobs, number about eighty-five, with a total expenditure of nearly $289,000, including in the number some very nice residences, in cost ranging from $2,500 to $15,000.

Although San Diego is the tip of the south wing of the State of California, the foregoing facts and figures show a pleasing degree of prosperity, which, while not so large in volume as other places nearer the great central business mart of the State, it should be, all things considered, decidedly gratifying to the people of that section. A community of people enjoying all that can be desired in salubrity and healthfulness of climate, fertility and fruitfulness of soil, beauty of harbor, and almost every natural, local advantage for life, health, and comfort, must in time reap the rich harvest that ever flows in such channels. To bring about more brilliant results quickly, will require indomitable energy, persistent effort, and a determination upon the part of all concerned, particularly the "leading men,"—those who direct and control public sentiment, and lay out the work necessary to be done. The common and general interests of San Diego, perhaps, require the presence and co-operation of one or more specially qualified men, with grasp of intellect, foresight, judgment, and every other quality of mind and heart necessary to handle and solve all present problems as to the future best good of San Deigo, and give vitality to movements that will for the present modify, and finally overcome the disadvantages which have thus far held the destinies of the place in check.

The people of San Diego, and of every city, town, village, and hamlet, and of the whole country, should ever remember that the entire nation was at a time shrouded in gloom, no one being found "sufficient" to break the bands of almost universal despair, until the immortal hero for whom the nation yet mourns rose *equal to the occasion*, and rolled back the deluge that threatened to engulf the nation's life and liberties. So in communities, with the right man in the right place, laying siege to all obstacles, victory is sure to follow.

DULL TIMES EAST.—Nearly every one of our Eastern exchanges makes reference to the "prevailing dull times," some predicting a continuance and increase of the stringencies, while others take a more cheerful view of the situation, and claim that encouraging signs of business revivals are apparent, generally. In support of this, statements are made that certain manufacturing establishments are enlarging and preparing for full capacity operations, and that the near future will witness a return of brisk times. It is to be hoped that the better condition of things will be realized, and that the tens of thousands of wage earners who have been out of employment will soon return to their places and find steady and constant work.

In California, there has been no such labor panic as is and has been reported to exist in the Eastern States. And had not the dullness in other sections of the country "driven" thousands of workers to this coast, the supply of labor here would at no time have exceeded the demand; and, even with this influx added, the good and competent men have, generally, found steady employment, the idle ones being mainly of the class first laid off, when pressing necessities for their services do not exist,—to all of which the fact may be added that the cutting of wages on this coast has been less than elsewhere, and the pay maintained, averaging greater than in any other well settled section of the country. But it may be further added, by way of caution, that mechanics who come hither must expect to take their chances in finding employment, as all labor avenues are full—some to overflowing.

Sub-Letting Plumbing Work.

The feeling continues to grow against the practice so fatal in its consequences, of master plumbers sub-letting contracts to irresponsible parties. The Minnesota Architectural Association last winter took strong ground upon this important subject, and the associations of other States, as well as several chapters of the American Architects' Institute, have since taken the matter up and added their protests. The "skin" plumber, or, more properly speaking, his employer, is responsible for much of the sickness and death so prevalent in all cities. "Cheap and nasty" may do for the contractor, but it is financial ruin if not death to the property-owner. In time, perhaps, the botch plumber, the botch bricklayer, and the botches of all other trades will be relegated to their proper places, and then will come the era of prosperity for good, honest, conscientious mechanics.

Prices of Building Materials.

THE condition of the material market having much to do with building activities, and the question being continually asked by those contemplating improvements, in general terms we reply, All kinds of materials are low. Lumber is being sold at exceedingly seductive rates, and bricks are much below former prices, while all other lines of materials are in sympathy with the "dull times" so frequently quoted, and the demand for cheapness.

The cry of "dull times" in California is an anomaly; for while the talk runs in that direction, there are but few who are not doing well, and thousands have money to invest in projects assuring fair returns.

BUILDING LABOR.

The supply of workers in all the branches is fully up to the demand, and in some the supply is in excess; consequently the rates of wages at present are considerably below those ruling two years ago. So that those who wait for more favorable advantages, will need to pray for a return of the Dennis-Kearney period, when workers were glad to find employment at any price, and but few ventured to break the sod on their real estate, for building purposes.

EMPTY HOUSES.

The return of absentees from the Springs, summer vacations, etc., is manifesting itself by the decrease noticeable in the number of "to let" signs on houses to rent; and it is fair to presume that by the end of the summer months, and the return of those who have been off on tours of travel or pleasure, but few empty houses will be found in San Francisco, and these will be the less desirable, old fashioned, "too large," poorly arranged, and undesirable places. The fact is not sufficiently considered in this connection, by those who argue that there "are a great many empty houses;" that the old time, out-of-date buildings are apt to go begging for occupants, while acceptable buildings on the same lots would find ready tenants. Under the general conditions of the times, renters are not willing to occupy houses built many years ago, which are so much inferior in so many respects to those of later construction containing so many more conveniences and modern improvements. Still, in the general count of unoccupied buildings, the merest shanty, with from one to ten "to let" signs posted on its portals, front, and fences, swells the aggregate as much as though displayed on a first-class tenement. This class of houses is somewhat analogous to spavined horses—not in demand; nobody wants them unless they can be had very cheap. Take away all this kind, and there would not be a sufficiency of houses to rent in San Francisco to supply the demand.

A Cubic Inch of Gold.

ONE cubic inch of gold is worth $210; one cubic foot, $312,380, and one cubic yard, $9,796,762 (counting the ounce at $18).—*Jeweler's Circular.*

Sidewalks.

IN all large cities—as a rule—other than San Francisco, the sidewalks are laid of material more durable than wood—brick, natural or "patent" stone, asphaltum, and other similar materials, consequently a reference to sidewalks laid of wood would seem strange to those of our readers who have never seen anything of this sort on the public streets. Nevertheless it is a fact that many scores of miles of wood sidewalk are still in use in San Francisco, although on nearly all the principal business thoroughfares they have been replaced—mainly by the "patent" or artificial stone pavement, and in the residence portions of the city, the same process of substitution is rapidly going on. In nine-ten out of every twenty cases of good class, new buildings, whether erected for personal use or renting, stone sidewalks are adopted.

The reasons why this is done are several,—appearance—"looks"—perhaps, being the first, for they do most certainly add greatly to general effect, and give tone and character to the improvement. Besides this, owners understand the fact that while the stone sidewalk is more expensive in first cost, the additional outlay over wood is fully compensated by increased durability, to say nothing of the greater satisfaction and comfort enjoyed. But the most essential feature and quality of impermeable sidewalks, is sanitation. Any sidewalk material that absorbs and holds moisture should be rejected and condemned from sanitary considerations; and in this particular, there is nothing worse than wood, not even the exposed ground and gravel; for the moisture taken in and stored beneath the planking is detained from contact with the pure atmosphere and the process of rapid evaporation, and remains to decompose, and be drawn out by exhilation by the forces operating under the natural laws of sunbeams, and the warmer free air above, in a vitiated condition; while the impermeable pathways resist absorbtion, and retain on their surface or quickly shed all fluids and liquids until they are disposed of by the forces acting upon them, without deterioration or prejudice to healthful conditions.

Pressed wood the best. But so long as wood sidewalks are permitted they should in all cases be laid of dressed or surfaced lumber, for the reason that, in the surfacing process, the lumber passes under a certain degree of pressure, which compresses the wood greatly, besides the solidifying effect of the planer, and the fact is well understood that all kinds of wood and fibrous materials are made more solid, tougher, and consequently more durable, by and according to the degree of pressure to which they are subjected.

Dressed sidewalks the cheaper. The cost of surfacing should not be considered, as those that are so treated last and wear much longer and better, to say nothing of the greater satisfaction afforded in their use; and the smoother surfaces shed the water more readily with less absorbtion, thereby removing, to some extent, the objectionable features of wood sidewalks.

Contracts as a Whole, or Segregated.

AN abuse which of late years has grown into troublesome proportions is that of letting building contracts in the lump to some one person or firm, who are held responsible for the completion of the work in all particulars according to specifications. The contractor sub-lets the various portions of the work to others, each making a specialty of some particular portion thereof, and each responsible to the general contractor. First comes the excavator, then the stone-mason, then the iron founder, then the stone-cutter, then the carpenter, then the bricklayer, then the roofer, then the plasterer, then the glazier, and finally the painter. The pay of each depends upon the thoroughness of the work performed by those who precede him. For instance, the painter having completed his work—an event for which all the others have patiently waited—it is discovered that the mason, the bricklayer, the carpenter, or some one else has either skimped, jerried, or otherwise shirked the details of his part of the contract, whereupon the owner, the architect, and the original contractor confer in regard to the matter. Such conference may continue for a day or for a month, and end in the acceptance of the job or disagreement; but all the time the subcontractors who did their work well are compelled to wait for their pay, and in many instances their workmen also are put off, thereby entailing suffering upon their families. The system is all wrong, and the sooner it is reformed the better. Let the owner award the separate contracts himself, and settle with each contractor upon completion of his portion of the work. Then, if a hitch occurs, the innocent will not have to suffer for the guilty. Let exact justice be done to all, without favoritism or unnecessary delay. These hints are thrown out because the frequent and bitter complaints we hear from all sub-contractors and journeymen, and we hope that those in a position to rectify the evil will lose no time in taking proper action.—*Western Architect and Builder.*

Experienced lumbermen have always held that timber cut in the spring was not durable for building purposes. Recent scientific investigations sustain this belief. It is shown that the richer the wood is in phosphoric acid and potassium, the more likely it is to rot and mould; wood cut in the spring contains eight times as much of the former and five times as much of the latter as when cut in the winter.

"**What a wonderful thing the electric light** is!" "Yes, it is wonderful. I expect after a while it will be used to make the crops grow, instead of the sun." "There are some crops now that thrive by electric light." "Nonsense." "No nonsense about it. There are lots of young men who sow most of their wild oats by the electric light."

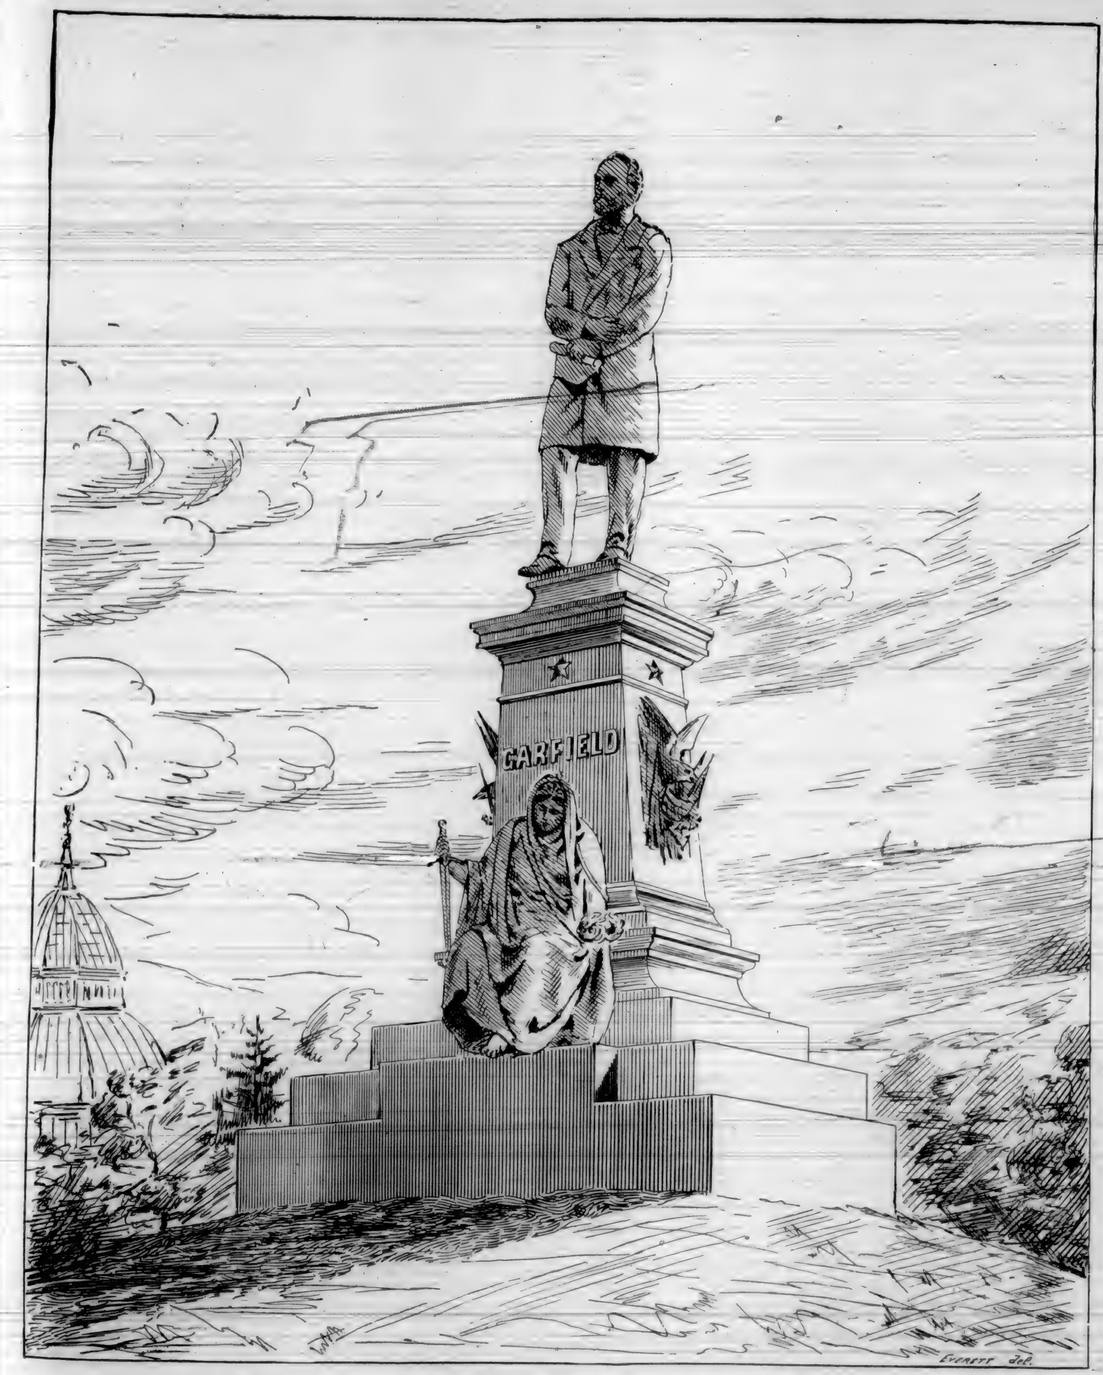

PLATE I.—THE GARFIELD MONUMENT.

Plumbers' Movement.

THE essence of the plumbers' movements, which has, perhaps, attracted more attention for the past two years than any other effort to advance the interests of sanitary science, is well stated by President Allison, of the national association, in a recent interview. He says: "Our objects are simply to inspire and elevate the plumber and the public into a realizing sense of their duties with reference to correct sanitation, and, in order to accomplish them, we require education for both and legislation. The work is necessarily slow. Our difficulties were first to interest the plumbers as a class, and to convince them that, being held responsible by the public for all sanitary evils of bad plumbing (although the fault might lie with architects, builders, and owners), they should make themselves acquainted with sanitary science and capable of shouldering the responsibility. Ignorance, custom, and necessity are the elements we have had to overcome, but we are succeeding, and begin to show signs of a defined purpose and combined unity of action. First, we have sought to smooth away the angularities arising from unworthy competition among ourselves and to arrange the relations between plumbers and manufacturers on a system more just and permanent. This last was covered by what are known as the Baltimore resolutions, which the National Plumbers' Association has confirmed and all but two or three of the manufacturers have assented to. The resolutions requested manufacturers to discontinue the practice of selling material to consumers, whereby injustice to the plumber and increasing confusion were wrought. The architects and doctors have accepted the situation and will co-operate with any reasonable measures to advance the sanitary welfare of cities. The parties who alone are responsible for the plumbing work should also have the planning of it. Correct sanitation includes the construction of boards of health, which, in many cities, seem constituted with the express view to their inefficiency. All of these things require judicious building and sanitary laws defining a standard of ability for the master plumbers. It is upon these points physicians and architects are with us, and we are growing more sanguine of success every year. The meeting at St. Louis, in the number, intelligence, and earnestness of its members, is proof positive, and the reception of our fellow-craftsmen, assisted by the municipal and distinguished servants, backed by the unequivocal and lavish favor of the press, amounted to an ovation. It shows how deep an interest will be taken in any movement to secure public health by improved sanitary regulations when the object and its methods come to be realized more generally. The tone and spirit of the discussions, the learning and earnestness of the essays read, and the high character and superior intelligence displayed by the representatives from all parts of the Union, would do credit to any body of men.—*Sanitary News.*

Death of Mr. Joseph Gosling.

SINCE the last issue of this journal, Mr. Gosling, a well-known practicing architect in San Francisco, has passed away. He was among the early arrivals in this State, and a member of the "Pioneers' Association." During the Virginia City excitement he left San Francisco to join in the general rush of fortune-seekers in that section of country, prior to which he occupied his time as master builder in this city; but finding an opportunity at Virginia City to practice the profession of architect, he did so, and in time returned to San Francisco—twenty years ago, more or less—where he remained and enjoyed a fair degree of professional practice.

San Francisco Chapter.

THE regular meeting of the chapter was held August 7th, President Laver occupying the chair. A goodly representation of the membership were present, all of whom manifested a deep interest in the chapter work. Reports from the various committees were received and acted upon; discussions upon that relating to apprenticeship indentures occupying the greater part of the evening, and after a free and kindly expression of views by all present, the report was referred back to the committee for the purpose of legal advice, and to harmonize the various suggestions made.

Owing to the time occupied in other matters, discussion on the "Lien Law" was deferred until the next meeting of the chapter. The by-laws requiring the nomination of officers to be made in August of each year, either by open nomination, or through a nominating committee, a committee of five, consisting of Messrs. Gash, Macy, Whittemore, Sanders, and Eisen, was appointed, to report at a special meeting to be held Friday evening, 21st inst., to which time the chapter adjourned.

Mechanics' Fair.

THE arrangements that are being made by the management indicate that the coming exposition will be one of more than usual interest. This is to be expected, as the gentlemen in charge have had years of experience and should be in every way qualified to develop many new and specially interesting features—those which go far to win public approval, and make the exhibition a decided success, not only financially but in instruction and profit to the tens of thousands of visitors, old and young, who day and night will throng its broad aisles for pleasure, or to gain the knowledge imparted by the many displays that will be made in beautiful and useful things, and the numerous mechanical contrivances and devices, and the exhibition of art, sculpture, and science in the many forms presented.

LIKE SUNBEAMS.—If you have something to say, as a general rule, boil it down. Words are like sunbeams, the more they are condensed, the deeper they burn.

Our Illustrations.

PLATE 1.—A correct and truthful representation of the Garfield Monument erected in the City Park, San Francisco, sketched from real life by Mr. Oliver Everett, of the architectural firm of Huerne & Everett.

The design has received adverse criticism generally, as being faulty in many of its details, and very far from pleasing in general effect. The poise of the central figure is not good, with the fore part of the right foot projecting over the edge of the cap-stone, and the hands compressing the stomach, suggestive of pain within, rather than a natural and free attitude. The pedestal itself, while fair in proportions, is not striking in any of its features, while the much-too-large female figure resting at its base is, to the common observer, cumbersome, and more an eye-sore than a thing of beauty and appropriateness. The shields at the sides are also objectionable, being more conspicuous than graceful.

It would be more pleasing to express all praise and admiration, but the facts do not justify it. And the original designer being a young San Franciscan, it is to be regretted that he has not won greater and fairer laurels. Still the seeds of promise are to be seen, and, hereafter, Mr. Happensberger may prove himself a foe to be feared in future competitions.

Figure 1, Plate 2.—Original plans of a two-story residence, situated on twenty-first Street, between Mission and Valencia, owned by Mr. John L. Boone, as it appeared before alteration; built by the Real Estate Associates.

Figure 2, Plate 2.—Front elevation of the same after alteration, with corner bay window and tower on new section.

Plates 3 and 4.—Main and second stories after alteration. The tower is to be reached by means of a comfortable ladder piercing the ceiling of the bath-room, thence along a passage way to the front of the building.

Is Our Wood Supply Failing?

AT the recent meeting of the Society of Engineers at Deer Park, Md., a valuable paper was read on the "Preservation of Forests." The paper presented a large number of statistics, collected from various sources, to show the necessity of exercising economy in the use of forest products and the possibility of a wood famine. The writer concluded that the supply of white pine in the United States is certain to be exhausted before the end of this century, and probably in Canada also. Of Southern pine, at the present rate of consumption, there is stated to be 150 years' supply of spruce and hemlock. East of the Mississippi there is probably twenty-five years' supply of hard woods. The supply of black walnut and ash is being rapidly exhausted. The supplies of other kinds of wood are, however, so abundant that a famine cannot be predicted. In reference to tree-planting, the writer stated that when intelligently undertaken in regions where timber is scarce a fair return is made on the investment.—*Exchange.*

FIG. 2.

PLATE 2.

The Country's Progress.

THE following statistics show the growth of the country since the year 1860:—

Twenty-five years ago we were 30,000,000 of people; now we are over 50,000,000.

Then we had 141 cities and towns of over 8,000 inhabitants, now we have 286 of such cities and towns. Then the total population of our cities was 5,000,000; now it is about 12,000,000.

Our coal mines then produced 14,000,000 tons, now 85,000,000 tons, or six times as much.

The iron product amounted to 900,000 tons of ore; to-day it foots up over 8,000,000 tons a year, almost a nine-fold increase.

In 1860 our metal industries employed about 53,000 hands, consumed $100,000,000 worth of material, and turned out about $180,000,000 in annual products.

To-day these same industries employ 300,000 hands, consume $380,000,000 of material, and their annual product amounts to $660,000,000 a year.

In 1860 the wood industries employed 130,000 persons; to-day they employ 340,000, while the value of their annual product has trebled.

The woolen industry employed 60,000 persons then, and now employs 160,000, while our home mills, which produced goods of the value of $80,000,000 in 1860, now turn out an annual product worth $270,000,000.

Finally there is cotton. In 1860 we imported 227,000,000 yards of cotton goods; in 1881 we only imported 70,000,000 yards.

In the meantime the number of hands employed in American cotton mills has increased to 200,000, and we export over 150,000,000 yards of cotton goods a year, instead of importing 227,000,000 yards as we used to do.

The silk industry employed 5,000 persons, now it employs about 35,000, seven times as many.

We import no more silk goods now than we did in 1860, but our own mills, which produced goods of the value of $6,000,000 then, now turn out a product of over $40,000,000 yearly.

In 1860, 12,000 persons were employed in American pottery and stoneware works; to-day about 36,000 are employed in this industry.

The chemical industry, which employed 6,000 persons then, now employs 30,000.

In the meantime we have nearly five times as many miles of railways, and double the number of farms, and yielding more than double the number of bushels of cereals.

In the production of sheep we had 22,000,000 of them in 1860, to-day we have over 40,000,000 of them; and whereas we then produced in this country 60,000,000 pounds of wool, now we produce 240,000,000 pounds.

Finally, the total of our exports has doubled. In 1860 it stood at $400,000,000, and now it stands at about $900,000,000.—*Philadelphia Commercial List.*

The City of London.

THIS city was anciently founded on the north side of the river, and down to a time comparatively recent the south bank was not thickly inhabited. As soon as people began to extend beyond the city walls, the phenomena so common in great cities showed itself, and the wealthy moved westward, leaving the poor to extend eastward. Various causes have led to a prodigious increase in the extent of London, and it is now difficult to assign limits to what is almost more a compact province than an extended city. Places that formerly were remote suburban villages have been completely swallowed up, and many outlying districts that are situated outside the metropolitan boundary are really connected with the heart of London by unbroken lines of streets and houses. You may now go from Holloway on the north to Penge on the south, or from Stratford on the east to Putney on the west, without passing an unoccupied field.

It will be easily understood that even the refuse from so large a city constitutes a great difficulty. Much land is now occupied by houses which was once so far out of the way that it was used as a deposit for ashes, dust, and garbage.

London streets, even important ones, are, generally speaking, narrow, and the houses low. In some of the newer districts wide streets have been laid out, and the exigencies of traffic are constantly causing old thoroughfares to be widened and straightened at enormous expense. In many of the oldest parts of London, however, tortuous lanes and narrow alleys, and blind streets abound, and the houses have little or no land in the shape of fore-court or back-yard attached. London enjoys a compensation for her narrow thoroughfares in the number of fine open spaces. The parks have been well called the lungs of London; and, in addition to them, the many squares and the wide channel of the Thames provide a sensible and welcome relief from the crowded and compact mass of dwelling houses.—*Sanitary News.*

Work on the Capitol tower at Albany has made good progress this summer. It has risen thirteen feet, and before cold weather it will reach the point where the cone begins. The first curve of stone for the western staircase has been laid. The electric wires are being carried through all the furnished portions of the edifice, and the legislative rooms are being carpeted anew.

The ten finest buildings in this country, according to the majority vote given in the Boston *American Architect*, are Trinity Church, Boston; the Capitol at Washington; W. K. Vanderbilt's house, Trinity Church, and the Jefferson Market Court House, New York; the City Hall, Hartford; City Hall and State Capitol, Albany; Sever Hall, Cambridge, Mass.; and Town Hall, North Easton, Mass.

The Building Acts in London.

THERE have been building acts in London ever since the period of the great fire, mainly directed to diminishing the risk of another general conflagration. Of the acts now in force, which are numerous, the most important are the metropolis local management act, and the metropolitan building act, with sundry amending acts. The former of these contains, speaking broadly, the regulations as to drains and streets, the latter those affecting buildings. The central authority for drainage, etc., within the ancient and comparatively small limits of the city proper is the city commissioners of sewers, a branch of the corporation. That for the rest of the metropolis proper is the metropolitan board of works—having affiliated to it a series of local boards, each consisting of a group of parishes or a single parish. Beyond the boundaries to which these acts apply there extends a large inhabited zone, forming, so to speak, a third division. Drainage is under the direction of surveyors, who are the salaried officers of the various boards. The building act is administered by a large number of district surveyors, who are architects in practice, and each intrusted with the supervision of the buildings in one locality.

The building act, besides attempting to secure a minimun of strength and solidity in walls, and requiring many precautions against the risk of fire, contains some sanitary regulations of considerable importance and value, though the management act is the one mainly directed to sanitation.—*Sanitary News.*

Evidences are abundant and conclusive in regard to the lasting properties of cypress wood. Hence it is gradually creeping into use more and more each year. Already it is being used in many houses in New York City in finishing, with calls for more. Five million shingles is the estimated amount of consumption in the New York market, with an increasing demand. At least 3,000,000 feet of the wood will be required to supply the market in railroad ties. It is exported to some extent to various ports. Railroad ties have been sent to Cuba, France, and England. Lumber has been sent abroad, but in no great quantities.

The employment of cast-iron columns as main supports has been greatly restricted at Berlin by a regulation issued from the architect's department of the police authorities of that city. The order has been issued in consequence of a discovery made last winter at a fire, when it was found that the cast-iron columns had been cracked by the effect of the cold water playing on them while hot. The authorities now insist that where partition walls rest upon cast-iron columns, the latter are to be covered with plaster or bricked in, with an air space between the bricks and the column.

People who advertise only once in three months forget that most folks cannot remember anything longer than about thirty days.

A Nation's Hero Gone to Rest.

NOTHING that we could possibly indite, would add a single iota to the universal homage paid to the memory of the illustrious dead. It has been the lot of but few men to reach an eminence so high and grand, and secure a love and admiration so devout and universal, as did the honored one who at his death and burial aroused the profound and heartfelt sympathies and sorrow of fifty millions of his own people, and in which millions in other lands united—feeling that a truly great, brave, and good man had passed away.

But while he no longer in person mingles in the active scenes of life, he lives in the memory of present generations, and will live in history through all future ages, as one of the noblest and best of his race; and his examples will pass down through coming periods as a guiding star to millions yet unborn. Truly may it be said, though dead, he yet speaketh.

As in life his influence was powerful, in death it was mighty, serving more than any other one event could do, in breaking down sectional asperities and sentiments, restoring the waste places in our national brotherhood, and uniting the people of our common country in sympathies and purposes never, we trust, to be again interrupted.

National Academy of Designs.

IT is proposed to admit a limited number of leading American architects to the National Academy of Design—a step long since adopted by the British Royal Academy and the French Institute. Several architects are already active members. On this head the *American Architect*, referring to this subject, says: "It is much to be desired that architects and other artists should be brought more together in this country, and every movement *for bringing* about more intimate relations will be warmly promoted by those who best understand the advantages to be gained in this way. . . . It is true that the simple election of a man as a national academician would not imbue him with artistic feeling, nor secure to him always the co-operation of his brother academicians in his work, but it would do something to interest him in other artists and them in him, while the admission of architectural drawings to the annual exhibitions would do still more; and . . . the mutual acquaintance of persons of tastes so similar could not fail to be in some way pleasant and serviceable to all."—*Ex.*

The manufacture of steel nails has made rapid progress since 1883, in which year this industry may be said to have had its beginning. During the last year there were 393,482 kegs of steel nails manufactured, the production of the three leading nail-making States being as follows: West Virginia, 204,336 kegs; Ohio, 130,636 kegs, and Pennsylvania, 29,224 kegs. In 1883 this country produced only 18,224 kegs of steel nails.—*Mining Herald and Colliery Engineer.*

PLATE 3.

APPROACHING EARTHQUAKES.—The earthquake shocks which were felt recently over a wide area in Yorkshire remind us that an authority on the subject of these phenomena, M. Delaunay, of Paris, is of opinion that next year will see the recurrence of upheavals of the earth's crust in an intensified form. M. Delaunay is a prophet of evil, but unfortunately all his prophecies have hitherto come true. His specialty is earthquakes, and he predicts them only too surely. In 1877 he announced that the year would not conclude without violent disturbances of the earth, and as a matter of fact, two frightful catastrophes on the coasts of South America followed. In 1883 M. Delaunay again pointed to approaching earthquakes, and soon after the volcanic eruptions in the Indian Archipelago occurred, by which thousands of human beings lost their lives, and hundreds of square miles of terra firma were engulfed by the sea. Towards the end of last year M. Delaunay once more raised his warning voice, and the earthquakes in Spain proved how well founded were his warnings. Quite recently he has prophesied very severe volcanic disturbances for 1886. Having acquired a well-merited notoriety in foretelling earthquakes, some weight ought to be attached to M. Delaunay's utterances. He affirms that next year these natural phenomena will be of a very intense character, and that they will show themselves either when the earth is under the direct influence of a planet of the first rank, such as Jupiter, or under that of a group of asteroids, or at a time when the sun and moon are nearest to our planet at the same time.—*Iron.*

Be Thorough.

ONE of the mistakes that young people make oftener than any other, is that of not being thorough, of thinking that it is no matter how a piece of work is done as long as it can be made to serve the purpose. An article in an exchange gives several examples to show how thorough work pays.

It was Carlyle who said, "Genius is an immense capacity for taking trouble," and George Eliot gives us the same thought in other words: "Genius is at first little more than a great capacity for receiving discipline." The most successful have always been the most painstaking. A prominent judge, living near Cincinnati, wishing to have a rough fence built, sent for a carpenter, and said to him:—

"I want this rence mended to keep out the cattle. There are some unplaned boards; use them. It is out of sight from the house, so you need not take time to make it a neat job. I will pay you only a dollar and a half."

However, afterward, the judge, coming to look at the work, found that the boards were planed, and the fence finished with exceeding neatness. Supposing the young man had done it in order to make a costly job of it, he said angrily: "I told you this fence was to be covered with vines. I do not care how it looks."

"I do," said the carpenter.

"How much do you charge?" asked the judge.

"A dollar and a half," said the man, shouldering his tools.

"Why did you spend all that labor on the job, if not for money?"

"For the job, sir."

"Nobody would have seen the poor work on it."

"But I would have known it was there. No; I'll take only the dollar and a half." And he took it and went away.

Ten years afterward the judge had a contract to give for the building of certain magnificent public buildings. There were many applicants among master-builders, but one face attracted his attention. It was the man who had built the fence.

"I knew," said the judge, afterward telling the story, "we should have only good, genuine work from him. I gave him the contract, and it made a rich man of him."

The Hon. Josiah Quincy was at one time conversing with Daniel Webster upon the importance of doing even the smallest thing thoroughly and well, when the great man related an incident concerning a petty insurance case which was brought to him while a young lawyer in Portsmouth. The fee promised was only twenty dollars. Yet, to do his clients full justice, Webster found he must journey to Boston and consult the law library. This involved an expense about the amount of his fee, but after hesitating a little he decided to go to Boston and consult the authorities, let the cost be what it might. He gained the case. Years after this, Webster was passing through the city of New York. An important insurance case was tried that day, and one of the counsel had been suddenly prostrated by illness. Money was no object, and Webster was asked to name his terms and conduct the case.

"It is preposterous," said he, "to expect me to prepare a legal argument at a few hours' notice."

But when they insisted that he should look at the papers, he consented. It was his old twenty-dollar case over again, and having a remarkable memory, he had all the authorities in his mind, and won the suit. The court knew he had had no time for preparation, and were astonished at the skill with which he handled the case.

"So you see," said Webster, as he concluded, "I was handsomely paid both in fame and money, for that journey to Boston;" and the moral is that good work is rewarded in the end, though, to be sure, one's own self-approval should be enough.

Thoroughness implies attention to details, neatness, and method. A young man who was shrewd and exacting, but whose business habits were careless and unmethodical, succeeded by hard work and economy in establishing a prosperous business, but failed and went into bankruptcy at the early age of thirty-five, because of his carelessness in omitting to put a note for a large amount in his bills payable.—*Western Rural.*

THE GREAT PYRAMID.—Mr. J. B. Bailey writes to the *St. James Gazette* as follows, with reference to the desirability of exploring the great pyramid: "Now that Great Britain is dominant at Cairo, would it not be a good plan to clear away the sand and rubbish from the base of the great pyramid right down to its rocky foundation and try to discover those vast corridors, halls, and temples containing priceless curiosities and treasures with which tradition in all ages has credited the great pyramid? The wonderful building, of such exquisite workmanship, was erected many years before any of the other pyramids, which are only humble imitations, built by another nation, and also for other purposes; for neither King Cheops nor anybody else was ever interred beneath this mighty mass of stone. The smaller pyramids also exhibit neither the nicety of proportion nor the exactness of measurement, both of which characterize the first pyramid. From internal evidence it seems to have been built about the year 2170 B. C., a short time before the birth of Abraham, more than four thousand years ago. This—one of the seven wonders of the world in the days of ancient Greece—is the only one of them all still in existence. The base of this building covers more than thirteen square acres of ground. Its four sides face exactly north, south, east, and west. It is situated in the geographical center of the land surface of the globe. It was originally 485 feet high, and each of its sides measures 762 feet. It is computed to contain 5,000,000 tons of hewn stone, beautifully fitted together with a mere film of cement. And these immense blocks of stone must have been brought from quarries five hundred miles distant from the site of the building. The present well-known king and queen chambers, with the various passages, might also be thoroughly examined by means of electric or lime lights. The astronomer royal of Scotland, some years since, closely and laboriously examined all that is at present known of the interior of this enormous building. He states that measurements in the chambers, etc., show the exact length of the cubit of the Bible—namely, 25 inches. This cubit was used in the building of Noah's ark, Solomon's Temple, etc. He also maintains that the pyramid shows the distance of the sun from the earth to be 91,840,000 miles.

FIRE-PROOF DOORS.—The most efficient fire-proof doors are of wood covered with tinned iron. The door is made of two thicknesses of tongued and grooved boards, crossing each other diagonally and thoroughly nailed together. The sheets of tin are bent over at the edges, forming locked joints as in a tinned roof; it is important that the edges as well as the sides of the door be covered, as its resistance to heat lies in the fact that the fire cannot burn the wood thus protected against exposure to the air, nor can it warp it, as is the case with an iron fire-door subjected to slight heat. If a fire-proof door is hung on hinges, special care must be taken to insure their security by fastening them to the door by means of bolts rather than screws, and connecting them to the wall in an equally secure manner. The latches should be selected with a view to durability, as such a heavy door is apt to be destructive of weak latches. Where the position of the doorway permits sliding doors, it is preferable to have them on tracks, care being taken that cleats be placed on the floor each side of the doorway, so as to secure the door at its lower corners when shut.

In the Boston Storage Warehouse, United States, there are a large number of such doors in the fire-walls, arranged to close an electric circuit when they are all shut, and the fact is recorded on the paper dial of the watchman's clock at certain intervals. Fire-proof doors are frequently arranged to close in advance of a fire by means of the yielding of an alloy fusible at 160° Fahr. The track upon which such a door is hung inclines about one foot in eight feet, and the door is kept from closing by means of a round stick about one inch in diameter, which reaches from one edge of the door to the opposite side of the door-frame. At the middle the stick is cut in two diagonally, and a ferrule, made of two pieces of thin copper soldered together longitudinally with the fusible alloy, covers the joint in the stick. When this ferrule is exposed to a temperature of 160° Fahr., its yielding causes the ferrule to split open, and the stick separates into pieces and allows the door to shut. In order

that the stick shall not fall in the way of the door, and that the door may be shut at any time, the stick is connected to the top of the door-frame by small chains near to each end. This simple device was designed by Mr. Lewis T. Downes, president of the What Cheer Mutual Insurance Company. Another method of utilizing this fusible alloy to close fire-proof doors and shutters, is by means of a wire extending around the room, and containing in various places links made of two pieces of brass soldered together. When the solder melts and allows the two pieces of brass to separate, the wire allows the shutter or door to close. Mr. Frederick Grinnell has improved the ordinary link by cutting a slot in one of the pieces of brass, and laying a short bit of wire therein, when they are being soldered together; the solder flowing around this wire presents a resistance in three planes, in place of the ordinary joint, which may be imperfect and lies in a single plane, concealed by the sheet brass so as to prevent inspection. Formerly solid links of fusible alloy were used, but the metal has so little resilience that it is apt to gradually lengthen, and finally break at some inopportune time.—*Engineering.*

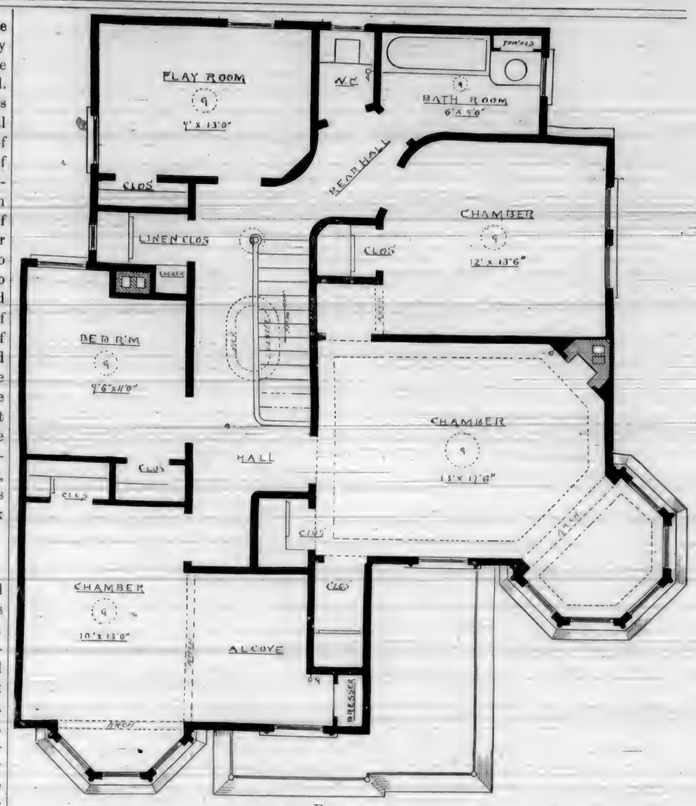

PLATE 4.

Preservation of Building Stones.

DR. R. OGDEN DOREMUS, in a paper read before the American Institute of Architects last autumn, said that a result of porosity in building stones is that buildings, after absorbing water, effloresce, or become covered with a coating of salts, especially brick buildings laid in mortar made from sea sand. This means the decomposition of the material, besides a disagreeable appearance. In Philadelphia, after a rain, the houses are generally thus whitened. This efflorescence cannot be prevented by ordinary paint nor oil. Another dangerous result of porosity is that buildings absorb malaria. Hospitals thus become poisoned with a poison so deadly that he remarked he would sooner give his child the most deadly poison in the laboratory, and trust to the antidote, than expose him to such contagion. He mentioned many well-known buildings that were crumbling away, such as Girard College, the College of New York, Trinity Church, New York. He had dined with Gorringe soon after the obelisk was set up in Central Park, and the subject of the weathering of the obelisk was suggested. Gorringe said that it had stood 4,000 years, and would stand 4,000 years more. But, in fact, the obelisk is crumbling away. He showed several vials full of clippings collected at the foot of it also specimens of stone found peeled off from inside the new Capitol at Albany.

A simple remedy was suggested, and one which has been extensively applied in St. Louis and to some extent in New York, namely, an application of paraffine mixed with a little creosote. The building is heated by a small furnace, and where there is ornamental work a blowpipe is sometimes required to heat depressions. The paraffine is then applied in a melted condition, and sinks in about a quarter of an inch, giving a beautiful and indestructible glossy finish, and rendering the material absolutely waterproof and air-tight. In reply to a question about fire, he said that a fire would only drive it in a little. It costs on an average about fifty cents a yard, and never needs to be applied a second time, as no chemical agent in the air or in the rain affects it at all. Even caustic potash does not unite with it. If the application is made to marble that has been weatherbeaten, the marble should first be cleaned with steel brushes. Marble thus cleaned, however, unless treated with paraffine, soon becomes covered with a yellow stain. Some of the buildings in New York which have been treated with paraffine are St. Mark's Memorial Church; houses 124–6 South Fifth Avenue; Huyler's, corner Eighteenth Street and Irving Place; and a house No. 18 East Fifty-fifth Street, in a brownstone row. Every house in the row except this has its doorsteps "with verdure clad," and the growth of such mosses is destructive to the building material. The paraffine method is confidently commended by Dr. Doremus as the very best ever used.—*Builder.*

TOUGHENING TIMBER.—This is a new process by which it is claimed that whitewood can be made so tough as to require a cold-chisel to split it. This result is reached by steaming the timber and submitting it to end pressure, technically "upsetting" it, thus compressing the cells and fibers into one compact mass. It is the opinion of those who have experimented with the process that wood can be compressed 75 per cent, and that some timber which is now considered unfit for use in such work as carriage building could be made valuable by this means; and more especially since the rapid consumption of our best ash and hickory will sooner or later render some substitute necessary.

A Minneapolis artist, who has been "doing" Alaska, says that all the members of his party, and there were seventy-five of them, agreed that the Greek Church at Sitka is the finest church in America. It is built on the plan of a Greek cross, and the interior is a mass of gold and silver, of a magnificence of which a writer says he can give no idea. The walls are hung with pictures of royalty and the priesthood, sent by a Russian princess, who took this temple under her patronage.

MILL WORK ABUSED IN HANDLING.—This is a thing of common occurrence in the handling and transporting of finishes, doors, blinds, etc. Sometimes damage is done in passing the work out of the mill; such as spauling the arrises and bruising the faces and edges. But the chief source of injury occurs in the loading and unloading, many of the teamsters being of the "baggage-smasher" type, practicing but little consideration for the thing handled, so that it gets on and off the wagon, and the hauling is paid for. Frequently, by the time the mill work, doors and finishes, reaches a building, there are a great many marks, scratches, indentations, and defacements, which often cause trouble and annoyance alike to builder and architect; the former disliking to use the damaged work, which sometimes is of a character that smoothing up and sand-papering will not remedy; but as it is not always the case that the party damaging the work can be found, to fix the responsibility, as "nobody" is always the guilty party, and the contractor, rather than to discard the damaged work, and at extra expense and cost obtain perfect materials, very naturally seeks to use the imperfect, even at some sacrifice of perfect workmanship in the finishes; unless the defects are too glaringly bad, this is a natural result when dollars and cents, and a scrupulous nicety about small things, are the two opposing factors; the former is looked upon and guarded with a more jealous eye, and obtains the benefit of every doubt. If all this can be without noticeable irregularities, and results not discreditable to the architect, nobody is specially harmed; but often such defects are "fixed up" in such a shape that the architect is expected to pass them, at the sacrifice of his own judgment and ambition in the production of perfect workmanship. Ugly issues often spring from the causes outlined, by reason of the architect objecting to defects caused more through carelessness than design, yet of such character as to mar the completeness and perfectness of the workmanship involved; and although the defects may be of no great magnitude in themselves, simply a scratch or a bruise, the effect produced to the technical and practical eye of the architect competent to appreciate the niceties of perfect workmanship, is disagreeable and repulsive, and fully justifies complaint, and a refusal to accept such work.

A SMALL GREASE SPOT OR STAIN

On the dress suit of either a lady or gentleman is a *small matter* in and of itself, still no *tidy* person would willingly appear in public, or in social intercourse, until that *little* thing was removed; because "*it spoils the look of the dress.*" And so in ten thousand other things, "looks"—appearances—produce effects, and judgment more generally follows and is shaped by the impressions made upon the visual organs. If this is so in matters generally, why not in reference to the finishes in buildings, which are continuously in view, either seen or handled every hour of the day, forming one of the permanent surroundings of the home circle. In this view of the case, an architect cannot be "too particular" and exacting, as upon him rests every responsibility as to the harmonies and niceties which are calculated to make the abode of his client as nearly perfect as possible, all things considered.

TEAMSTERS MOST AT FAULT.

They are often unpardonably careless, dragging and tossing finished work as though it were of but little more importance than a dry goods box or an empty barrel. It is common to see the face casings of window and door panels laid on the iron bound edges of the sides of wagons, and otherwise crossing each other with no attempt at protection from chafing, and thus rode for blocks or miles over rough streets and roadways, with the friction at every step of the horses grinding away the fibers of the wood at the points of contact; so that by the time the place of destiny is reached, the things transported are in parts not fit for use. Not only the same thing occurs with panel doors, but they are often pushed and dragged on and off the load, when laid flatwise, with ungainly indentations made by the ends of the stiles digging into the horizontal parts. All this is bad, should not be, and could easily be avoided by a little care, and with cushions on the sides of the wagons to prevent the friction caused by the iron and wood coming in contact.

Hints on the Care of Tools.

THE following hints on the best means of keeping tools in good condition, which we take from the *Building and Engineering Times*, of London, cannot fail to be useful.

Wooden Parts.—The wooden parts of tools, such as the stocks of planes and handles of chisels, are often made to have a nice appearance by French polishing; but this adds nothing to their durability. A much better plan is to let them soak in linseed oil for a week, and rub them with a cloth for a few minutes every day for a week or two. This produces a beautiful surface, and at the same time exerts a solidifying and preservative action on the wood.

Iron Parts.—Rust preventives.—The following recipes are recommended for preventing rust on iron and steel surfaces:—

1. Caoutchouc oil is said to have proved efficient in preventing rust, and to have been adopted by the German army. It only requires to be spread with a piece of flannel in a very thin layer over the metallic surface, and allowed to dry up. Such a coating will afford security against all atmospheric influences, and will not show any cracks under the microscope after a year's standing. To remove it, the article has simply to be treated with caoutchouc oil again, and washed after 12 to 24 hours.

2. A solution of India rubber in benzine has been used for years as a coating for steel, iron, and lead, and has been found a simple means of keeping them from oxidizing. It can be easily applied with a brush, and is easily rubbed off. It should be made about the consistency of cream.

3. All steel articles can be perfectly preserved from rust by putting a lump of freshly-burnt lime in the drawer or case in which they are kept. If the things are to be moved (as a gun in its case, for instance), put the lime in a muslin bag. This is especially valuable for specimens of iron when fractured, for in a moderately dry place the lime will not want any renewing for many years, as it is capable of absorbing a large quantity of moisture. Articles in use should be placed in a box nearly filled with thoroughly pulverized slaked lime. Before using them, rub well with a woolen cloth.

4. The following mixture forms an excellent brown coating for protecting iron and steel from rust: Dissolve two parts crystallized iron chloride, two antimony chloride, and one tannin, in four water, and apply with a sponge or rag, and let dry. Then another coat of the paint is applied, and again another, if necessary, until the color becomes as dark as desired. When dry it is washed with water, allowed to dry again, and the surface polished with boiled linseed oil. The antimony chloride must be as nearly neutral as possible.

5. To keep tools from rusting, take ½ ounce camphor, dissolve in 1 pound melted lard; take off the scum and mix in as much fine black lead (graphite) as will give it an iron color. Clean the tools and smear with this mixture. After 24 hours rub clean with a soft linen cloth. The tools will keep clean for months under ordinary circumstances.

6. Put 1 quart fresh slaked lime, ½ pound washing soda, ½ pound soft soap in a bucket; and sufficient water to cover the articles; put in the tools as soon as possible after use, and wipe them up next morning, or let them remain until wanted.

7. Soft soap, with half its weight of pearl-ash, 1 ounce of mixture in about 1 gallon boiling water, is in every-day use in most engineers' shops in the drip-cans used for turning long articles bright in wrought-iron and steel. The work, though constantly moist, does not rust, and bright nuts are immersed in it for days till wanted, and retain their polish.

8. Melt slowly together 6 ounces or 8 ounces lard to 1 ounce resin, stirring till cool; when it is semi-fluid, it is ready for use. If too thick, it may be further let down by coal oil or benzine. Rubbed on bright surfaces ever so thinly it preserves the polish effectually, and may be readily rubbed off.

9. To protect metals from oxidation—polished iron or steel, for instance—the requisite is to exclude air and moisture from the actual metallic surface; wherefore, polished tools are usually kept in wrappings of oil cloth and brown paper; and, thus protected, they will preserve a spotless face for an unlimited time. When these metals come to be of necessity exposed, in being converted to use, it is necessary to protect them by means of some permanent dressing; and boiled linseed oil, which forms a lasting film of covering as it dries on, is one of the best preservatives, if not the best. But in order to give it body, it should be thickened by the addition of some pigment, and the very best—because the most congenial—of pigments is the ground oxide of the same metal—or, in plain words, rusted iron reduced to an impalpable powder, for the dressing of iron or steel—which thus forms the pigment or red oxide paint.

10. Slake a piece of quick lime with just water enough to cause it to crumble, in a covered pot, and while hot add tallow to it and work into a paste and use this to cover over bright work; it can be easily wiped off.

11. Olmstead's varnish is made by melting 2 ounces resin in 1 pound fresh sweet lard, melting the resin first and then adding the lard and mixing thoroughly. This is applied to the metal, which should be warm if possible, and perfectly cleaned; it is afterwards rubbed off. This has been well proved and tested for many years, and is particularly well suited for planished and Russia iron surfaces, which a slight rust is apt to injure very seriously.

Rust Removers.—1. Cover the metal with sweet oil well rubbed in, and allow to stand for 48 hours; smear with oil applied freely with a feather or piece of cotton wool, after rubbing the steel. Then rub with unslaked lime reduced to as fine a powder as possible.

2. Immerse the article to be cleaned for a few minutes, until all the dirt and rust is taken off, in a strong solution of potassium cyanide, say about ½ ounce in a wine-glassful of water, take it out and clean it with a toothbrush with some paste composed of potassium cyanide, Castile soap, whiting and water, mixed into a paste of about the consistency of thick cream.

What Mr. Spurgeon said about advertising in one of his recent lectures: "Advertise, for the life of business is printers' ink." He probably, at the time, had in mind the fact that advertising is the staff of life in trade, just as bread is the staff of human life. For if a man wants his name and business to be known, he must keep them before the people. He must let them know where he is, what he is, and what he is doing. What! you doubt if advertising in trade journals does this so effectually as other methods you might mention? Where do you look to find the names of the most successful men you are acquainted with in trade? In the trade papers? Of course. Is your name beside theirs? A commercial man who gets through life persistently ignoring the value of advertising might have his brains exchanged for the stump of a crossing-sweeper's broom, and get along quite as well. Why, when people see a man advertise they know at once he is a business man, and his advertising proclaims that he is not above business, but anxious to do business.

The new building law for the city of New York, which has just been published, proves to be in many respects better and more convenient than that which it supersedes; and although we are rather disappointed to find that some of the improvements which might have been adopted have not been, the statute, on the whole, marks a decided advance in the official regulation of construction in this country. Among its other merits, the text of the new law embodies many regulations and decisions of the Inspector, which have hitherto formed, so to speak, a part of the common law in regard to building operations, but, not appearing in the official edition of the statute, were only to be learned by architects at the expense of a good deal of trouble and annoyance; and these, particularly the younger ones, will be glad to have at least the greater part of what they are expected to know presented to them in shape for use. One of the principal points of difference between the new and the old law relates to the thickness of brick walls; stone walls, by the way, being entirely ignored in both laws. According to the former statute, no authority could be obtained for building any brick walls less than twelve inches in thickness. The powers of the law seem to have assumed that no New Yorker, however poor, would condescend to live in anything less imposing than a four-story house; and they oblige the builder of a house ten feet high to make all the walls exactly as thick as if it were fifty-five feet high. This provision, by unreasonably increasing the cost of small dwellings, has undoubtedly tended strongly to drive the poorer people of the city into the tenement-houses, which form the reproach of New York; and the new law, very wisely, as we think, modifies the rule so far as to allow houses not more than twenty feet wide, and thirty feet high, to be built with eight-inch walls above the basement, and so that blocks of houses twelve and one-half feet wide, and not over fifty feet high may be built with every alternate party-wall eight inches thick. There is no question that an eight-inch wall, which is, in proportion to its mass, the strongest wall which can be built with bricks, possesses ample strength, if properly built, for carrying the floors and roof of a dwelling house of such modest dimensions; and although the brick-makers may regret the change, hundreds of independent and home-loving workingmen will welcome it as bestowing upon them the long-desired privilege of building and owning houses on terms as favorable as those which their brethren in Philadelphia and other cities enjoy.—*American Architect and Building News.*

The strongest wood in the United States according to Prof. Sargent, is that of the nutmeg hickory of the Arkansas region, and the weakest the West Indian birch (*bur seva*). The most elastic is the tamarack, the white or shellbark hickory standing far below it. The least elastic and the lowest in specific gravity is the wood of the *Ficus aurea*. The highest specific gravity, upon which in general depends value as fuel, is attained by the blue-wood of Texas, *Condalia obovata*.

TIMBER IN WASHINGTON TERRITORY.—Some idea of the great wealth of the timbered lands in the western part of Washington Territory may be gleaned from the following report which we take from the Portland, Oregon, *Journal of Commerce*:—

All that portion of Washington Territory lying between the Cascade Range on the east, Coast or Olympic Range on the west, and between the 47th and 49th degrees of north latitude, is a thickly timbered belt of fir, cedar, alder, maple, and other woods. Of these fir probably represents three-fourths. In the midst of this wealth of forest, nature has placed a broad, deep arm of the Pacific Ocean—Puget Sound—with which it is connected by the Strait of Fuca. Thus not only has nature provided the timber, but the water-way also, by which it is possible for the merchant marine of the world to come and obtain their lumber supplies, much of which sometime in the future must be furnished from these forests. Already the lumber trade with Australia, Central and South America, China, and the islands of the Pacific amounts to fully 75,000,000 feet a year, and employs a fleet of about fifteen vessels every month.

Puget Sound is 200 miles long, and has a shore line of 1,800 miles. This irregular shore line forms innumerable harbors splendidly adapted for the erection of saw-mills and other wood-working factories, and also for the establishment of ship yards. Along this whole shore line, and from thence on both sides as far as the eye reaches, nothing can be seen but the vast and magnificent wealth of timber, save here and there where man has established a mill port, a town, or an occasional farm.

In the timber belt of western Washington there are 20,000,000 acres covered with timber, most of which is included within the limits named—an area nearly equal to the combined areas of the states of Connecticut, Massachusetts, Vermont, and New Hampshire. This timber belt will average 25,000 feet of lumber to the acre, or a total of 500,000,000,000 feet of lumber. Hence the saw-mills of Puget Sound, with their present capacity of 500,000,000 feet per year, would take 1,000 years to cut it down. The fir trees frequently attain the height of 250 feet, and planks of lumber are sometimes turned out of these mills 100 feet in length.

There are now erected in this district, as near as we can ascertain, 24 mills, the aggregate value of which is $5,320,000, with a daily cut of 1,300,000 feet.

In addition to the foregoing statement of the wealth of the mill corporations, very many of them also own sailing vessels and steamers, which are engaged in carrying lumber from the various mill ports to San Francisco and foreign ports. Many of these corporations have agencies in San Francisco, where they own properties in the shape of lumber yards.—*American Engineer.*

The Architects of California.

THE profession upon this coast is numerically large, and in the number there are many most excellent, competent, and honorable gentlemen, as also some who have assumed the practice of the profession without the possession of those essential, architectural, mechanical, and moral qualifications, so necessary to the proper administration of the responsibilities and duties devolving upon qualified architects. But this coast is not an exception in this regard, nor are the lesser class peculiar to the present age. The records of an hundred years ago, and through all periods since then, the complaint of learned and qualified architects in the United States and England, has been the presence, in the profession, of men of exceedingly mediocre attainments, with no higher ambition or aim than the sordid purpose of making money, without any scruples or regard as to the deceit and falsehood that are and must necessarily be practiced by those who have no true merit to recommend them, and who are compelled to rely upon a glib tongue, and wordy commendations of themselves, to entrap unsuspecting clients.

But the purpose of this article is not to dwell upon this class of pretenders, but to suggest a few thoughts to the leading and honorable members of the profession, with whom must emanate, and by whom must be carried into practical execution, the measure necessary to protect the honor and elevate the standard of architectural practices on this coast.

The nucleus for reformatory operations exists in the chapter of architects, which has already accomplished a greater work and influence for good than is accredited by those who have not yielded their personal and apparently selfish notions to a magnanimous acceptance of the possible benefits so manifestly plain, in a united, manly, and earnest commingling as brethren of a highly honorable profession. It may be that some who are not, are the equals of others who are Fellows of the chapter, and who recognize no necessity to become members, feeling confident in their own abilities to conduct their affairs satisfactorily and remuneratively without any assistance. This may be so, but the possessor of great resources is the man who can best afford to be generous. Those who are gifted and learned lose nothing by dispensing to others that which has come to them in abundance. No one lessens his store of knowledge by making others wiser, nor are his individual advantages diminished by an unfolding of facts and principles of life and business calculated to improve and benefit others; and the presumption is fair that, when men who might render assistance in a good cause refuse to do so for reasons not sustained by liberal and generous conclusions, there is a weak point somewhere in their own make-up which might be improved.

But, aside from all this, the architectural profession should be inspired by the high purposes which influence the members of the legal, medical, and other professions to form in society relationships for mutual benefit in the advancement of the respective sciences, and for the protection of their best welfare; to develop methods of improvement among themselves, and scrupulously guard against encroachments and practices of demoralizing character. There is not a true member of the architectural profession who may not accomplish good for himself by aiding in a work of this kind, by mingling with others in advanced movements, and assisting in organizing and maturing measures calculated to better conditions.

It is pleasing to note the good fellowship and kindly professional sentiment which seems to exist among, and permeate the intercourse of architects in many of the States of the Union. The reports of proceedings in numerous cases forcibly illustrate the fact that men with like aims in life's pursuits can lift themselves above all personal bias and prejudices, and all belittling views, and rise to a higher sphere of action, co-operating with one common purpose for mutual interest. Thus it should be, and the more rapid approach to highest possible attainments in architectural science will be the more completely and perfectly accomplished, when this kindly and enlarged feeling and sentiment becomes comparatively universal. It should be so in California, and we need it more from the fact of isolation, and the limited opportunities to gather strength by contact with the advantages enjoyed by architects operating at or in close proximity to the great centers of magnificent structures, and who within a few hours' ride at most, are enabled to pass from city, through country districts, towns and villages, to other cities, gathering new information, ideas, and food for thought and application, and receiving, through the eye and senses, practical suggestions from the thousands of architectural demonstrations presenting themselves at every point. Not so in Californi . The opportunities are less and circumscribed by local bound; which fact should incite to united and earnest effort in at least seeking to work out the best possible good for the profession as a whole, and in establishing rules and regulations calculated to inspire honorable ambitions and practices, and restraining and correcting, or stamping with disfavor, all individual irregularities, in whatever form they may be found.

A Correspondent of the London "Field" says: If one wants a carriage or implement photographed so as to make a working copy to scale, all that is necessary is, when the photo is being taken, that a clear and distinct three-foot rule be placed on the carriage; this is photographed along with the carriage, and, no matter what the size of the print or negative, will always be a true scale. It enlarges and diminishes in exactly the same proportion as the carriage.

An Architect's Responsibility.

THIS is a matter about which there are various erroneous notions afloat among the very parties who ought to understand just what responsibility can be properly and justly laid on the shoulders of architects. Probably the most erroneous ideas are those concerning the cost of the work. It is a popular belief that an architect's estimate of the cost of any proposed work is always exceeded by the actual cost, and there is a strong disposition to hold him accountable for this increased cost. It is our opinion, however, that a careful examination of the majority of such cases will show that the extra cost is chargeable to specific demands of the client, based upon the conception that somehow or other he is going to get more for his money than others get; or else from not comprehending the fact that a requirement, which in itself may be inexpensive, often carries in its train extra expenses that foot up to a large total. The client is not, of course, always to blame. We are aware that there is a large class of architects who, for fear of discouraging their clients in the beginning, systematically make all sorts of encouraging responses to inquiries regarding the cost, and doing everything to get a building enterprise embarked for the sake of the fee involved. In considering the responsibility of such architects as these, it must be borne in mind that there are few who descend to false representations in order to gain work, to whom mistakes and blunders can carry any adequate punishment by means of condemnation of their work. After they have secured the work, and it has been executed and paid for, what do they care for any questions of responsibility that may arise? They will find other clients, and their practice may not suffer. They are often successful men, and it is because some of them are frequently taken as typical of the whole race of architects that popular impressions arise that are the reverse of flattering to the profession as a whole.

Let us take such a case as the following: A man makes up his mind to an expenditure of $10,000, and goes to his architect with his wants really based on that amount, but telling him that the most he can spend is $8,500. The architect is one of the class we have been considering, and very likely thinks of nothing but producing fine sketches that will catch his client's eye. This he succeeds in doing perfectly, for he is a clever architect when not limited much as to cost. At the last moment, and perhaps because the client himself feels some doubts, the architect is told of the real amount that can be expended, but he is strongly cautioned that this amount cannot under any circumstances be exceeded. The lowest bid comes in about $11,500, but the client is so in love with the design on which he has set his heart, that he finally decides to go on with it. After the work is under way, various matters crop out that had not been appreciated before, and some things seen only in dim perspective begin to loom up in a very expensive manner. Of course, the client knew that the heating and mantels were not included, but he was not prepared for sundry other necessities, and he objected to be continually obliged to increase his scale of expenditure throughout. Hence, when he found that the actual cost of the house was $15,000, he, in his own mind, laid the blame on his architect. In such a case as this the popular judgment is right. The architect is to blame. It is his duty to forewarn his client in the beginning clearly in regard to cost, and if he does not do so, his responsibility is direct. Further than this, if an architect makes misleading statements in order to induce his client to build, we do not see but what he could be held responsible at an action for damages, although it might not be easy to secure the proof unless it was documentary. We do not mean that an architect is bound to state the exact cost. This he cannot do; for even skillful contractors will differ as much as $2,000 on $12,000 worth of work. But an architect is certainly in a better position to know the cost than his client; and if his client is evidently expecting too much for his money, it is an architect's duty to inform him of the facts—*i. e.*, that the *probabilities* are that the cost will exceed the amount appropriated. A little plain speaking on this point at the beginning would relieve an architect of the responsibility for the increased expenditure in case there should be any.

In most cases, however, we think the responsibility for the cost is justly laid at the client's door, the facts being somewhat as follows: The prospective house owner, if he is unacquainted with the building business, fails to realize that when he goes to his architect and says, "I do not wish to spend over $10,000 under any circumstances whatever," he ought to stop right there if he wishes to hold any one but himself responsible for not exceeding this limit. Suppose the client, after saying as much as this and outlining his general needs as to rooms and peculiarities of living, site, etc., should trust rigidly to the architect for everything else—let the architect determine how much or how little hard wood shall be used, and the scale of the finish throughout. At the same time, let it be understood that the architect is to be held accountable for the result. Is it not a reasonable supposition that the cost would rarely be exceeded? Of course, a sensible architect in such a case would not bind himself down to an exact limit of cost, but if it was understood that his reputation depended upon his success in getting a good thing for the money, we think that the result would in most cases be creditable to architects as estimators. Nowadays there is too much designing without reference to cost. There is far more merit in solving a difficult problem—to build well on a minimum allowance—than to design cleverly, artistically, but, unfortunately, with a total disregard of cost. Any one can design a fairly good thing for $20,000 we will say; but if the limit was $15,000, where is the merit? We are aware, however, that clients do not leave details to their architects. The more usual course for the client is, after the sketches are made, based we will say on $10,000, to casually mention first one thing and then another, until, by the time the working drawings are completed, a complete category of increased demands not originally contemplated in the sketches, if such a thing were possible, would be astonishing. It is in this way that honestly-estimated sketches lead to increased outlays; and even if an architect is able to point these out to his client, or even if the client has been warned that he is expecting too much, the result is that the architect has to shoulder the blame.—*Building.*

Nuisances Not Due to Plumbing Work.

TWO INSTANCES came to our notice a few days ago which are very good illustrations of the fact which has been often proved, that shortcomings in the household economy are responsible for many complaints of sewer-gas. In the first instance, such complaints were made to a plumber about a house in the best quarter of Jersey City. When he visited it, he was satisfied at once that the odor was not due, as the people in the house supposed, to defects in the plumbing. He suspected dead rats. After a good deal of difficulty, the decaying body of one rat was found between the floor and ceiling; but the odors continued, and it required a week or two of tearing up of floors to get out all the carcasses, some half-dozen, in various stages of decay. But even this did not entirely free the house from the bad smells, and then search was made through the cellar. On a shelf was found a chicken-coop and the filth which would accumulate around such, and when this was removed and the cellar aired, the bad odors disappeared. Yet the family were persuaded at first that their plumbing was bad, and the plumber's reputation would have suffered had he not insisted on a thorough search for the cause of the smells.

In the second case a lady, who prided herself on careful housekeeping and neatness, sent for a plumber in some alarm because bad smells were pervading her house. The plumber informed her at once that it was swill-barrel and not plumbing-work. This was denied; the lady was sure her servants were too well trained to keep a foul garbage-barrel about, but the plumber insisted on looking for the cause, and soon discovered in the rear cellar a barrel with decaying vegetables, which had evidently not been emptied for some time, and had a very "loud" smell. This discovery satisfied the lady. The barrel was removed, the cellar aired, and no more sewer-gas was heard of.

These two cases carry their own moral, now that hot weather is here, and there are many more like them.

Graphite Roofing Paint.

AS FEW of our readers are thoroughly familiar with the nature and properties of graphite, a few general remarks will not be inappropriate before referring to it as a material for roofing paints. Graphite is one of the multitudinous forms in which carbon is found in nearly a pure state. The substance is variously known as graphite, plumbago, and black lead, the last two of which, however, convey the erroneous impression that it is in some way associated with the metal lead. It occurs in nature in different forms, varying from graphite nearly chemically pure to rocks and clays containing a small percentage of the mineral. Its most common use is for pencil leads, for which purpose it is mixed with varying proportions of clay to give the desired hardness. The two most extensive uses to which it is put is in the manufacture of crucibles and similar refractory articles and stove polish. Its peculiar properties are such as to make it an excellent material for roofing paints. Although this use of it has been known for some years, its manufacture is principally confined to one firm, the Joseph Dixon Crucible Company, Jersey City, N. J., who, besides, manufacture graphite for various other purposes.

The method of preparing it for roofing paints, as carried on by the above company, is very simple, and consists essentially in pulverizing the rock containing the graphite, and removing the silica by a leaching process until the remaining compound is suitable for paint. The process is stopped when the product analysis about 70 per cent. graphite and 30 per cent. silica, which proportions are thought to give the best results in roofing paints. This product is next finely ground in boiled linseed oil, in which form as a thick pigment it is put upon the market. The paint when used is thinned with boiled linseed oil until it has the desired consistency, and applied with a brush in the usual manner. Apart from the question of cost, and the fact that, owing to its lesser weight, a pound will cover a larger surface than a similar weight of heavy, mineral paint, graphite has many properties that are said to make it especially valuable as a roofing paint. The spreading properties of graphite are shown in the large surface a small quantity of the pure mineral will cover when rubbed. In virtue of this peculiarity the graphite paint is said to adhere more closely to the metal painted and to fill every small interstice, giving a smooth and perfect surface. Furthermore, the mineral is unaffected by heat or atmospheric changes and resists all corroding influences. The silica is added to give body and hardness to the mixture, and, as it is also unaffected by moisture and heat, it does not lower the quality of the paint. This paint has been used on roofs, bridges, smoke-stacks, etc., and is said to have given excellent satisfaction in all cases.—*Metal Worker.*

PROPOSED DRAINAGE REGULATIONS.—The following excellent regulations have been proposed for the city of Glasgow, Scotland: 1. The positions and sizes of all drains, pipes, cesspools, or traps, and all soil and rain-water pipes and conductors shall be shown distinctly upon the plans submitted, and the weights per foot of the lead or iron soil-pipes, conductors and cesspools be marked on the plans in figures. 2. Forty-eight hours' notice must be given to the Master of Works, at his office, previous to commencing the laying of any drains. The party giving the notice will receive a card of permission to open the street, which card will be held as proof of the notice having been given. 3. All connection between drains and the public sewer will be made by workmen of the statute labor department, and shall be paid for by the proprietor. 4. Every drain-pipe must have a uniform fall of not less than one inch to every lineal yard, and every pipe must be thoroughly packed and resting entirely on the solid earth. When the Master of Works deems it advisible, he shall require concrete foundations to be put under and around the drain-pipes. 5. The joints must be well cemented and all cement projecting on the inside must be removed. 6. Sufficient traps and ventilation must be provided for and fixed to the satisfaction of the Master of Works. 7. Before covering, all pipes must be inspected by the Master or his representative, and no junction connecting drain-pipes and plumber-work to be covered up until examined and passed by him. 8. The Master of Works to have the power to use the smoke-test on all drains and plumber-work before the building is occupied, and at any other time he may consider necessary, all expenses connected with the test to be paid by the owner of the property. 9. No dwelling shall be occupied until the Master of Works has given a certificate that the drains and cesspools, with traps, have been properly constructed, and the house otherwise fit for occupation. 10. Proprietors and contractors will give every assistance to the Master of Works, for the purpose of performing the necessary inspection.—*American Architect and Building News.*

No place more than San Francisco needs an intelligent, qualified "Master of Works," so named in the article above quoted, with powers to control all irregularities and violations of correct sanitary science and building construction, as defined and established by a commission or board of competent architects and civil and sanitary engineers. The villainous character of seven-tenths of the sewer work done in this city is simply fearful. Not three in ten, if three in twenty, of every foot laid prior to the enforcement of the Plumbing Law, being put in as it should be when intrusted to "sewer layers" upon their own knowledge and honor; nor is the evil fully remedied under the existing law, as the greater portion of the sewer work is still done by those who seldom, if ever, did a good job unless watched at every foot of pipe laid; and men who do well only when they are compelled to, will do badly whenever the opportunity is left to them.

Decay of Iron.

A PHENOMENON has been observed in the Callowhill-Street bridge in Philadelphia, which is of great interest to architects and engineers, although the tax-payers of Philadelphia probably take no satisfaction in it. A few days ago men were sent to repaint the girders of the bridge, and began, as a preliminary process, to scrape off the rust. The attention of the foreman was soon attracted by the unusual size and weight of the scales of rust which fell upon the railroad below, and, on picking some of them up, found that they were solid masses, from one-quarter to three-eighths of an inch in thickness. It is needless to say that plate-iron girders which had lost their substance by rust to such an extent as this would have little strength remaining, and the vibration of the bridge under the movement of a horse-car or loaded cart, which was so great as to compel the painters sitting on their swinging stage to cling to the ropes or the braces of the bridge to avoid being shaken off, indicated still further the necessity for an immediate inspection of the whole structure. The first examination was an informal one, made by persons living in the neighborhood, who found not only that some of the iron-work had been nearly eaten through by rust, but that the whole bridge, which is built on a steep rising grade, had moved down hill so far as to tear out the top courses of stone of the upper abutments, and to buckle the struts of the intermediate supports; while the movements of the roadway frame-work had cracked the asphalt over them, and forced out the paving-blocks between the horse-railway tracks. The bridge includes one span of three hundred and forty feet, and as there can be no trifling with girders of this length, extensive repairs will probably be necessary. The structure was only completed in 1875, so that ten years of neglect have sufficed to bring it nearly to destruction, and those who have to design important iron roofs or bridges will do well to notice by this example how short is the life of such works if not properly cared for. In the case of the Callowhill-Street bridge, the corrosion was probably hastened by the action of the smoke from the locomotives which passed under it; but there are hundreds of bridges exposed to the same action, and the iron roofs of railway stations and manufactories are often subjected to similar or more dangerous influences.

THE LARGEST APPLE TREE.—The largest apple tree in the country is said to be in the door-yard of Delos Hotchkiss, Cheshire, Conn. Its circumference is thirteen feet and eight inches. The girth of the largest limb is six feet and eight inches. It has eight branches; five bear one year and three the next; 110 bushels have been gathered in one year from the five branches. It is over 140 years old.

Indestructible Paint.

THE Paraffine Paint Company are offering a line of paint compound which is claimed to possess superior qualities, even over the best white lead and oil. It is recommended for a large range of purposes, with extraordinary preservative qualities, and as the best resistant of fire known; also, that it will not chip or peel off, is easily applied, and guaranteed to last twice as long as any other paint. It is strongly endorsed by many of the prominent manufacturing, mechanical, mill, railroad, and other establishments in California.

Commenting on the difference in wages received by plumbers in London and Chicago, a plumbing paper published in London states its belief that the English plumber, by emigrating to the States, will better himself and probably make it better for those whom he leaves behind, by removing his competition from the labor market in England. The reason why this view is held is because wages are so much higher here than in London, and because the plumber here is supposed to have a status in society, that is, expressing it as does the English paper, "they hold a very different position in the States from what they hold at home." As for the latter suggestion, a man's social position in the States does not so much depend upon his occupation, so long as it may be an honest one, as it does upon the character and attainments of the man himself. If he is intelligent and respectable enough to bear the burdens and perform the duties of society, he will receive as much as he is entitled to. He is not hampered by the ridiculous notions of aristocracy, as in England.

As to the question of wages, it is held that the purchasing power of money is greater in London than in the States, but the difference is not equal to the difference in wages. It has been estimated that a man may live one-third cheaper in London than here, but he certainly receives more than one-third higher wages here. The fact seems to be that, in England, the plumber is put upon the same footing as other lines of labor and paid accordingly, while here his labor is recognized as skilled and he is paid accordingly. There is another thing which must be recognized by the intending immigrant plumber. That is, that his trade as learned in England differs materially from the plumber's trade as practiced in the States, and an English plumber just arrived from his native country could hardly hope to receive equal pay with American journeymen.—*Sanitary News.*

One of the simplest and readiest ways of loosening a rusted screw is to apply heat to the head of the screw. A small bar or rod of iron, flat at the end, if reddened in the fire and applied for two or three minutes to the head of a rusty screw, will, as soon as it heats the screw, render its withdrawal as easy with the screw-driver as if it were only a recently inserted screw.

MASONS' AND BUILDERS' EXCHANGE
OF SAN FRANCISCO
Room 11, 314 Montgomery St.

BELOW will be found a list of the members composing this Exchange. Boxes are provided for each member, so that architects, owners, or others desiring the services of any particular member, or those having boxes who are not members, and yet whose business is directly connected with that of the Exchange, can readily secure the attendance of the party sought, by leaving a note in the respective boxes.

The minister last Sunday morning had preached a very long, parched sermon on the creation of man, and one little girl in the congregation was utterly worn out. After the services, she said to her mother: "Mamma, were we all made of dust?" "Certainly, my child." "The preacher, too?" "Of course. Why do you think he was not made like the rest of us?" "Oh, because he is so dry, mamma, I don't see how the Creator could make him stick together."

Where owners' names are left blank, it is so done in most instances by special request.

Temescal—Alterations. O., Jas. Eva; A., J. Marquis; day's work; $1,000.

Menlo Park—One-story frame. O., Episcopal Church; A., J. Marquis; day's work; $1,000.

Woodland—Two-story frame. O., Milton Enyard; C., W. H. Winne; $3,600. Walnut Street. One-story frame. O., Warren Hord; A., W. H. Carson; C., Glenn & White; $3,000. Sixth Street. One-story frame. Woodland Winery Association; capital for buildings and outfitting, $15,000. Main Street. Improvements on Woodland Planing Mill. O. and B., S. Caldwell; $1,000. Main Street. Two-story frame. Improvements. O., F. W. Brendel; C., Gammel & Boots; $1,000. North Street. One-story frame. O., M. Zirker; $1,000. Elm Street. Two-story frame mill. O. and B., Glenn & White; $4,500. North Street. One-story frame. O. & B., John Danniels; A., Gilbert & Son; $1,000.

Capay—One-story frame. O., P. Everett; day's work; $1,800.

Madison—One-story frame. O., M. Farlen; C., Amesbury & Davis; $1,000.

Yolo—One-story frame. O., Henry Kast; C., G. W. Cooper; $1,200.

Winters—One-story frame. O., W. J. Cannedy; $1,000.

EASTLAKE,

INDESTRUCTIBLE GLOSS PAINT,

Especially adapted to the climate of California.

Durable, Easy Working, Economical.

MIXED READY FOR USE AS PUT UP.

No turpentine, benzine, gum or rubber. Works as easy as if mixed with turpentine! Workmen speak well of it. In use in San Jose for three years.

Sun and Fog do not Destroy its Gloss, or Cause it to Chalk.

COLOR CARDS MAILED FREE ON APPLICATION,

To the EASTLAKE PAINT CO.,
190 SOUTH FIRST STREET, SAN JOSE, CAL.

Country Mechanics furnished with THE BEST OF TOOLS AT LOWEST PRICES

Address, CAL. ARCHITECT.

BLUM, EPPSTEIN & MARSH.

MANUFACTURERS OF

Inlaid Wood Flooring

WOODEN MANTELS,

Hard Wood Interiors.

Office and Parlors 126 Kearny St., 2nd Floor,
FACTORY 209-227 FELL ST.,
SAN FRANCISCO, - - CAL.

BUILDERS' HARDWARE.

Complete Assortment
House Trimmings,
INCLUDING
MALLORY, WHEELER & CO.'S
CELEBRATED
IMPERIAL BRONZE
Locks & Latches,
Light and Dark Shades,
Plain Antique, Tuscan,
Damascene or Berlin
BRONZE FINISH.
Unrivaled for Beauty of Design and Superior Workmanship.

ALSO A FULL LINE OF
COPPER
WEATHER VANES,
Locksmith & Bell Hangers' Supplies.
Union Spring Hinges
CABINET HARDWARE,
With a Full Line of
CARPENTERS'
AND
MACHINISTS'
TOOLS.

D. N. and C. A. HAWLEY, 501 to 507 Market St.

The California Architect and Building News.

VOLUME VI.
NUMBER 9.

SAN FRANCISCO, SEPTEMBER, 1885.

$2.00 per Annum, in Advance.
Single Copies, 20 Cents.

THE
CALIFORNIA ARCHITECT
AND
BUILDING NEWS.

PUBLISHED on the 15th of EACH MONTH
BY THE
San Francisco Architectural Publishing Co.,
240 MONTGOMERY ST., ROOMS 11, 12, 13.

TERMS.

Exchange, p. 160; Building Intelligence for September, pp. 160-162.

Our Building Reports.

OWING to unexpected interruptions in the management of this Journal, occurring in June last, which were not anticipated nor the contingency to any extent provided for, very naturally imposed temporary difficulty, which has required a little time and some effort to rectify and arrange; and, perhaps, some practically immaterial inaccuracies in figures in connection with the building reports have occurred. But these being now all overcome, from this issue and onward, the reports in this Journal may be relied upon as more nearly correct than can be found through any other source. Our annual report and summary will be prepared with every possible care, so as to show the transactions for the year as nearly perfect as unequaled facilities and earnest attention can make them.

Architects, contractors, builders, owners, and others will confer a great favor by furnishing the editor of this Journal with information upon points of error of any character, in whatever connection found, as we desire to have every item and every statement appearing in the columns of this Journal, scrupulously correct and reliable.

SUMMARY FOR SEPTEMBER.

118	New Frame Buildings	$509,050
8	" Brick "	73,550
43	" Alterations	163,590
169	buildings	$746,100

These figures show a considerable increase in building activities over the preceding month. A careful review for the twelve months may develop some inaccuracies, and if so, the necessary corrections will be made.

NOTICE.—*The name of this Journal having been used by parties not in any manner connected with this office, to obtain building intelligence and information intended for its columns, architects, contractors and others will hereafter please assure themselves before furnishing same, that the party canvassing is properly authorized to represent us. Authorized canvassers will be supplied with sufficient evidence upon this point.*

When stained glass windows are used in private houses, it should be remembered that the effect of the colored glass upon the light coming through it is to give to it its own tint, and should this chance to fall upon furniture, carpet, or wall, whose color, may be, is affected unpleasantly by that of the window, the result would be perpetually disagreeable. In churches, cathedrals, or public buildings, where colored windows are introduced, it will be noticed that their surroundings are plain, generally the stone or marble of the building.

The Present Building Outlook.

THERE is a singular anomaly in the present aspect of building activities. The general expressions in commercial and business circles is, "Times are exceedingly dull;" "business is poor;" "aren't clearing expenses," etc., yet the erection of buildings goes on as lively as might be expected under the most prosperous and active condition of general trade and commerce, with but little, if any apparent increase in the number of buildings to let. One year ago or more, it was generally regarded and stated that "building was being overdone," and that an early grand collapse was inevitable in this connection; still a monthly addition has been made since then, of about one hundred houses, representing well-nigh two hundred new places of abode, or homes for families, many of the contracts reported representing "flats" of two and three stories, and single buildings sometimes containing six or more family apartments. Still the number of unoccupied houses and tenements has increased but little, if any, and architects and builders continue to be busy, with but little signs of abatement.

Much new work is now in course of preparation in the offices of the architects, and a good fall business is assured. The low cost of material has and has had much to do with this state of things; but in addition to this the "common people,"—small traders, mechanics, laborers, and wage earners,—have, as a rule, accumulated and saved money sufficient to enable them to secure lots and improve them, and wisely, very many of them are pursuing the safer course of investing in real estate, rather than jeopardizing their earnings by investments in stocks and uncertain securities.

Notice to Correspondents, Subscribers, and Patrons of this Journal.

A CHANGE HAVING OCCURRED IN ITS MANAGEMENT, GEO. H. WOLFE RETIRING,

All Parties in Business Relations, Correspondent, Financial, and Otherwise,

WILL PLEASE HEREAFTER ADDRESS

JAMES E. WOLFE,
—OR—
Editor California Architect and Building News,
240 Montgomery St., S. F.,

For convenience sake, use only—CALIFORNIA ARCHITECT, 240 MONTGOMERY STREET, S. F., as that alone will ensure prompt delivery.

American Newspaper Annual.—A very comprehensive book, covering the whole ground of its specialties, 996 pages; practical, useful, well arranged, and neat in its typographical appearance. Published by N. W. Ayer & Son, Philadelphia. May be ordered through this office or direct from the publishers, at $3.00 per copy.

Discussion on the Mechanics' Lien Law.

THE subject of discussion before San Francisco Chapter of Architects at its special meeting held the 14th inst., was the Mechanics' Lien Law of the State of California.

Mr. T. A. Eisen led the discussion, in a review of the several sections of the law as amended at the last session of the Legislature of this State, pointing out its many defects, inconsistencies and illegalities, and showing up its inharmonies with well-known principles of common law, the law of contracts, and the decisions of the Supreme Court of California. Also exposing the private interests sought to be favored, on the part of those who at their own cost and expense employed a well-known "limb of the law" to concoct the amendments as passed, knowing that after passage the cruel thing could not be again amended until the next session of the law making body, and that during that period at least, some personal benefits might be derived, through the cumbersome and in some respects obscure working of the law as it stands, by which advantages may be taken of technicalities, and owners, rather than pay the cost of appeal to the supreme court, may be made to pay monies for which they could not be holden, under a fair and equitable statute, in keeping with the constructions and ethics of law as heretofore announced by the court of last resort, on former appeals. The views expressed by Mr. Eisen were indorsed by all the members present, and for the purpose of more fully considering the subject, its further discussion was continued, to be taken up at subsequent meetings of the chapter.

There cannot be any question as to the palpable illegality of some of the provisions. That compelling the *filing* of contracts with the county recorder is a violation of personal right, which will be set aside whenever that question is submitted for final decision. A contract is private property, an agreement between the parties of the first and second part, and it cannot be removed and held from the possession of the rightful owner by any process of law. Its *recording* might possibly be required, but it would be just as reasonable to say that no deed of trust, transfer, conveyance, etc., should be valid, unless *filed*—stowed away in the safe keeping of the officer of records. And the gentleman who framed that section not only doubted "*whether it would stick*," but knew that it was an extravagant stretch of legal tactics that would not be sustained when passed upon by the proper tribunal. But aside from this view of the section referred to, it is a most unnecessary provision, serving no good purpose—is impractical, because never availed of—and is troublesome and expensive.

The preposterousness of the proposition is shown by its practical application: for instance, an owner residing in San Francisco determines to erect a building costing over $1,000, in any county of the State, it may be the most distant from this center, and there being no planing mills, dealers in building materials, nor competent mechanics in that locality, as a matter of necessity all materials would be forwarded from San Francisco or some other place distant from the improvement contemplated; and the contractor as well must, and naturally would in such cases, be found in this city. So that every party in interest would be in San Francisco. But the law demands that before any work is commenced, or any material furnished, the contract must be *filed* with the county recorder of the county *in which the work is to be executed;* and unless so filed before commencement, the contract to become void, and all parties then to have recourse on the owner under the rule of day's work.

Consequently, if a building or other construction is contracted to be built in Sierra County, and the owner does not send the contract beyond his reach for filing in the county recorder's office, of the county named, his contract rights cease. And further, all parties furnishing material, etc., if they desire to examine the original contract which is the pretext upon which the obnoxious amendment is based, must go or send hundreds of miles from the place of his business to see the document, which in all reason should be in the owner's or his agent's possession, and a copy in the possession of the contractor. The concoction is an overreach which fails both in fairness and justice, and is useless to those perpetrating it, except so far as the "little joker" may in some cases prove the winning card, over the right and left bowers of right and justice; and it is questionable whether, while the arrangement holds, and subjects thousands of owners, architects, and contractors to the annoyances and expense of filing contracts, a single one of those who have been instrumental in imposing the hardship, or others in their line, will ever avail themselves of the protection proposed by the amendment.

The delay of thirty-five days after the completion of the building or works for the payment of the twenty-five per cent of contract money held for that period, is another foolish and oppressive provision. The argument that responsible contractors can afford to wait, is fallacious, for experience proves that the penniless scrubs can secure credit from material men which places them practically upon equal footing with the best. Consequently the good and bad can go on just the same, whether the monies of the contract are paid at completion or at any other deferred period; and the objectionable amendment or any other of like character fails to effect the purpose contemplated. But somebody must under the law be all the same kept out of monies due them for thirty-five days. As long as business facilities and favors are extended to the impecunious class of contractors, by material men, planing mills, etc., there will be a way found by them to practically nullify all enactments of character and intent such as that under review.

Science in Architecture.

[Written for this Journal by F. Hillert, architect and mechanical engineer.]

SCIENCE is the interpretation and knowledge of the laws of nature, and the forces governing the same. Man is commanded to investigate and use them for his moral and intellectual welfare, his health and material benefit.

Science has no nationality, but is the collective and aggregate accumulation of the intellectual work of men, both of the past and the present. Its information is extensive, and is found applied in all occupations of men—probably unknown to him—its singular laws governing not one but all of them. The study of the sciences and their investigations cannot be too much recommended.

SCIENCE ON HEAT AS APPLIED IN DOMESTIC ARCHITECTURE.

Heat is a power used for domestic purposes, for mechanical and industrial work. Heat produces work, and work can be converted to heat. Heat must be attached to a medium, and by the abstraction of the same therefrom, work is accomplished.

Heating is the judicious transmitting of heat to fluids or solid bodies; to the air for domestic warming purposes, to the changing of fluids to steam and vapors, to be used at the place of creation for the desired work, or to be conveyed hence to a more convenient place for the abstraction of its work. The necessary heat, therefore, is to be first created by the combustion—a chemical process of uniting the chemical elements of the fuel with oxide—developing heat and light—of fuel on or in a fire-place arranged to collect the heat created, and to admit the atmospheric air required therefor, and the product therefrom, as fire gases by natural or artificial current or draft to be conveyed off, so as not to become obnoxious to men and its surroundings.

The fuel used for home and industrial purposes is in general the wood fiber—a carboniferous hydrate—a combination of carbon with hydrogen and oxygen (H_2O) in the same proportion as in water.

Carbon and hydrogen are the heat-producing elements, oxygen and nitrogen the heat-absorbing elements. The first, therefore, gives the real value to the fuel.

Combustibility of fuel is the greater and smaller capacity by which the same can be ignited and made to continue to burn, requiring therefor a certain high temperature, and is dependent on the condition and composition of the same; fuel being porous and containing a large quantity of hydrogen, has a larger combustibility than fuel, being dense and containing a smaller amount of hydrogen.

The heat developed by the perfect combustion of fuel—the changing of the carbon and the hydrogen contained in it to carbonic acid (CO_2) or water (H_2O)—can be measured in a double relation: by the quantity of heat developed and the degree of temperature (intensity) produced.

Since for heat there is no certain measure

we must be satisfied to give the relative quantity of the same, that is, how much more—quantity—heat is developed from the one fuel than from the other. If the comparative values of heat are referred to the unit of volume, we obtain the specific effect of heat, but when referred to the unit of weight we obtain the absolute heat, or caloric. Both valuations are dependent on the composition of the fuel, the specific heat of the fire gases created by combustion, the outer condition of fuel, its degree of moisture, and the quantity of ashes left as residue.

The heat felt by the sense of feeling and measured by thermometer, does not give the same as quantity.

By actual measurement it has been found by perfect oxidation that

1 unit of weight of carbon heats 8,080 weights of water.

1 unit of weight of hydrogen, 34,462 weights of water.

From 0° (centidegree) to 1°; the comparative figures thus obtained we call "caloric," or units of heat. In the same way the effects of heat are obtained for

Carbon changed to acid of carbon	8,080 cal.
Carbon changed to oxide of carbon	2,474 "
Carbonic acid to acid of carbon	2,413 "
Fire-damp	13,063 "
Petroleum (raw), our future fuel, and now extensively used in Russia on the Black Sea and its tributary rivers for navigation purposes	11,773 "
Wood, air dry	3,600 "
Peat (loose) existing in the tule lands	3,000 "
" pressed	4,300 "
Coal (mineral)	6,000—8,000 "

To give an estimate, how much measurable heat is bound or lost and named "caloric," mix 1lb of ice with 1lb of water of 75° temperature, we obtain 2 lbs of water of 0° temperature, 75° of temperature having been consumed by melting of 1 lb of ice.

For hydrogen and its combinations in the fuel, the values given above do not give the exact effect of heat, a portion of the same developed by combustion is lost and used for the evaporation of the water produced; but in consideration that water (H_2O) is composed of 1 atom of hydrogen and 16 atoms (8 molecules) of oxygen, making 9 units of water, and that in CH_2 and C_2H_4 are contained respectively ¼ and 1-7 of hydrogen—and, further, 600 units of heat are required to change and evaporate 1 unit of water—we obtain the corrected effect of heat, namely:

For hydrogen	34,462— 9.600 = 29,062 cal.
For fire-damp	13,063—9·4.600 = 11,713 "
For olefiant	11,358—3·7.600 = 11,087 "

And in round numbers for future application:

Oxide of carbon	CO	2,400 cal.
Hydrogen gas	H	29,062 "
Fire damp	CH_2	11,710 "
Olefiant	C_2H_4	11,090 "
Butelyn	C_4H_8	10,840 "

The results for carbon are obtained from the solid carbon of the charcoal. The combustion of a denser constituted carbon furnishes smaller results: Coal from gas retorts, 8 017 cal.; coal from sugar, 8,040 cal.; natural graphite, 7,844 cal.; graphite from furnaces, 7,785 cal.; diamant, 7,770 cal.

The absolute effect of heat can be calculated by the amount of water evaporated, namely: One unit of weight of water changed to steam of 150° temperature require 652 caloric, hence:

1 unit of solid carbon, giving $\frac{8080}{652} = 12.4$ units of steam.

1 unit of hydrogen, giving $\frac{34462}{652} = 52.9$ " "

Chemistry is the science of exact quantities, and uses at her experiments, scales and weights, and when the component elements of the various fuels are known, quantitatively, the effect of heat of the fuel can be calculated from the effects of the components, namely:

Air-dry wood is composed of 0.39 C + O, 40 H_2O, 0.015 ashes and 0.195 water. The effect of heat can be calculated with the assistance of the formula for the effect of heat: 8,000 C + 29,060 H - 680 H_2O - 600 W. In serting the quantitative values of the elements we obtain the effect of heat: 8.000. 0.39 + 29 060. O - 680. 0.40 - 600. 0.195=2,731 cal.

FUEL.	C	H	H_2O chemical water.	Hygroscopical water.	Ashes.	Effect of 1 lb. Heat.
Air-dry wood	.39	..	0. 40	0.195	0.015	2,731
Air-dry peat	.35	0. 01	0. 29	0. 25	0. 10	2,743
Bituminous coal	.50	0.015	0.205	0. 20	0. 08	4,146
Mineral coal	.8	0. 04	0. 09	0. 13	0. 04	7,488
Charcoal	.8	1. 0	0. 03	0. 16	0. 05	7,034
Coke	.8	1.005	0.015	0. 15	0. 06	7,005

The effect of heat from gaseous fuel, which is more economical, and a better combustion can be obtained—can be found with more certainty—when the component elements are known.

One unit of this gaseous fuel contains: H units of hydrogen, CH_2 of fire-damp, C_2H_4 olefiant, C_4H_8 Butelyn, CO oxide of carbon, CO_2 acid of carbon, N nitrogen. Formulating a formula as above, the effect of heat will be: 29.060 H + 11,170. CH_2 + 11,090 C_2H_4 + 10,840. C_4H_4 + 2,400 CO. And for the different gases:

	H	CH_2	C_2H_4	C_4H_8	CO	CO_2	N	Effect of Heat
Of illuminating gas	0.05	0 54	0 10	0 08	0.15	....	0.08	11,113
Furnace gas from coal	0.01	0.04	0.02	....	0 22	0.05	0.50	1,509
Furnace gas fm charcl.	....	0 01	....	....	0 30	0.00	0.63	887
Furnace gas from coke	....	....	....	....	0 35	0.01	0.64	840
Generat'r g's from w-od	0.01	....	....	....	0.34	0.12	0.53	1,107
Generat'r g's from peat	0.01	....	....	....	0. 22	0.14	0.63	819

Generat'r g's from coke	....	....	....	....	0.34	0.01	0.65	816

Since the combustion of fuel is the chemical process of oxidation, taking the oxygen, therefore, from the abundant surrounding atmospheric air, which is a mechanical mixture, or diffusion of 77 parts of nitrogen and 23 parts of oxygen gas; and when the amount of atmospheric air required to burn 1 unit of fuel is $\frac{100}{23}$ times larger than the amount of oxygen consumed, and when the amount of the latter can be calculated from the known composition of the fuel, the atomical weight of carbon being 12, of hydrogen 1, of oxygen 16; when, further—1 unit of carbon and 1 unit of hydrogen is used for their change to acid of carbon and to water respectively $\frac{32}{12} = \frac{8}{3}$ and $\frac{8}{1}$ parts of oxide, than for 1 unit of fuel composed of C units of carbon, H units of free hydrogen, H_2O of chemical water, W units of hygroscopical water, and A units of ashes, we obtain the amount of atmospheric air required by $L = \frac{100}{23}(\frac{8}{3}C + 8H)$.

To obtain the amount and composition of the fire gases created from the burning of one unit of solid fuel, such as carbonic acid = Ac; units of water Aq; units of nitrogen and A units of ashes we form the formulas:—

$$Ac = \tfrac{11}{3} C; \; Aq = 9H + H_2O + W, \text{ and}$$
$$N = L + 1 - A - Ac - Aq.,$$

And for one unit of gaseous fuel, containing, besides nitrogen, H units of hydrogen, CH_2 units of fire-damp, C_2H_4 units of olefiant, C_4H_8 units of Butelyn, CO units of oxide of carbon, and CO_2 units of acid of carbon:—

$$L = \tfrac{100}{23}[8H + 4CH_2 + \tfrac{24}{7}(C_2H_4 + C_4H_8) + \tfrac{4}{7}CO.]$$

$$Ac = \tfrac{11}{4}\cdot CH_2 + \tfrac{22}{7}(C_2H_4 + C_4H_8) + \tfrac{11}{7}CO + CO_2.$$

$$Aq = 9H + \tfrac{9}{4}\cdot CH_2 + \tfrac{9}{7}(C_2H_4 + C_4H_8).$$

$$N \; L + 1 - Ac - Aq.$$

The atmospheric air required to burn up one unit of solid fuel is generally larger than L and equal up to 2 L and over, and can be set = m L, than will be the quantity of weight of the fire gases created from 1 unit of solid fuel fire gas = (m — 1) L + Ac + Aq + N.

If the mixture of the surplus of air, carbonic acid, nitrogen, and vapors (the moist containing in it) is of such a small quantity as not to bear any considerable effect on the state of condition of the fire gases. To investigate the action and condition of them in the fire channels and the smoke stacks, the density *d* and the specific heat *c* of the gas mixture must be known.

The density *d* of the mixture can be calculated from the density of its compounds; when

(m — 1) L units of surplus air = density = 1.
Ac = carbonic acid = 1.529.
Aq = vapors = 0.623.
N = nitrogen = 0.971.

Then the fire gas mixture will have a density of

$$d = \frac{G}{(m-1)L + \frac{Ac}{1.529} + \frac{Aq}{0.623} + \frac{N}{0.971}}$$

The specific heat of the fire gases could as easily be computed from the specific heat of the compounds, if the same, for instance for carbonic acid and vapors, for the different high temperatures would be constant, for they with sufficient correctness for all practical purposes would be set equal to 0.24.

$$c = \frac{0.24\,(G - Aq) + 0.48\,Aq}{G} = 0.24\,(1 + \frac{Aq}{G})$$

With the assistance of the above given formulas and the previous components of the different fuels given, the quantities of air necessary for a perfect combustion of one unit of solid fuel, the quantities and conditions of the fire gases can be computed, and are given in the next following table.

Mineral coal composed of 0.80 C, 0.04 H., 0.09 H_2O, 0.03 W., 0.04 A.

The amount of air required is:—

$L = \frac{100}{23} \cdot (\frac{8}{3} C + 8 H) = \frac{100}{23} \cdot (\frac{8}{3} \times 0.80 + 8\ 0.04) = 10.67.$

Carbonic acid gas = $Ac = \frac{11}{3} C = \frac{11}{3}\ 0.80 = 2.93.$

Vapors = $Aq = 9\ H + H_2O + W = 9 \times 0.04 + 0.09 + 0.03 = 0.48.$

Nitrogen = $N = L + 1 - A - Ac - Aq = 10.67 + 1 - 2.93 - 0.48 = 11.67 - 3.45 = 8.22.$

The density of the mixture is:—

$$d = \frac{G}{(m-1)\,L + \frac{Ac}{1.529} + \frac{Aq}{0.623} + \frac{N}{0.971}} = \frac{22}{(2-1)\,10.67 + \frac{2.93}{1.529} + \frac{0.48}{0.623} + \frac{8.22}{0.971}} = 1.022$$

The weight of the gas is: for m = 2.

$G = (m-1)\,L + Ac + Aq + N = 10.67 + 2.93 + 0.48 + 8.22 = 22.30.$

And the specific heat is:—

$$c = 0.24\,(1 + \frac{Aq}{G}) = 0.24\,(1 + \frac{0.48}{22.30}) = 0.245.$$

NAME OF FUEL.	Air required.	Air obtained.	Aq, AQ	Nitrogen	m = 1. G.	m = 1. d.	m = 1. c.	m = 2. G.	m = 2. d.	m = 2. c.

Quantities of air required for the perfect combustion of 1 unit of gaseous fuel, the quantities and conditions of the fire gases:—

GAS MIXTURE.	L.	Ac.	Ag.	N.	G.	d.	c.
Illuminating gas	14.19	2.29	1.90	11.00	15.19	0.957	0.270
Furnace gas from coal	1.39	0.67	0.21	2.01	2.89	1.016	0.258
Furnace gas from charcl	0.92	0.56	0.02	1.34	1.92	1.080	0.247
Furnace gas from coke	0.87	0.56	....	1 31	1.87	0.09	.242
Generator gas from wood	0.19	0.65	0 09	1 45	2.19	1.062	0 259
Generator gas from peat	0.89	0.49	0.09	1.31	1.89	1.042	0.250
Generator gas f'm char'l	0.84	0.54	....	1.30	1.84	1.087	0.241
Generator gas from coke	0.84	0.54	....	1.30	1.84	1.08	0.240

The temperature of the fire gases, or the intensity of the heat, could be readily calculated from the kind of fuel and the proportionate quantity of air used, if the combustion would be perfect, or, pro unit of the fuel used, the quantity of heat created could be applied for the increase of temperature of the fire gases, but such is not the case; then, a portion of the fuel falls into the ash-pit unconsumed, the loss of heat by heating of the fuel freshly given up, which is of a low temperature, by the loss of heat consumed for the evaporation of the hydroscopic water, and for heating of the cold air entering through the fire door into the fire-place; the existing heat becomes insufficient for the perfect combustion—the union of the carbon with hydrogen. The carbon, divided into small particles, enveloped by the vapors of the hygroscopic water, escapes and forms the black smoke after every new filling up of the fire grating with fuel; after the period of black smoke follows one of a lighter smoke, containing a smaller amount of solid carbon (sod), but considerable quantities of imperfectly burned gases, oxide of carbon, hydrocarbonic combination and hydrogen, occasioned by the insufficient air, or the imperfect mixture of the same with the distilled combustible gases. Further: from the heat produced, a portion of it is lost by radiation into the ash-pit and the surroundings of the fire-place. (The open fires and the fire-place used for warming the rooms of our houses are the most imperfect arrangement for combustion, as we only utilize the radiating heat from the fire-place and the back wall of the same.) We take the agreeability at the expense of the wasted fuel and it being fashionable. The ranges used for cooking do the same, only by radiation from the fire-place. A great saving of fuel may be and is had from the use of the continuous brick and lime kiln, etc.

T_5, the quantity of heat, in consideration of the losses and the imperfect combustion, of 1 unit of fuel developed for use = Y K; Y should be named the degree of effect of the fire, and S Y, K the amount of radiation against the direct and indirect heating surfaces, then is the temperature:

$$\frac{(1-5)\ Y\ K}{(m\ L + 1)\ c}$$

Assailable for the increase of the temperature of the products of combustion of 1 unit of fuel, wherein m L + 1 is the weight of the product and m L the weight of atmospheric air used, and c the specific heat of the same, and 5 is the proportion of the heat radiated towards the heated surface to the heat usefully developed. If we set m = 1, y = 1, s = 0, we find the highest possible temperature of the following named fuels (practically not obtainable) to be:

	degs.		degs.
Air-dry wood	1,860	Furnace gas from coal	2,032
Air-dry peat	1,892	" " from charcoal	1,801
Bituminous coal	2,211	" " from coke	1,872
Coal	2,565	Generator gas of wood	2,022
Charcoal	2,574	" " " of peat	1,726
Coke	2,593	" " " of charcoal	1,848
Illuminating gas	2,466	" " " of coke	1,848

For, technically, the most important fuel, the coal, we set the specific heat of the product of combustion = 0.25, and with K = 7,483 we obtain the temperature:

$$t = \frac{29{,}932\ (1-s)\ y}{10.67\ m + 1} = \begin{cases} 1{,}760\ (1-s)\ y, \text{ for m} = 1.5 \\ 1{,}340\ (1-s)\ y, \text{ for m} = 2 \end{cases}$$

To the temperature existing in the fire, room must be added for the temperature of the air admitted, and with gaseous fuel the temperature of the same, which is considerable.

The melting points of some of the different metals are from 1,000–2,500 degrees, and for their reduction require a high temperature, only to be obtained by the perfect combustion of the available fuel.

(To be continued.)

A New Sash-Lock Device.

DURING the past decade, sash-lock devices almost innumerable have been invented, patented, and placed on the market, some of them displaying a good degree of inventive and mechanical genius, and standing well in favor among architects and owners. The latest invention is

THE IVES' PATENT SASH-LOCK,

A device differing materially from all others, operating by cam combination, without any spring, and therefore not liable to get out of order. They are manufactured by Hobert B. Ives, New Haven, Conn., and on sale in this market by Huntington, Hopkins & Co., sole agents for the Pacific Coast. The cut shows

the peculiar shape of the lock. There are two motions of the handle, the first locking the sash, which leaves the handle at right angle with the meeting rail, and the second, by a cam movement, drawing the sash tightly together, and placing the handle parallel with the face of the sash. Until something still better is invented, they are likely to assume pre-eminence, and be the lock of the future. They are made of bronze nickel and all the lesser grades of metal, and at prices placing them in full competition with the best of makes.

There is a science, after all, in so simple a matter as driving a nail. A correspondent writes that he recently witnessed the experiment of driving nails into timber that had been hard seasoned and well dried. The first nails, after passing through an ordinary board, went into the timber about an inch and then doubled up under the hammer. The tips of the rest of the nails were dipped into lard, and the driving was accomplished without any difficulty. The remedy is not a new one, but it is simple enough to be recommended for trial.

S. F. Chapter of Architects.

A SPECIAL meeting of the chapter was held August 21, Vice-president Pissis presiding; the committee appointed at the previous regular meeting to nominate officers for the ensuing year, submitted their report, which was approved by vote of the Chapter. Other nominations were then added, after which the discussion of the Mechanics' Lien Law of the State of California was opened by T. A. Eisen, followed by expressions of disfavor from all present. (A partial review of the subject matter will be found in another column.)

The regular annual meeting was held Sept. 4, with a large attendance, Vice-president Pissis again presiding. The minutes of previous regular monthly, and the special meetings having been read, amended and approved, the report of the committee on apprenticeship indentures was presented, read and adopted, and 250 copies ordered printed for the use of the members of the Chapter. The trustees, committees on classes, investigating committees, etc., made their reports. Mr. W. A. Boring, of Los Angeles, was elected unanimously as a fellow of the Chapter. Other Chapter business being disposed of, and the election of officers for the ensuing year being next in order, the names of candidates for the respective offices were read by the secretary, and the balloting commenced with the following result: President, Wm. Curlett; Vice-president, T. A. Eisen; Secretary, B. E. Henricksen; Treasurer, Seth Babson; Trustees, Augustus Laver, G. H. Sanders, Thos. J. Welsh, J. B. Whittemore, and J. J. Clark.

The report of the retiring, and the installation of the newly elected officers will form the features of interest at the October meeting. The harmony and good feeling that characterized the proceedings, rendered the occasion pleasant.

The committee appointed some months ago, to review and report upon the "Fire Ordinances" of city and county of San Francisco, in which are also mixed up what should be distinctly and separately known as the "Building Laws"—not being prepared to report, the subject matter was commented upon by several of those present, expressing the opinion that the present fire ordinances might be materially changed and amended for the better, removing many of the objectionable features, both in the ordinances themselves, and the manner and character of interpretation and enforcement.

The lead covering of the dome of St. Peter's at Rome has lately been successfully renewed. The work has occupied twelve years, and has cost £8,000. Lead was imported from Spain for this special purpose, and was mixed with the old lead in the proportion of one part of the latter to two of the former. The total weight of the new covering is about 350 tons, and it is calculated that if laid in sheets, one-fifth of an inch in thickness, it would cover a space of above 70,000 square feet.

Profits and Losses on Building Contracts.

MOST people imagine that the profits from house building in California are large, and that contractors as a rule have made and are making "young fortunes" from their contracting successes; that they are a "well-to-do" class, with comfortable bank accounts to their credit, and ample cash on hand or at command. This to a limited extent is true, but in the main, a great error; yet a conclusion of this character is justified and reasonable, judged by the very large amount of money passing through their hands. Millions of dollars are yearly handled by them, and if a fair, right, and equitable percentage of profits were realized on all transactions, with but occasional loss to a few, the result would justify the presumption that those who build homes and structures for others, were also building and constructing the foundations for, if not the superstructures complete, of competency when age and whitened locks betray the period when active toils and labors should be laid aside for that rest and repose which should come to those who have spent the years of their earlier manhood in hard contests and business conflicts; and the heads and hands long pressed by the many cares, inflictions, and responsibilities which must be encountered during life's devotion to figuring, planning, calculating, managing, and close application to the innumerable demands upon the best energies of mind, intellect and body; should be freed from the necessities of continuing the struggle until the cords of life are stranded and the once active frame laid within the casket.

But the facts of the case do not sustain this presumption as a whole. Some few, and very few of the many thousands who have devoted themselves to house construction under contracts awarded in competition, have done fairly well, maintaining a good reputation for skill, competency, and prudent management, and consequent financial promptness. But the great majority, perhaps seven-tenths or more of the entire number, have gone on from year to year exhausting their time and energies, and the strength and vigor of their manhood, with no better profits to themselves than the mere subsistence gleaned from the monies handled—hundreds of them being compelled, through bad calculations and mismanagement, to defraud creditors by pro ratio settlements, or inflicting still greater wrong by absconding to parts unknown, carrying with them all within possible reach, leaving those who have trusted them to reap the full measure of absolute and total loss of all balances.

The proofs in this connection are numerous; and if the shortages, abscondings, and clean profits were footed up, and a truthful balance arrived at, it would be found that the sum of losses by material men, sub-contractors, and workmen, from and by reason of the blundering incompetency, ignorance, carelessness, and often premeditated wrecklessness and dishonesties of a very large number of men denominating themselves, and aping competency as contractors, would far exceed all the profits derived by those who have done well and paid their way, with something to show as the result of true efficiency, careful management, and business integrity.

HOW ARE THESE LOSSES PROVIDED FOR?

The question naturally intervenes, if all this be true, how do material men and other losers compensate and equalize these losses? The answer is simple and plain. *First*, the shortages, if the party paying short is actuated by any degree of honesty in the settlement, leaves him a pitiable, penniless object, with nothing but discredit if not absolute dishonor in his disastrous undertaking; a practical business fool, having agreed and undertaken to do an impossible thing, *i. e.*, fixing a false value upon a something to be done, and agreeing to do it for a less sum than actual cost, thus exhausting himself—time, means, and energies—and, without their consent, prospectively involving other parties in the results of his personal stupidity, and himself a bankrupt or a rogue. *Secondly*, as a matter of course, material men and others, knowing these facts, must of necessity compensate these losses, by increase of prices to good paying, honest parties. It cannot be otherwise; for if the right, fair, and reasonable profits on merchandise, and crude or manufactured materials is twenty per cent, with no margin for excesses, the twenty per cent must and will be preserved when possible. And with the fact in view that in the natural order of things losses to an average amount of five to ten per cent are sure to occur, the contingencies must be and are provided for by increase charges all around, sufficient to make the average result what it should be. So that while the advance is charged to all, the excesses paid barely compensate for the shortages, and leave the seller whole with his legitimate profits. But those who cause this state of things—the tenth rate contracting frauds—are left penniless; unless by scheming tricks and absolute, practical dishonest purpose and design, they pocket monies rightfully belonging to others, under the dishonorable pretext that they are entitled to pay for their services, let who may suffer. And the disposition manifested in a majority of these cases is a don't-care-ativeness as to who is hurt, with no sense of shame for the state of things existing. The base consolation that "plenty of others have done the same thing," seems to satisfy, and wipe out all consideration of any wrong having been done.

An English lockmaker has constructed a key which he says is capable of opening 22,600 patent lever locks, all of which differ in their wards or combinations. As described, the key weighs three ounces, is nickel plated, and is said to be the result of three years' labor on the part of the inventor in making drawings of different wards and combinations.

White Lead and Its Substitutes.

THERE has been much written about this leaden subject, and as the metal is of large production, its consumption is increasing in volume, we may venture a few logical suggestions about its manipulation by the corroders of white lead. In speaking of lead when acted upon chemically, we must speak of the acids as formed and the acetates in many of its compounds. The old Dutch process is now admitted to be the best method of corroding pure metallic lead, namely: After the lead has been corroded in the form of thin sheets laid over pots containing acetic acid, the carbonated portion of these sheets is separated and ground in a bath of water to free it from acetic acid, and if so done the white lead will be found in the form of a compound of hydrate and carbonate, as one to two as named; and when ground in about twelve per cent of linseed oil, to the proper grade of fineness, it is then run into packages and branded as the pure white lead of commerce. Now, if the foregoing process is not carefully done the result will be too much acetate of lead combined with the carbonate for a free, limpid, working lead. In such cases the lead is found to be lumpy, or drying solidly *en masse*, if kept in store for any lengthy period. The acetate, or sugar of lead, is a good dryer, and for that reason should be all taken out, so that the carbonate and hydrate will form a smooth, soft paste of lead.

The "stencil" mark of *pure white lead* is a misnomer, as there is no lead in packages but what bears the mark of pure lead. No person can tell whether the lead is pure without the maker's name is attached to certify to the contents. As there are large quantities of these fictitious brands (*no name*) sold in our markets, the buyers should beware of pure white lead that has only a *brand* to recommend it. The intentional impurities of white lead are very numerous. The Kremnitz White, or Flake White, are among the purest found in any market. In Europe there is the Venice, which is composed half and half, one part sulphate baryta and one of white lead. Then there is the Hamburg White, which has only one-third pure white lead, and the remainder is made up of sulphate of baryta. The Dutch White is only its inferior by having only one-fourth white lead and three-fourths, by weight, of sulphate of baryta. What is this baryta? It is only one of the simple earths, called by Bergman *terra ponderosa*, or heavy spar. The mineral is reduced by a chemical process to a heavy white powder, not very opaque in body, and hence its employment in adulterating white leads which have great body or covering qualities. What has been said of those foreign brands is largely improved upon in the United States, for they beat the Dutch so bad that there is scarcely left a trace of white lead in some of the fancy brands which read "25 lbs. Pure White Lead."

The competition between manufacturers is so great, with large trade influences, that *vast* quantities of inferior brands of white lead are sold at so low a rate that the better brands of pure white lead, which sell for a slight advance in price, are limited in sale to the better class of painters. This is the true state of the case. While we have lead mines all over the Western States by the thousand, capable of producing millions of tons of pure ore, our American white lead manufacturers import cargoes of baryta and make up fraudulent brands of *pure* white lead and continue to impose upon a long-suffering public for the almighty dollar. One of the consequences of this system of manufacture has led to the birth and growth of a twin evil to the trade, and that is the making of ready-mixed paints, canned goods in all colors of dope, hermetically sealed in tin, good in any climate. In most cases these infallible mixtures are free from pure lead, being adulterated with the heavy-weighted baryta, not to improve their color or purity, but to give bulk and weight and less in quality. There are hundreds of factories in the United States that have their own peculiar mixtures, all warranted to be superior to any other, in having fine color and a durable gloss that will outwear any other brand of mixed paint. Thus it will be seen, that to afford capital an opportunity to make its investments profitable the *substitutes* must have their day. But the trade, house, sign and carriage painters, must educate the young apprentice to know what pure white lead will do, and the technical uses of pure pigments of every grade, and thus protect the trade from these abuses.

Architectural Competitions.

IF there is anything connected with the practice of architecture more fruitful of corruption and scandal than competitions we have yet to discover it. A recent sensation is reported from El Paso, Texas, where there was a competition a year ago for a Court House and jail, to which twenty-five architects, so-called, responded. One came in person all the way from Chicago only to see the prize captured by a San Antonio rival. After the usual difficulties with competition, drawings, making changes, supplying omissions, etc., the work was let somewhat informally for the sum of $135,000. The jail was finished last March, and the Court House was ostensibly progressing properly when a disagreement with a subcontractor led to charges before the grand jury and to a series of ineffectual attempts to secure an investigation, which has compromised the standing of a judge and other county officials, and produced great excitement among the taxpayers. Indignation meetings have been held, funds subscribed to force an inquiry, and the commissioners who had repeatedly evaded the charges were compelled to give them a hearing.—*The Inland Architect and Builder.*

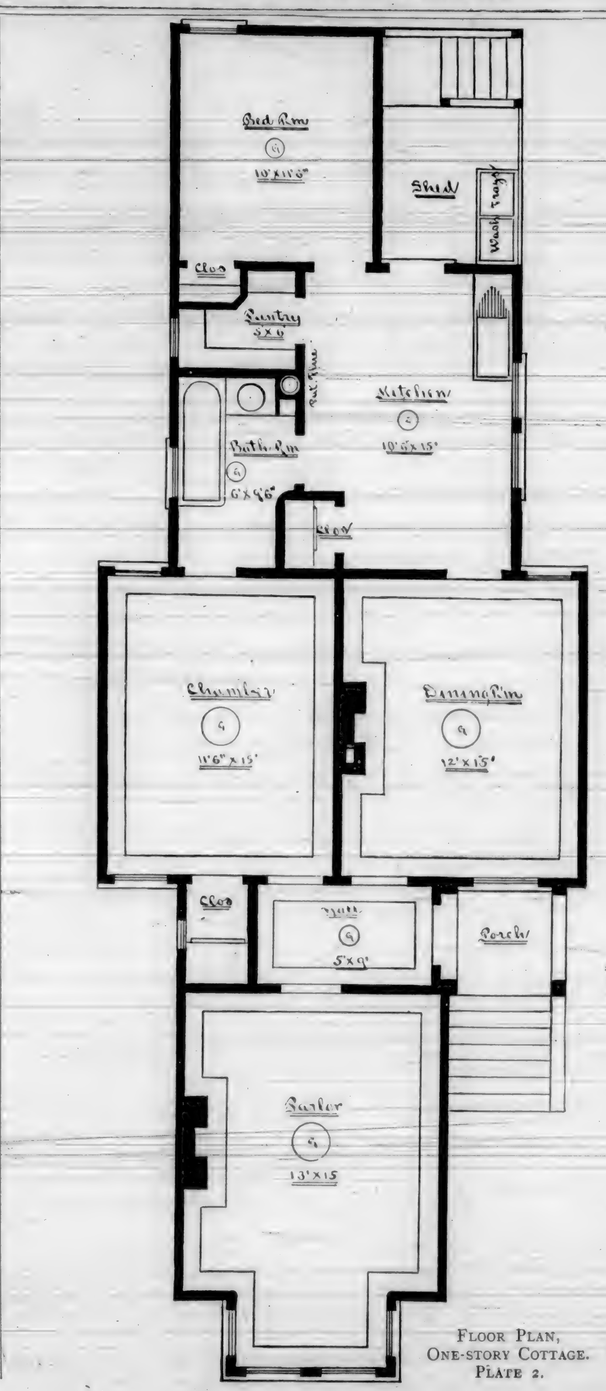
Our Illustrations.

CUTS Nos. 3 and 4, a moderate cost cottage for country, with a total of nine rooms, bathroom, halls, closets, pantries, etc., as shown by the plans. It can be built for about $3,500, according to the economies practiced.

Cuts Nos. 1 and 2, elevation and plan of one-story cottage with five rooms, bathroom, closets etc., can be built at a cost of $2,000 and upward. The space above ceiling of main story will permit the making of four loft rooms, by placing suitable windows in the respective gables.

Queer Origin of Words.

THE word "pamphlet" is derived from the name of a Greek authoress, Pamphylia, who compiled a history of the world into 35 little books. "Punch and Judy" is a contraction from Pontius and Judas. It is a relic of an old "miracle play," in which the actors were Pontius Pilate and Judas Iscariot. "Bigot" is from Visigotha, in which the fierce and intolerant Arianism of the Visigoth conquerors of Spain is handed down to infamy. "Humbug" is from Hamburg; "a piece of Hamburg news" was in Germany a proverbial expression of false political rumors. "Gauze" derives its name from Gaza, where it was first made. "Tabby cat" is all unconscious that her name is derived from Atab, a famous street in Bagdad, inhabited by the manufacturers of silken stuffs called atabi or taffety, the wavy markings of the watered silks resembling pussy's coat. "Old Scratch" is the demon Skratti, who still survives in the superstitions of northern Europe. "Old Nick" is none other than Niker, the dangerous water demon of Scandinavian legend. The lemon takes its name from the city of Lima.



FLOOR PLAN, ONE-STORY COTTAGE. PLATE 2.

Knights of Pythias in San Francisco—Their Prospective New Castle Hall.

A PUBLIC meeting of the members of the order was held in B. B. Hall, Eddy Street, August 31, for the purpose of enlisting a more general interest on the part of the members in the movement now on foot to raise, by sale of capital stock of the Hall Association, the necessary funds to begin at an early day the erection of a

NEW CASTLE HALL,

Large and commodious, and in every way suited to the wants and necessities of the order, not only as providing lodge rooms for the valiant knights in San Francisco, but a grand head quarters—a home where the membership universal on this coast, personally and collectively, may repair and enjoy all the benefits and advantages to be derived from fraternal intercourse and fellowship.

The lot is an eligible one, fronting 77 feet along the northerly side of McAllister Street, opposite the Hall of Records, by a depth of 137 feet 6 inches. It has increased in value a hundred per cent during the past few years, and the property in time will rank among the most valuable in the city, off from the great main streets, which will forever command and hold pre-eminence.

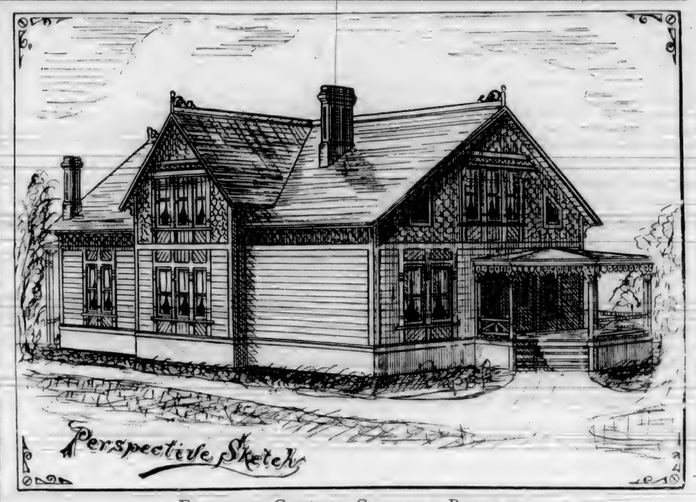
An incorporate Hall Association has been organized, composed of intelligent, capable, and honorable members of the order, who are working hard to set in practical operation, measures calculated to consummate the desired end. The capital stock of the Association is fixed at $100.000, divided into ten thousand shares of the par value of $10 each. The lodges in San Francisco have already taken well on to $20,000 worth of the stock, which sum will be materially increased from the same sources as necessity requires. The enterprise is one that should not and will not be allowed to fail of success, as it presents many inducements to both lodges, as such, and individual members personally, to become shareholders.

AS AN ORDER MOVEMENT,

With a view to securing and owning meeting-rooms for its lodges and associating therewith in the shape of a grand assembly hall, library, chess room, drill room, and all the modern conveniences and comforts known in connection with buildings of this character, it commends itself to most favorable consideration; and,

AS A BUSINESS PROPOSITION,

It is an investment that should meet a hearty response from every member of the order, as its incomes and profits are assured from its inception, by rental from lodges under Pythian jurisdiction, in addition to large prospective receipts from its grand assembly hall, from organizations other than Knights of Pythias, and other incomes that have crowned the successes of other orders less numerous in membership, who have secured to themselves buildings of their own.



ELEVATION COUNTRY COTTAGE.—PLATE 3.

An interesting review of prospective cost and income was given by P. C., T. F. Bachelder, who was followed by G. C., Geo. B. Katzenstein, P. G. C., John H. Harney and W. H. Bodfish, and by P. C., A. K. Stevens, James Patterson, F. H. Farrar, Dr. N. J. Bird, and others. The assemblage was not numerically as great as was hoped for, but this was made up by the hearty enthusiasm and interest manifested by those present, and the individual subscriptions to the capital stock.

The importance of the matter being more than local, it is expected that every lodge of the order within the jurisdiction, and every member who can afford it, will aid the enterprise by becoming shareholders.

Building Report—Woodland, Yolo County.

DURING the past three months, mechanics generally have been well employed, and material dealers fairly busy, the only drawback experience being a scarcity of coin, as three-fourths of the building business is conducted here on a cash basis. The prosperities have been such that no one should feel discouraged should there be less work done during the remaining months of the year. Still there are a number of first-class buildings and improvements on the prospective state, for early commencement, and good reasons to anticipate a good ending and showing for 1885.

The list of building improvements of all classes for the third quarter of the year is as follows:—

CITY OF WOODLAND.

35 Frame buildings, value	$102,000
3 Alterations and repairs, value	3,000
38 buildings	$105,000

YOLO COUNTY.

16 Frame buildings, value	$30,875
4 Brick buildings, value	25,000
20 buildings	$55,875
A total for the third quarter of 1885, of	$160,875
Corresponding periods in 1884, 29 buildings and improvements of the value of	97,400
Gain for 1885 over 1884 of	$63,475

In the preparation and prosecution of the figuring, the services of architects are fully up to, if not greater than any previous time, thus demonstrating the fact that our people intend to build wisely and well, observing true and correct taste and principles. Many of the cities and towns in this State are noted for the good judgment, refinement, and æsthetic taste displayed by owners, architecturally and otherwise, in the improvement of their property—a most commendable ambition, which should be practiced in all cases. Good judgment should never be influenced by bad examples, nor inconsistencies and incongruities accepted and duplicated, because other have so far erred as to practice abominations in the name of architectural science. Architecture is susceptible of almost endless treatment and variation, and any community of people may beautify their surroundings, by the exercise of good judgment, and the adoption of styles in buildings calculated to incite and inspire sentiments of admiration. In this view of the case, all artisans and mechanics should be careful in the style and character of the work presented by them for public criticism, so that it may reflect credit and prove worthy of imitation by others. Crowded Out—Exchanges—Future Enlargement.

THE quantity of original matter appearing in present issue, has crowded out a number of valuable articles from the columns of several of our highly-esteemed, and ably edited and conducted exchanges. To meet this condition of things, and provide for the utilization of the vast volume of interesting matter received monthly, through the piles of Eastern and foreign contemporaries, arrangements are being perfected by which this journal,

IN JANUARY, 1886, WILL BE GREATLY ENLARGED AND IMPROVED,

Giving much greater space for both reading matter and advertisements. A number of able and intelligent, scientific and mechanical writers and correspondents will be added to its staff editorial, and nothing that personal devotion and means can accomplish, will be left undone, to place it still higher in public esteem and confidence, and render it a journal of still greater reputation and merit. To this end, we ask the hearty co-operation of every present patron and subscriber, in assisting to

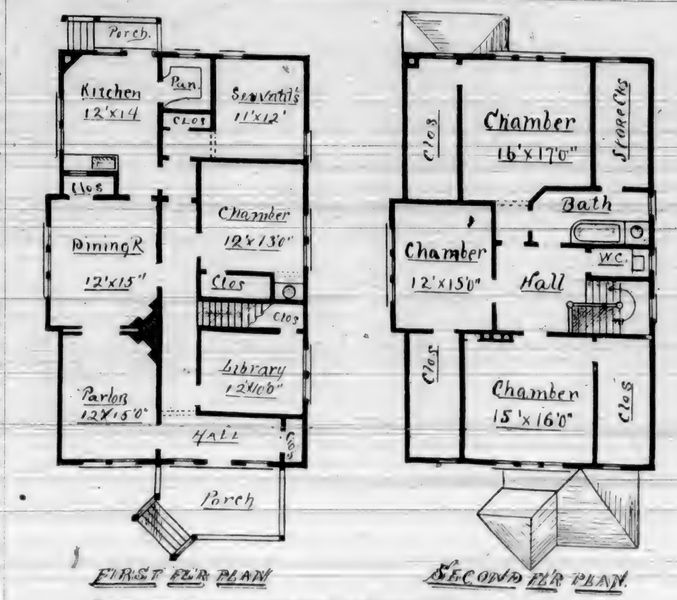
INCREASE ITS SUBSCRIPTION LIST.

Every new, and renewed subscription gives encouragement; encouragement stimulates ambition; ambition, effort; and well-directed, intelligent effort never fails of accomplishing the end and purpose aimed at.

THE BLACK DIAMOND.—The first number of the first volume of a new monthly journal, bearing the above title, is before us, edited by T. I. Jervis and H. A. Bischoff, with C. W. Collins as manager. It is published in Chicago. Very neat, clear, and readable in typographical execution, and its columns well filled with matter interesting to the general reader, as well as to those specially interested in the coal interests, to which it is particularly devoted. We bid it good speed and prosperity, and welcome it to our already plethoric exchange list, and hope the number of its subscribers on the Pacific Coast may be large. Our hand, brothers, hoping that while the base of the interest you represent is black, smutty, and not to be handled with white kid gloves, your success may ever be bright and cheerful, and never smoky, even though you may have to replenish the fires of your ambition with earnest effort.

A verdict has recently been given by an English jury, which is of considerable interest. The tenant of a house in Croydon brought an action against his landlord for damages resulting from the death of his wife, from diseases caused, he claimed, by defects in the drainage and plumbing. The lady had possessed an income of $5,000 a year, which "died with her," and for this substantial loss the husband asked compensation.

He showed that he had rented the house on representations of the landlord that it was in perfect sanitary condition, and that its plumbing and drainage had been done under the supervision of the Croydon Local Authority, But the state of the house was bad, sewer-gas escaped from the joints of the soil-pipe and from a broken trap, and a drain in the rear of the house was stopped. Before the death of the wife, the cook, the gardener, and the step-son of the plaintiff were ill. The landlord showed that he had reason to believe at the time that his representations about the condition of the house were true, as the local authority of Croydon had inspected the house, which was a new one, and had not found fault with any arrangements. But the jury, nevertheless, found for the plaintiff, awarding him $10,000 for the damages sustained in the loss of his wife, and $1,140 additional for expenses which he had incurred by reason of the insanitary arrangements.



FIRST AND SECOND FLOOR PLAN OF COUNTRY COTTAGE.—PLATE 4.

In a circular issued by the Board of Health of Bridgeport, Conn., the following directions about diet and cleanliness in cholera seasons are given: "As regards special precautions against cholera, great care should be used in the matter of food and drink. Wholesome meats and vegetables, and ripe fruits, may be used freely; in fact the free use of acids in fruit or otherwise is supposed to act as a preventive. But under no circumstances should any decayed or stale vegetables, unripe fruit, or tainted meat be allowed to be sold or used. The liability of water in the wells to become polluted by the contents of sewers and vaults, even if placed at a distance from them, should forbid the use of well-water for drinking purposes in all thickly settled places. Indeed, during a time of threatened cholera no water should be drank until it has first been boiled to destroy germs. It may afterwards be cooled by placing in contact with ice, but not by the addition of ice. Milk should be boiled before using for the same reason. The use of cathartic medicines should be entirely avoided except under the advice of a physician."—*Sanitary Engineer.*

In no part of economy are we divorced from wire. It is our slave, and an ever-present master. Sleeping, we repose on wire mattresses. Eating, we see food which has passed through sieves, and which is sheltered from insect appetite by wire covers. Calling, we pull wires to ring curled wire gongs. Traveling, we are conveyed by cable or electric railways, hoisted by elevators hung on wires and hurried over wire bridges. We announce our coming by telegraph or telephone wires, and we tread our way by night through streets lighted by means of electric cables. Across our fields are strung thousands of miles of barbed wire. Our clocks are set by wires, our watches run by wires, our books are stitched by wires, our pictures hung by wires, and our politics managed by wires. Forty years ago there was not a telegraph office in existence. To-day they number over 60,000. Ten years ago the telephone was not in existence. To-day there are 330,000 in use in the United States alone.—*Electrical Review.*

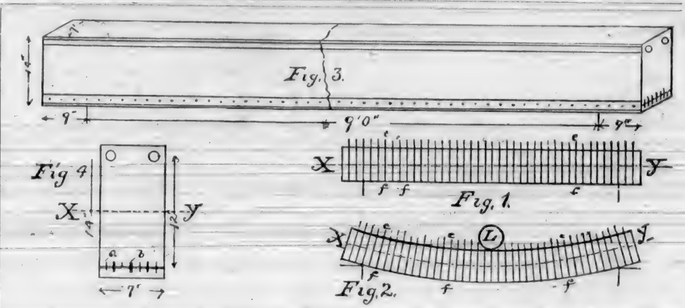
Concrete.

AN interesting experiment was made on the 31st of August in the presence of several architects and scientific gentlemen at the Industrial Iron Works, No. 233 Beale Street, by Mr. P. H. Jackson, to demonstrate the strength of a Portland cement-concrete beam combined with iron of a kind invented by Mr. Thaddeus Hyatt and largely experimented on in London, in 1876. One of the objects of the invention is that they may be used in part as beams or girders to support sidewalks, floors of buildings, as well as walls, etc. The advantage claimed by the construction is that the sidewalk, floor, or wall aids in its own support, in furnishing all the compressive resistance requisite in the part usual above the neutral axis of a beam. The concrete-combined-with-iron part of the beam is cemented to the bottom part of the wall or sidewalk to be sustained, and is required to furnish only the tensile strength, or that part of a beam below the neutral axis.

These concrete beams or girders are straight and are made of Portland cement and gravel, and with a small quantity of iron or steel bars built on the bottom of the concrete body, sufficient to resist the tensile strain due to the load, the sidewalk or wall to be supported to which it is cemented, furnishing the remaining part of the beam or girder above the neutral axis in resisting compressive force. These bars may be of any shape with their surfaces roughened, corrugated, serrated, or other than a regular surface to hold on to the surrounding cement and prevent its slipping or sliding when under strain. Trials have proved that smooth bars with their ends fastened pulled through. These bars may be either singly or in combination; the latter are threaded to each other by ¼-inch round rods, the width of the beam, passing through their centers, which stiffens the structure in its width. Also the concrete beam may be separately employed in resisting compression as well as tension, performing the entire function common to all beams. One of this kind was the subject of the trial. In this case the iron or steel ties furnish the tensile strength to that part of the Portland cement-concrete which is comparatively very weak in resisting tension below the neutral axis, to balance the strong compressive-resisting property of this material above the neutral axis. In General Gilmore's work on the strength of artificial stone he found by experiment that a mixture of 1 volume of Portland cement to 2 volumes of sand the ratio of the crushing to the tensile strength will generally be found between the limits of 14 to 1 and 19 to 1. With cement 1 and sand 4 it reaches as high as 25 to 1 and 29 to 1. With cement 1 and sand 5, as high as 35 to 1.

An explanation of the forces exerted on a single b am is as follows: When a straight beam or girder is subjected to a bending stress, it becomes more or less curved, by virtue of which the lower part is lengthened and the



upper part shortened in proportion to the depth of the beam and the difference in length between the radii of the curves. Were the beam made of horizontal layers the effect of the stress would be to cause these to slide one upon the other, but the beam being solid, the particles are held together by their own cohesion, the shearing strains being thus opposed by the cohesive force. The primary strains in the beam on the lines of compression and extension being upon curved lines, the disturbed particles must of necessity tend to arrange themselves in harmony with the radial lines of circles, all below the neutral axis seeking extension and all above compression. An illustration referring to figure 1 represents the side view of a straight beam or structure to be subjected to transverse strain when loaded and resting on end supports, the line $x\ y$ representing the neutral axis when loaded, being the dividing line between where the compression force ceases and the tensile strain begins, the greatest force and strain being at the extremes from the neutral axis. The imaginary vertical lines are at right angles with the bottom of the beam. The distance from any two of the lines at the top from e to e is the same as from f to f at the bottom. The length of the beam at top and bottom is equal.

Figure 2 represents figure 1 subjected to severe bending stress curved by the load L, which has caused great deflection. The vertical imaginary lines e, f in figure 1 have become radial lines in figure 2, radiating from a center to the curve of the bottom of the beam. The distance from f to f at the bottom of the beam in figure 2 is greater than in figure 1, the thrust force causing the disturbed particles to extend the greatest at the bottom, and gradually diminishing up to the neutral axis where it ceases, and from there the compressive force begins and gradually increases till the top surface is reached, which is the greatest, and the distance from e to e has shortened, the neutral axis line $x\ y$, being the original length of the beam, providing the two opposite forces have been equal in resistance. It is evident that when the beam is loaded and the imaginary lines e, f are held in their vertical position and not become radial lines, there can be no deflection of the beam, and its integrity remains intact. Mr. Hyatt, knowing the great compressive-resisting strength of Portland cement, and the great disparity in its comparative feeble tensile resistance, united iron or steel in such a way as to bind them to the weak part of the concrete body, in resisting separation along the bottom of the beam or structure, so as to furnish all the tensile strength needed below the neutral axis to balance the great compressive resistance above the neutral axis. The beam in question tested at the Industrial Iron Works, had iron longitudinal bars connected together by small cross rods and in the manner that the places of juncture would be at equal distances as represented by the vertical lines at $f\ f$, as in figure 1, which in this instance was 3 inches centers as shown by the dots at the bottom of figure 3. These cross rods were ½-inch diameter as shown in figure 4, representing them passing through the 7 vertical bars, thereby holding the concrete to the beam every 3 inches in the manner of the vertical line at $f\ f$, figure 1.

Referring to figure 3 is a longitudinal view of the beam tested. Figure 4 is a cross section, 7 inches wide, 14 inches deep, 10 feet 6 inches long. Distance between supports, 9 feet, $x\ y$ representing the neutral axes. At ½ inch up from the bottom was built in 3 of ¼x1 inch and 4 ⅛x1 inch wrought bars, extending the length of the beam, and at every 3 inches ¼ inch round iron rods extended through these 7 bars, some as shown in cross section figure 4 and longitudinally as in figure 3. The total weight of the wrought iron was but 46½ pounds; this resisted the tensile strains until the beam was broken. The area of cross sections of these wrought iron ties to resist the tensile strain of the beam, after deducting the holes for the ¼ inch rods, is less than a bar of wrought iron 1 inch square, or the bottom flange of a wrought iron beam 8 inches wide by ½ inch thick.

Without due consideration, Mr. Jackson informs me, larger pieces of cast iron, as shown in figure 3 near its top, were used than the necessity of the case required to make up in compressive resistance what the beam above the neutral axis might be deficient in, hence are larger than required. These were 2 of ¾-inch diameter cast iron rope mouldings built in near the top, weighed 36 pounds; the compressive resistance of cast iron is 93,000 pounds per square inch. The beam was five months old.

The load was of pig iron, piled uniformly over the length of the beam, ending in a line over the inside of the supports.

When 20,695 lbs. had been laid on		deflection 1-16 in.
15½ tons	30,989 lbs	3-32 "
	33,589 "	⅛ "
	35,703 "

25 "	50,054 "	15-16 "
26 "	52,062 "	1⅛ "
	52,692 "	1 3-16 "
26 8-10 "	53,654 "	brake by separation.

The pig iron was closely piled, and was 7 feet 6 inches above the beam.

The broken beam is now in front of 231 First Street. The gentlemen present exhibited great interest in the great strength of the construction, and when it is considered that this construction is called upon to act a part of half a beam, when supporting brick or cement work, the part to be supported acting in one-half of its own support, the invention may prove of great value.

The great strength of this beam, being but 7 inches wide, and considering the compressive resistance of the cast iron acting relatively to the wrought bars below, makes the distance in height but 12 inches. (See figure 3.) Therefore, computing the strength of this compared to a wrought-iron beam, of an area of bottom flange equally the area of all the ties in the concrete beam, we have as the breaking distributed load: —

$$\frac{1 \text{ in. area of bottom} \times 12 \times 160}{9 \times 12} = 17\tfrac{8}{10} \text{ gross tons.}$$

Or $19\frac{9}{10}$ net tons. Excess of this concrete combined with iron beam over a wrought iron beam computed by the formula is 7 tons, or above one-third. This may be attributed to the solidity of the Hyatt beam compared to the web of a wrought iron beam, which is subject to lateral deflection, also from the punched rivet holes weakening the iron, and from what other causes is a subject for consideration.

Symmetry of line came in place of the extravagant contours which had prevailed, resulting in an inspiring transformation, the influence of which has been felt in all succeeding times. Even now, with the many combinations of styles in this most fruitful period of art, the Louis XVI. style receives in furniture, architectural woodwork and mural decoration very full recognition. There is an abundance of detail in present styles of ornamentation, more probably than at any former period, but there are abundant evidences that so far as simplicity of general aspect can be combined with rich and graceful elegance, designers, guided in part by advanced public tastes, will not be found wanting.—*Exchange.*

The Architect.

OF all professional men the architect should have the broadest and deepest knowledge—that is if we are to judge by the standards of the past.

Pythius, in his commentaries, the oldest work on architecture that we have any record of, says "that an architect should have that perfect knowledge of each art and science which is not even acquired by the professors of any one in particular."

Vitruvius tells us that an architect "should be a good writer, a skillful draughtsman, versed in geometry and optics, expert at figures, acquainted with history, informed on the principles of natural and moral philosophy, somewhat of a musician, not ignorant of the sciences both of law and physic," etc.

The great Hindu authority, "The Maushyalaya Chandica," gives it as a law that "an architect should be conversant *in all* sciences; ever attentive to his avocation; of an unblemished character."

One thing is true, that all those who intend to follow architecture as a profession should pass through some solid and rational system of instruction—drawing, geometry, motives, materials, and the machinal skill necessary to use them; "a philosophical study of the history of architecture in its relation to various phases of civilization," the causes of its development or decline, etc. The moral side should also be taught—more particularly the personal responsibility of the architect. Unless something of this kind is done we cannot hope to have able and skillful architects.—*Art and Decoration.*

IN Chicago, the cry of the people for open spaces and parks has not become so intensified as it is in London, or even in New York. Yet there is pending an action in the city council which threatens to hasten the time when this cry will be bitter enough. The lake-front park is a magnificent open space, directly facing the lake in what will soon be the busiest section of the city. An effort is being made to secure the opening of streets in this park, and an ordinance is ordered drawn up for the purpose. This is but the entering wedge which it is expected will secure this valuable land for commercial purposes. It is a great mistake. The commercial interests of Chicago should be made to pay something for the hygienic influence which the preservation of this park will exert in the future.—*The Sanitary News.*

The ancient city Smyrna, now called Ismir, the only city on the western coast of Asia Minor, which has prospered, commercially, from the time of its foundation by Alexander the Great to the present, has always been defective in sewerage. Through an oversight of its architect, no provision was made for sewers, and the effects were so pronounced fifteen hundred years ago that Strabo speaks of them in his writings. The city has always been the seat of pestilence and plague.

Present Taste in Decoration.

THE general abandonment of wainscoting is all in favor of a more effective display of furniture. The beautifully patterned styles of wall paper now supplied ordinarily in subdued tones and neutral tints, with no one color unduly predominating, make, when judiciously chosen, a more effective background than one partly of wood and partly of paper. This and the fact that wainscoting is a sort of walling up, has driven it out.

The selection of the tone and pattern of paper may be properly made with reference to the intended hue and tone of the furniture and of the carpet. No arbitrary rules can be laid down in this matter. A general harmony, however, is quite consistent with strong contrasts, only these contrasts demand greater art to manage than closely analagous colors. In carpets, for instance, we now see admirable patterns in which a light field is traversed by bright and dark bands; so also in upholstery textile coverings of chairs, sofas, lounges, and fauteuils. The truth is that improved taste has set in against tameness; more inspiriting effects than mere neutral colors themselves will yield are looked for. Hence the abundance of gilded and colored metal ornaments in all sorts of quaint forms, which it is now the fashion to introduce, brilliant coloring extends even to lamp-shades, in some of which mosaic colored glass is introduced; in others, opalescent hues.—*Art and Decoration.*

The competition for the new Chamber of Commerce in Cincinnati, which has just been decided, presents several points of interest. Its general character, the high reputation of the architects invited to compete, the universal excellence of the designs submitted, and the final decision of the committee, all mark it as a great advance on methods formerly in vogue in competitions for public work. In issuing their invitations, the real estate committee of the Chamber of Commerce, composed of gentlemen of unimpeachable integrity and standing, selected six representative architects, whom they offered to pay about what sketches necessary for a fair presentation of designs for the building would cost. The original circular from the committee reserved for them the rights, first to retain as their property all plans presented, and second, to pay the successful architect $2,000, and employ another man to make working drawings and complete the building. These two clauses the committee, in response to strong representations from Mr. Richardson, and Burnham & Root, finally modified, specially agreeing to return all plans except the one premiated, to use no features peculiar to any one of these designs, and virtually conceding that the architect presenting the accepted design should be chosen to finish the drawings and superintend the building.—*The Inland Architect and Builder.*

Abominations of the Back Yard.

MANY back yards are abominations to the eye and nose. One finds in them all sorts of litter and refuse from oyster cans to old boots. Here the slops of the kitchen are poured to increase the odors which ought to warn every thoughtful person of the malarial influence breeding there, to break out eventually in fevers or diphtheria. If any member of the family dies from one of these diseases, his death is probably lamented as a "mysterious dispensation of Providence;" but the minister would say if he were to visit the back yard, that death was caused solely by a violation of hygienic laws. A very strong argument against a dirty back yard, is the spirit of deception which it is apt to foster in the young members of the family, for it is a constant deceit to present a clean and attractive front yard to the gaze of the passers, while the back yard is not fit to be seen. Children should be taught to be clean for the sake of cleanliness, and not because outsiders are likely to criticise them. The best plan is to have a hogshead or large box fitted up in one corner of the yard, and make it a rule to throw into this old cans, boots, broken dishes, and all such rubbish, and when there is a great accumulation, to bury or burn it. Do not allow anything to be thrown about. Have drains made to convey all slops entirely from the house. Make good walks, and let the ground have a fine covering of grass, not weeds. Put up strong supports for the clothes line. Keep the fence in repair, and plant currant bushes near it. Set vines about the refuse barrel, and train them over it until it is hidden. If you have a receptacle for ashes, let it be something which can be shut up, not a row of old barrels to offend the eye, and give out a cloud of ashes every time the wind blows. Make it a rule to have the back yard at all times as clean as the front one.—*Eben E. Rexford, in American Agriculturist.*

Solar Heat.

THE light's intensity at the sun's surface is 190,000 times that of a candle flame, 5,309 times that of metal in a Bessemer converter, 146 times that of a calcium light, or three-fourths times that of an electric arc. The temperature, according to Rosette, is about 18,000 degrees Fahrenheit. The mechanical equivalent of the solar radiation, continuously acting, is nearly 10,000 horse power per square foot of solar surface.

The tallest chimney in the world is that of the Towneley Works at Port Dundas, near Glasgow, Scotland, which is built of brick and stone, and is 454 feet in height. It is circular in form. The highest stone chimney is octagonal in form, and stands 381 feet in the air, and is located in Halifax, England. In Rouen, France, there is an iron chimney 279 feet high, which was riveted together and afterwards lifted into place with a crane.

Large quantities of timber are now creosoted, in a special manner, for railroad purposes, the effect being to increase the tenacity of the wood for holding spikes, &c., as well as its density, and its ability to resist mechanical wear. This is done by means of an apparatus consisting of a boiler-plate cylinder, of a size adapted to the timber; this cylinder is of a strength sufficient to resist 300 pounds pressure per square inch, and has a track extending for its whole length along the bottom, the cylinder's ends being closed by strong iron doors, air and water tight. When the timber has been run into the cylinder and the doors closed, steam at about 100 pounds pressure is injected into the cylinder, the supply continuing as required by the nature and dryness of the wood; the steam is then shut off, and vacuum pumps are worked as long as any liquids or vapors are obtained, the hot preserving liquid being now run to the cylinder from the reservoir until full. The force pumps are again operated until the interior pressure is some 100 pounds per inch, and kept thus until sufficient preservative fluid is forced into the pores of the wood; the force pumps are now shut off and the creosote oil or other liquid contained in the cylinder is discharged into a suitable cistern, after which the doors at the ends of the cylinder are opened, and the car carrying the timber or ties run out.—*Wood-Worker.*

"Talking about funny things," said a big, bronzed, bearded man in the reading-room of an up-town hotel the other night, "the funniest thing I ever heard of happened in my sawmill out in Michigan. We used a heavy upright saw for sawing heavy timber. One day not long ago the men had all gone to dinner, leaving the saw, which ran by water power, going at full speed. While we were away a big black bear came into the mill and went nosing around. The saw caught his fur and twitched him a little. Bruin didn't like this for a cent, so he turned around and fetched the saw a lick with his paw. Result: a badly cut paw. A blow with the other paw followed, and it was also cut. The bear was by this time aroused to a perfect fury, and, rushing at the saw, caught it in his grasp and gave it a tremendous hug. It was his last hug, and we lived on bear steaks for a week. When we came up from dinner there was half a bear on each side of the saw, which was going ahead as nicely as though it had never seen a bear. This is a fact, so help me, Bob," and the big lumberman bit off a fresh chew of tobacco.—*N. Y. Tribune.*

It is reported that Boston will soon have an opportunity to see the practical workings of the electric railway system on one of her streets. A line is being laid on Huntington Avenue in connection with the Metropolitan street-car line. If it works satisfactorily there, after a thorough test, it will probably be adopted on some one or more of the roads in Boston.

Disintegration of Building Stone.

THE sandstone commercially known as free-stone, which is extensively used for building purposes in American cities, is subject to disintegration from the action of the sulphurous acid produced by the consumption of coal and from frost. There is much difference in the ability of various quarries to withstand these destructive influences. The outer surfaces of some buildings in New York and Philadelphia have been, by the advice of an eminent chemist, treated with a mixture of paraffine and carbolic acid with apparently good results. The flat surfaces are warmed by means of a stove like a plumber's stove, but with a flat side, and the paraffine when applied in a melted condition penetrates the stone readily, it is said in some instances to the depth of 1½ inches. Mouldings and carved work are heated by means of a blast flame from India-rubber bags of illuminating gas. Another process has been suggested, but the preliminary results do not appear to be of a satisfactory nature on account of its tendency to crack. In this process the mixture used is an artificial stone and consists of three parts glass sand, three parts broken marble, two parts anhydrous clay, and two parts freshly slaked lime still warm. After a coat of the above has been applied wash it with water the following day. The central portion and wings of the Capitol Building at Washington were originally built of freestone, which disintegrated so rapidly as to threaten the permanence of the structure, and the whole was protected by several coats of white paint. The wings afterwards added to the above, and now used for the House of Representatives and Senate Chamber, are built of white marble, which conforms in color to the central portion of the building, so that the whole building appears to be made of marble.—*Mechanical News.*

The "Sanitary News" has often urged the sanitary examination of school buildings during vacation. To give force to its own opinion it now desires to quote the words of Mr. William Paul Gerhard, an eminent sanitary engineer. In a recent article on school and college sanitation, he says: "The annual vacation term would seem to be a particularly fit time to undertake a sanitary inspection of the school-buildings, of their interior construction, sanitary arrangements, and of their immediate surroundings." He calls attention to the absolute necessity of such a periodical inspection, by qualified persons, and the correction of such structural and sanitary defects as may be discovered. While the water supply, drainage, and ventilation should be examined into, it is necessary to demonstrate the entire absence of dampness, and to examine the methods of lighting the class rooms, of heating the building, the means of egrees in case of fire, the arrangement of seats and desks, and finally into the plumbing appliances.

Treads and Risers..... $ .50

Architects Get Their Fees by Sueing.

ANOTHER architect in England has had to sue his client to get his poor pay with the usual result. In this case, which is known as Taylor & Locke *vs.* Greene & Son, the plaintiffs, composing a firm of architects, brought suit to recover $2,250, the balance due them for services in preparing plans and drawings, with other professional work, for the rebuilding of a certain business structure. The defendants in resisting this claim, brought forward the usual tale of woe, to the effect that among other things, the architects had not sufficiently considered or warned them about the claims of neighboring owners in regard to light and air, and that through this neglect disputes had arisen between the defendants and their neighbors, involving the former in expenses amounting to $18,000, which, as they claimed, the architects ought to pay. The reply of the architects to this was simply that they had been engaged to do the work of architects, under the instructions of the defendants, and that they had done this, and nothing more. Although the trial lasted seven days, and a great deal of evidence was brought forward, the jury seems to have retained through the whole the view of the matter that juries generally take, and promptly returned a verdict for the plaintiffs for $1,900 and costs. So far as we can judge from the brief but clear account which we find in the *Builder*, this seems to have been one of those cases where a man, having engaged a young or over-amiable architect to do a certain piece of professional work, imagines that he has a claim upon his time and services to any extent, and for any purpose, and keeps him trotting about, investigating, negotiating, and inquiring in regard to matters which do not come at all within an architect's province, however convenient it may be for the architect's employer to have him busy himself about them without charge; and after getting all the work out of him that he can, avails himself of all the disappointments that he may have experienced in the results of the errands which he has persuaded the architect to do for him to cut down the pay due him for his legitimate services. There are plenty of such men in the world, and plenty of architects who suffer from them, but the number of the latter would be smaller, if the younger members of the profession fully understood how little respect a court accords to any pretext whatever for depriving a man of any part of the money which he has earned by reasonably skillful and faithful services in his own vocation.—*American Architect and Building News.*

Durability of White Lead.

WHY is it that white lead does not wear as well as it used to? is a question that is frequently asked by painters and consumers. They also add: We used to be able to obtain an article that would wear for years, while now its durability is much less. The important reason for this is found in the difference between the methods of manufacture employed now and a few years ago. Formerly, white lead was corroded by immersing it in vinegar acidulated with acetic acid, which is only concentrated vinegar. The process required about eight weeks before the carbonate was ready for use. This process, however, was found too costly, and the production was too limited to supply the demands. Then, too, a process requiring so long a time would compel corroders to invest a large capital from which they could realize no returns for a long period. They could not afford to produce lead in this manner at a cost sufficiently low to meet the demand for a low-priced article. Accordingly their ingenuity was taxed to invent some method whereby the carbonate could be produced much quicker and at a much less price. Thus they adopted the present process whereby the lead is now corroded by means of a stronger acid in a month, or even in a few days. The result is that the pure article is much less durable when applied to buildings. Speed in the manufacture of some articles, it is true, does not sacrifice quality, while in others the greater celerity in manufacture the less durable the products. Not only is this seen in the production of lead, but another branch of manufacture where it is especially noticeable is that of leather. Formerly it required fifteen months to thoroughly tan a hide. Now the process has been shortened and a month and a half at the longest witnesses the completion of the work. As in the case of white lead, the result is lack of durability, and people constantly complain that leather soon cracks out and lacks its original durability.—*P., in the Painter.*

Painting Ironwork.

THE point of prime importance, says the *Painters' Magazine*, is the actual condition of the surface when ready to receive the first coat. Upon this point rests the success or non-success of subsequent applications, for if not in proper condition no paint will prove permanently preservative. Now the best state is that where there has been formed upon the surface of the iron a film of black oxide which has been, while hot, thoroughly permeated by and incorporated with a resinous or tarry covering. This covering insures perfect success, and its thickness may be increased from time to time by additional coats of paint. If, however, a layer of hydrated oxide (ordinary rust) be once allowed to form, the successive coats of paint will fall off, their separation from the iron being merely a question of time. During the time, also, the rust has been spreading under the paint. An instance of this may be seen after outdoor riveted work has been in place for some time. Usually all the riveting is done before the final painting is begun, each rivet-head, in the meantime, being exposed to a damp atmosphere; the paint begins to peel off the rivet-heads long before it leaves the adjacent plates, and, when this occurs, nothing but thorough scraping will give the paint a chance to adhere again. So slight are the differences of manipulation which determine whether a given piece of work shall or shall not rust away, that they may all be found in the different methods of manufacture pursued now and formerly.

Taking the case of a piece of ornamental ironwork, which in so many instances has come down to us in unimpaired beauty and condition, it would now, probably, be forged in detail in one part of a factory, drilled, filed and fitted in another, and when completely finished, be painted in three coats of best oil paint. Formerly the smith who forged the work punched the necessary holes at the same time, fitted his various pieces together as he went on, completing each piece as he proceeded, doing all the work with his hammer, and, to quote an old book of directions to good smiths, brushing his work over with linseed oil and suspending it for some time over a strongly smoking wood fire. This will give at once a sort of elastic enamel coat, perfectly adherent and calculated to preserve the iron to the utmost. Of course ironwork to-day is not made to undergo any such preparatory process, and the consequence is that we find it very difficult to produce good results in painting on iron surfaces. But it is pretty well established that the very best finish coat for iron is found in red lead, upon which any desired shade of lead paint may be placed with the best possible results.

EXCAVATIONS AT OLYMPIA.—The excavations at Olympia are to be recommenced immediately under the auspices of the Archæological Society of Athens. On these excavations the German Government has expended so far a million marks, £20,000 more than is generally supposed, the sums voted by the Reichstag and granted by the Emperor having been supplemented at a later date by a large bequest from an unknown quarter in Berlin. It is declared by those best qualified to judge, that two-thirds of the site of Olympia still remain to be excavated. The Germans themselves, however, seem to be glad to have done with the work, as they have cleared out the principal parts where the richest harvest of *trouvailles* was expected, while nationally they have derived very little profit from the undertaking. They think they made a great mistake in stipulating only for duplicates of what they found, as of course no important objects existed in duplicate. They fancy that nothing of any great artistic value can now be found in the vast area of the Stadium or in the other outlying structures; but the Greek society has determined to clear away the vast mass of superincumbent earth, and to bring back the whole site to the original level, so that the lines of ancient Olympia may be clearly discerned. The local museum, the gift of a patriotic Greek gentleman, is a large building now roofed over, and is being plastered. In a few months it will be ready for the reception of the statues and bronzes already found.—*Athenæum.*

A Grand Monument.

NO ONE laughs now at the Washington monument. The day of its being a subject for ridicule is over forever. It is the wonder of Washington, and its beauty the admiration of both Americans and foreigners. It rises from the banks of the Potomac, a great, white marble shaft, piercing the clouds and backed against the blue of the sky. It is the grandest obelisk the world has ever seen, and in the eons of the future, should the nations of to-day pass away, leaving no more records of their progress than the mighty ones of the Egyptian past, it will surpass the pyramids in the wonder of its construction. It is higher than the third pyramid. It is taller than St. Paul's Cathedral. To-day the cathedral of Cologne—512 feet high—is the tallest work in the world; next comes the great pyramid, 483 feet high; then the Strasburg Cathedral, 473 feet; then the second pyramid, 453; then St. Peter's, 430; St. Steven's at Vienna, 443; and St. Paul's at London, 384. The monument is 555 feet high, forty-three feet higher than the Cathedral at Cologne. It will be far different, however, from the needle-like shafts of the great European cathedral, each of its sides at the top being thirty-five feet in width, and the whole massive tower seems a solid growth of natural rock, rising from the earth and reaching to the sky. The width at the base of each of its four sides is fifty-five feet, the monument gradually tapering for over five hundred feet, until it becomes a pyramid, each side of which is thirty-five feet.

Our indefatigable American cousins are constantly finding out something new and useful, or making improvements on past inventions, thought to be already at their best. The latest thing is an improvement in acoustics, by means of wood. We learn that a telephone has just been brought to this country from America which is based upon entirely new principles, being absolutely independent of electricity, so that batteries, coils, and cells are quite dispensed with. This obviously greatly simplifies the working of the instrument, and in the "mechanical telephone," which was subjected to a severe test on Saturday last, simplicity and distinctness are claimed as its chief characteristics. The instrument consists of a diaphragm, or sounding-board, made of strips of willow-wood, which has been found by experiment to possess a remarkable sensitiveness to sound vibrations. These strips of wood are closely woven together and varnished. In the center of the diaphragm a small disk of metal is placed, from which the wire proceeds to any point desired up to two miles. In Saturday's trials the instrument freely answered to all demands upon it, the ticking of a watch, musical sounds, whispering, etc., being heard with great distinctness.—*Timber Trades Journal, London.*

Cumming's Details $6.00
Cutting Tools 1.50

THE Brooklyn *Real Estate Review*, in discussing the question of low bids and poor work, makes the excellent suggestion that the contractor should be awarded the work whose cost estimate comes the nearest to the average of all the bidders. The center of difference between competitors would seem to be the proper point on which to weigh the probability of poor work on the one hand against unreasonable charge on the other, and would be the most removed from the danger of either. An average price would certainly induce a belief that a living profit could be made on an average quality of work, which is all that can be expected in a competition for trade. The complaint has always been that the work is generally below the average in quality, while the price asked really pays for nothing better.

The simplest principles of reasoning would seem to teach that results not in accord with the causes that produce them should not be expected, and if bad work follows as a regular sequence of poor pay, there is nothing so very astonishing in the fact.

The remedy suggested above lies with the contractors themselves, and is the only alternative that presents itself. If they would agree with each other, and give the public to understand, that no competition would be entered into unless on this basis of award, the now much abused system of letting by inviting competition would be productive of some good, at least, to all concerned. Every contractor would be compelled to hold up his end by doing a grade of work for which he was justly paid, or go out of business, and the old excuse to his conscience and customer that the work was "good enough for the money," would have no validity or foundation in truth.

It is difficult to convince some business men that it pays to advertise. They have tried it, they say, and it did not pay them. These men expect too much; they place an advertisement in a journal for two or three insertions and if they do not get orders enough from its insertion to pay them a profit on its cost, they arrive at the conclusion that it has not paid them. They do not take into account the indirect benefits that they may derive without being able to trace them to their source. The principle of advertising is to keep your name before the trade, and to call attention from time to time to the new goods that you have for sale. The liberal advertiser is always a live business man; customers know this, and naturally go where they think the most exertion is being made to sell goods.—*Furniture Worker.*

The natural gas vein which was struck some time ago at Gardenville, near Buffalo, N. Y., while boring for salt, continues to attract attention. The gas is said to be of good quality and shoots up to a height of about fifteen feet. There is talk of forming a company to utilize the well by laying pipes to Buffalo, a distance of about twelve miles.

The Pine Lumber Supply.

HOW LONG will this wonderful work among the pines continue? The stock of pine yet standing in Michigan can produce 40,000,000,000 feet of lumber if cut for the purpose. In eight years, therefore, at the last average production of the State, the pine will have been used up. But such predictions have been made for years past. In 1867, the standing pine of Michigan was estimated to be 52,416,000,000 feet, and it was predicted that it would all be gone in seventeen years. But since then the Saginaw Valley alone has produced about 12,000,000,000 feet, and will continue to cut in the neighborhood of 1,000,000,000 feet a year for eight or ten years to come. As pine grows scarcer, it will make more lumber than when it was plenty.

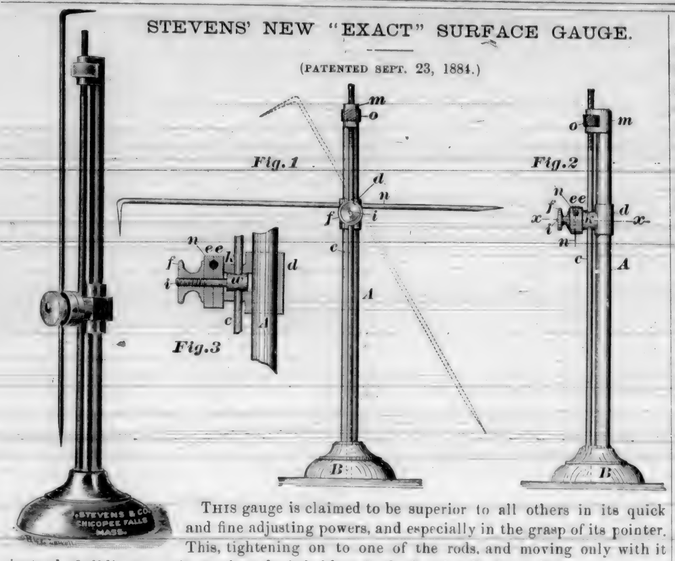
But, in predicting the end of pine lumber, a person must take into account the lumber which is yet standing in Wisconsin, Minnesota, Canada, and the South. And it will be many years before it even grows scarce, when we estimate the whole. Yet an end must come to the forests that the white race found in this country. Doubtless pine forests of the second growth will be raised for future use, but the present magnificent forests will disappear. It has been estimated that the demand for lumber in this country from 1880 to 1890 would require 210,000,000,000 feet, and one can readily see that at that rate the stock must soon be gone.—*Chicago Current.*

The large Royal Theater at Munich, Germany, is now lighted by electricity, the lights used being more than 1,400 Edison incandescent lamps, each of sixteen candle power. The auditory is lighted by a central chandelier containing 140 lamps, which took the place of a luster with 240 gas-jets. The different galleries are, moreover, illuminated by 84 lamps, equally distributed in front of the boxes. The stage is fitted up with 610 incandescent lights, while 566 more lamps are placed in the dressing-rooms, offices, storage-rooms, etc. The current is furnished by six large Edison dynamos, located in an engine-house, placed about 400 feet away from the theater, and underground wires are used for the transmission of the current. In order to avoid the annoyance to the eyes of the glaring light, all audience lights, as well as those in the halls and reception rooms, are encased in glass bulbs, the glass of which is rendered opaque by applying to it a caustic solution. The latter arrangement is much to be commended, and forms an important step forward in the successful practice of lighting buildings by electricity.

The City Council of Litchfield, Ill., Aug. 21, granted L. C. Van Vleck the exclusive right of supplying the city with natural gas for twenty-five years. Natural gas has been found just outside the city limits in large quantities at a depth of about 507 feet, and it is proposed to utilize this in lighting the city. The work of laying the mains is to be commenced at once.

STEVENS' NEW "EXACT" SURFACE GAUGE.

(PATENTED SEPT. 23, 1884.)



THIS gauge is claimed to be superior to all others in its quick and fine adjusting powers, and especially in the grasp of its pointer. This, tightening on to one of the rods, and moving only with it instead of sliding upon it as others do, is held perfectly firm in all of its adjustments.

In this tool the post *A* is rigidly fastened to the base *B* in the usual manner. At the top of the post is the nut guide *m*, for nut *O*. The adjusting rod *c* is guided at the top in a hole through *m*, and at the bottom in a hole in the base *B*. By means of the nut *O* the rod and attached parts can be adjusted vertically.

The support *d* is made with a branch *k*, through which the rod *c* passes. This branch is recessed to receive the cylindrical head *w*, of clamp screw *i*. The rod *c* passes through head *w* and branch *k*.

The pointer *n* is held between two clamps, *e*, *e*, as clearly represented. This permits of turning the pointer and clamps on the screw *i*, and of binding the whole by means of nut *f*.

It will be understood that the mechanism carrying the pointer can, when the nut *f* is loosed, be readily moved up or down the post, that when the nut *f* is tightened, it clamps this mechanism to the rod *c*, but that by turning nut *O*, the pointer can be adjusted a short distance up or down to bring it to the exact position required, after it is otherwise securely clamped.

The advantages of providing for this adjustment will be apparent to those accustomed to use such tools.

By having a hole drilled in the base, it is also adapted to a depth gauge and various other purposes.

SMALL SIZE.

The basis is of cast iron, round, and turned true with the upright spindle. The total height is eight inches, and will scratch eight inches sideways and thirteen inches high. The cast steel needle is pointed at each end, one of which ends is bent to a right angle. All parts are polished and accurately fitted.

LARGE SIZE.

Same, only weight is two pounds, and arm will scratch ten and a half inches sideways, and eighteen inches high.

These points, together with its simplicity, as shown by the cut, make it a most desirable tool for practical mechanics.

These surface gauges are made by J. Stevens & Co., the well-known manufacturers of fine machinists' tools, Chicopee Falls, Mass. They are for sale by

DUNHAM, CARRIGAN & CO.,

Nos. 17 and 19 Beale Street, and Nos. 18, 20, 22, 24 Main Street, who carry not only a full line of these gauges, but also a complete stock of fine machinists' tools, and light, dark, and antique bronze hardware. Orders also taken for gold, silver, nickel, and enameled work in all colors.

"PRACTICAL ESTIMATOR."—A neat little book of 96 pages, published by David Williams, New York, is full of instructions, tables, and suggestions for the use of contractors and all parties figuring on buildings and constructive works. While its contents may not be in every particular adapted to this section of country, owing to the differences in methods and materials as between this and the Eastern States, they, and the blanks referred to in this connection, will be found most excellent safeguards against the omission and oversight of items of cost. A very large proportion of the ruinously low bids submitted in competitions that end in pro ratio settlements, are the result of careless figuring, the neglect to include costs and expenses which are sure to occur. The book and blanks under notice are excellent reminders of every detail in figuring, and should be in the hands of every contractor.

"The 'Handy Estimate Blanks' have been prepared with an idea of furnishing to contractors and builders a convenient form upon which to make estimates and record the cost of the work which they execute. Two general divisions of work are recognized, namely, 'Masonry' and 'Carpentry.' Under each of these heads subdivisions are indicated, which include all the parts of the work required to complete any ordinary structure. In the column rulings there is a space for 'Estimated Quantities,' one for 'Prices,' and then a space for extensions, entitled 'Estimated Cost.' Outside of these rulings there is another set of columns, entitled 'Actual Quantities,' 'Actual Price,' and 'Actual Cost.' This arrangement affords a convenient system of comparison between estimated cost and actual cost, not only upon an entire job, but also upon any particular portion of a contract. The arrangement is such that each individual part of a building may be figured independently of all the others as to cost and allowances and profits, or all may be taken together and a single entry made for the allowances and profits. Materials are figured independently of the labor required to put them in place, the latter being separately listed in each division. In addition to the items listed as composing a building, a number of blank spaces are provided, both under the head of 'Masonry' and 'Carpentry,' for listing such items as the special character of a given contract might make necessary, or which the practice of a given neighborhood might require."

"Practical Estimator," and the "Handy Estimate Blanks," together with a line of practical publications on architectural, constructive, and mechanical subjects, for sale at the office of this journal, at publishers' prices. All orders from parts distant from San Francisco will be forwarded upon receipt of postal order, cheque, greenback or coin.

BOOK NOTICES.

Increased Line of Excellent, Useful, and Practical Works.

WE are rapidly increasing our stock of books, and intend to carry all publications treating upon Architectural, Mechanical, Sanitary, and similar arts and sciences, including those devoted to Stair-Building, Perspective Drawings, Cements, Painting, Plastering, etc. Will also furnish any book, journal, paper, or periodical published in

ANY COUNTRY OR LANGUAGE,

At publishers' prices, with cost of transportation added. All orders from distant places promptly filled.

REDUCED TO $2.50 EACH.

Palliser, Palliser & Co. Useful details. Specimen copy of

STEAM ENGINE CATECHISM, 1885,

By Robert Grimshaw, President James Watt's Association, received. A handy little work of 149 pages, on matters suggested by its title—engines, and steam in its ten thousand applications as a motive power. It will be found useful to young engineers, interesting to older heads, and convenient for examination boards.

It seems probable that the German engineers, using the record of others with the care and thoroughness characteristic of their race, have succeeded to an unusual degree in securing the benefits usually sought in the introduction of sewerage systems, but one is hardly prepared for such surprising results as those which M. Durand-Claye describes. According to him, the recent health statistics of the city show that in the portions not yet connected with the sewers there has been within a given time, we suppose a year, one case of typhoid fever to nine and three-tenths houses, and one death from the disease in every forty-third house; while in the sewered districts there was in the same time only one case of the fever to forty-nine and three-tenths houses, and one death from it to one hundred and thirty-seven and five-tenths houses. It must be remembered that Berlin is above all others a city of great apartment-houses, the average number of persons to a house being fifty-eight, so that these figures do not in either case show an extraordinary mortality from typhoid fever, but it is remarkable that the simple connection of the buildings with the sewers, without any change in the character of the drinking-water used in them should at once diminish by four-fifths the liability of their inhabitants to the disease. In fact, as the interior portions of the city, which are at once the most crowded and the least wholesome, have been the first to be provided with sewers, while the houses in the suburban circle, where the system is not yet complete, would naturally have fewer occupants, and those of a cleaner and better nourished class, it seems quite possible that a comparison of the numbers of individuals attacked, instead of that of houses, would show a still greater difference in healthfulness between the sewered and unsewered districts.—*American Architect and Building News.*

MASONS' AND BUILDERS' EXCHANGE
OF SAN FRANCISCO
Room 11, 314 Montgomery St.

BELOW will be found a list of the members composing this Exchange. Boxes are provided for each member, so that architects, owners, or others desiring the services of any particular member, or those having boxes who are not members, and yet whose business is directly connected with that of the Exchange, can readily secure the attendance of the party sought, by leaving a note in the respective boxes.

Building Report and Summary.

Our building intelligence report for the month, ending the 10th inst., shows a most encouraging and satisfactory condition of things in building circles. The number of contracts let during the thirty days since last report, is large—particularly considering the lateness of the season; for there are some who entertain the notion that it will not do to commence at the verge of the rainy period, although in fact it makes but little difference at what time in the year work is commenced in California. There may be some temporary disadvantage in the material "getting wet," but this is fully made up by the benefits to the lumber from the wetting. All building and finishing lumber used in California is improved by wetting. And if every foot of it before using was subjected to a water seasoning, it would benefit it greatly. But while some intend to "wait until after the rains," a sufficient number have commenced operations at once, to make the following showing:—

4	brick engagements, value	$100,200
112	frames "	411,339
40	alterations, additions, etc.	71,375
156		$582,914

This shows a falling off as compared with the preceding month, as follows:—

Sept.—Total engagements,	169,	value,	$746,100
Oct.— " "	156,	"	582,914
	13		$163,186

Notice.—*The name of this Journal having been used by parties not in any manner connected with this office, to obtain building intelligence and information intended for its columns, architects, contractors, and others will hereafter please assure themselves before furnishing same, that the party canvassing is properly authorized to represent us. Authorized canvassers will be supplied with sufficient evidence upon this point.*

We Will Donate in Cash $150

To any person, club, society, or association, that secures *two hundred* cash subscribers for this Journal.

House painting in Paris is a very extensive business, as a periodical renovation of the houses is rendered imperative by law, no one being allowed to disfigure a neighborhood by presenting stained and disfigured walls. The houses being of soft cream-colored sandstone, many of the finer structures, instead of being painted, are redressed by the stone-cutter and come out from the process looking bright and new.

ITS SEVENTH VOLUME,

Commencing with January, 1886.

Arrangements Looking to the General and Material

Enlargement and Improvement

OF THE

California Architect and Building News,

Are in active progress and preparation, and it is hoped, commencing with the January number next ensuing, that its numerous patrons will have good and sufficient cause to approve the result of our earnest and determined efforts

Returning *thanks* for past favors and encouragements but inadequately expresses the deeper sentiment of gratitude within, and no future effort will be wanting to express the sincerity of our appreciation of kindness and support received, and to render this Journal worthy of

CONTINUED AND GREATLY INCREASED PATRONAGE.

To enable the carrying to a successful issue of the purposes now being matured and perfected.

3,000 ADDITIONAL SUBSCRIBERS

Are wanted in San Francisco, and a corresponding increase throughout the

PACIFIC STATES AND ADJACENT TERRITORIES.

British Columbia, Australia, the Hawaiian Islands, and the States east of the Sierras, have liberally extended a helping hand, but we want a large increase in all directions, not simply from pecuniary considerations, but to enable the publication of a journal in San Francisco representing all Pacific Coast architectural, building, and mechanical interests, which shall possess intrinsic merit equal to any class journal published upon this continent.

Notice to Correspondents, Subscribers, and Patrons of this Journal.

Geo. H. Wolfe having no interest in, or connection with, this Journal,

All Parties in Business Relations, Correspondent, Financial, and Otherwise,
WILL PLEASE HEREAFTER ADDRESS
JAMES E. WOLFE,

Editor California Architect and Building News,
240 Montgomery St., S. F.

For convenience sake, use only—CALIFORNIA ARCHITECT, 240 Montgomery Street, S. F., as that alone will ensure prompt delivery.

American Newspaper Annual.—A very comprehensive book, covering the whole ground of its specialties, 996 pages; practical, useful, well arranged, and neat in its typographical appearance. Published by N. W. Ayer & Son, Philadelphia. May be ordered through this office or direct from the publishers, at $3.00 per copy.

A Destructive Fire.

THE conflagration occurring the early part of last week, which entirely destroyed the fine four-story edifice occupied by H. S. Crocker & Co., and owned by Chas. Crocker, the railroad magnate, was one of the most destructive in this city within a decade. The building, which was one of the handsomest business buildings in San Francisco, was completely gutted. All the floors above the cellar, and all girders, posts, and supports were consumed, or fell to the cellar, leaving nothing but the walls standing. The excellent construction of the edifice is sustained by the fact that, although the heat was fearful, and all the floors giving way and tumbling, the front wall, perforated by numerous door and window apertures, remained standing, and apparently but slightly affected by the raging flames. There was nothing saved. All within—a magnificent stock of stationery, and the largest on the Pacific Coast—together with an immense lithographic department, and all its machinery and appliances, and the manufacturing department of the largest jewelry house on the coast, were all consumed. And to all this is to be added the horrid fact that two daring firemen were caught by the *debris* falling from above, and were roasted to death in sight of their comrades, who could render no assistance.

The Building Boom Unbroken.

THE continuance of building activities has been to many, and continues to be a matter of surprise. Months ago the feeling gained ground, and was very generally entertained, that there must be a let-up—a cessation in building operations. But the decline has not as yet manifested itself, and there are no present appearances of a falling off in the near future. Architects' offices generally are "full of work," and as far as the future can be judged from the stand-point of the present, there will be a large building trade during the remaining months of 1885, with considerable work in course of preparation for commencing "after the rains."

This flood of building prosperity has not settled in any particular locality or section, but has spread itself over the entire city; for "go where you will," piles of building materials meet the sight, and the sound of busy mechanic's tools greet the ear. And yet withal, rental rates are well maintained, and the number of empty houses seems not to increase, although each month the average of new places of abode—single tenements, flats, etc.,—amount to not less than one hundred and fifty, and perhaps nearer two hundred.

San Francisco Chapter of Architects.

THE regular monthly and annual meeting of the Chapter was held October 2, with a good attendance of members. Mr. Macy acted as president *pro tem.*

The minutes of the previous meeting were read and approved. The Committee on Apprentice Indentures reported; the report was accepted and the committee discharged. The Committee on Incorporation reported progress.

Seth Babson, treasurer elect for the ensuing year, tendered his resignation as such, owing to residency "across the bay," and inability to attend the meetings regularly. Received and filed.

The annual reports of the retiring president, A. Laver; secretary, B. E. Henrickson, and treasurer, J. M. Curtis, were received, and ordered spread upon the minutes.

The newly-elected president, William Curlett, read an interesting paper, which was ordered spread upon the minutes, and to be published in the CALIFORNIA ARCHITECT AND BUILDING NEWS. It will be found in full in this issue.

A discussion arose in reference to the plumbing law, which resulted in the appointment of a committee, consisting of Messrs. Macy, Henrickson and Curtis to consider the subject and report at next meeting.

Messrs. Macy, Pissis & Curtis were nominated to fill the office of treasurer, made vacant by the resignation of the treasurer elect, Babson.

A resolution was adopted that the president, at each meeting of the Chapter, appoint a member to lead in the discussion of some subject of interest to the profession. In harmony with the resolution, the president appointed James E. Wolfe to open the series of discussions, at the November meeting, which will be held the first Friday in November next.

No further business requiring attention, the Chapter adjourned.

An Ancient Sanitary Ordinance.

THE burgh records of Glasgow, Scotland, for the year 1574, show a complete and excellent set of regulations "for awaye haldyng and preservation of this gud toun" from the pest or plague. In these regulations occurred the following item concerning the reporting of cases of sickness to the proper officers, termed "searchers:"—

"It is statute and ordanit, that gif ony persone or persones indwellaris in this toun, happins fra this tyme furth to fall sick, that the maister of the hous incontinent cum to the visitors and sercharis of the gait, or any of thame, and shew the samyn, that thai may be sichtit; and gif ony persones happinis to deceis in ony house within this toun, that the maister of the hous sall cum to the visitouris adpoyntit for sichting thairof or thai be wyndit under the pane of banishment."

Another provision in the regulations read to this effect:—

"Ordanis the schule-hous wynd and all the wennallis to be simpliciter condampnit and stekit up."

Address of Mr. Wm. Curlett, before S. F. Chapter of Architects, Oct. 2, 1885.

GENTLEMEN: Permit me to thank you for the honor you have conferred upon me by electing me President of this association, and if, as I hope, I shall succeed in filling its responsible duties to your satisfaction and the advancement of our professional interests, but more particularly the advancement of the younger members of the Institute, I shall attribute it to your cordial support, which I feel assured will at all times be afforded me, so that, by your co-operation, every meeting may serve to bind us more closely together, for we know that without union in all matters it is useless to hope for success.

I cannot conceal from myself, however, that there are many Fellows whose claims to this honor are far in excess of my own, when I reflect that many of our members are eminent architects, and have practiced in this city for more than a quarter of a century, and that many of those older practitioners have been active members and colleagues together in the pioneer association, which, unfortunately, existed but for a limited period—however, it must be gratifying to those members, even at this late date, to view the result of their laudable efforts to form and maintain an Architectural Association on this coast, for the present association is but an offspring of the former, which, I feel sure, is now beyond the possibility of failure.

In reviewing the progress that has been made by the present association since its affiliation with the American Institute, I congratulate the Chapter on the substantial advancement made during that time, in the acquisition of members as well as the general improvement and development of the possibilities of our art.

I also congratulate you individually on the earnest and studious manner with which you have at all times sought to cultivate professional relationship and further the promotion of mutual intercourse and the advancement of professional knowledge, which is essentially necessary to the advancement and development of the principles of architecture; for we must remember that knowledge is accumulative, and that we all know more now than we did even one year ago; that each one of us has some new idea to impart—moving, as we are, onward in the pursuit of our calling—for every year education makes strides, and we can only maintain our position in the world by showing that we are worthy to do so. To neglect all efforts at culture and the scientific side of our work is simply suicidal.

It should therefore be the desire of every member to make this institute attain its object and realize its noble ideal. To this end he should at all times endeavor to lend the full force of his ability and influence, so far as his time will permit.

I will venture to say that I am but expressing the sentiments of the individual members of not only this, but any Chapter or association

of architects throughout the length and breadth of this country, that their monthly meetings should be something more than merely assembling for the purpose of reading the minutes of the previous meeting and transacting the usual, or routine business, such as hearing reports and appointing committees.

Now, then, I will suggest that our meetings be turned to some account, and that our time be spent so that it may redound with not only credit to ourselves, but of interest to the public. To properly accomplish this end, I should recommend that we improvise some system whereby at each meeting we elect one of our number to prepare a paper on some subject of his own choice, to be read at the following meeting. Would it be too much to ask of each of our Fellows, or associates, as they join our ranks, the contribution of an essay, or paper, on some subject connected with architecture or its practice, of which he has made a particular study?

The arguments and debates naturally arising from the reading of such papers cannot fail to be of lasting benefit to us, as I can assure you that for whatever time we devote to the study of the most simple, as well as the most complex subject, we will each in return obtain some new and interesting information that otherwise would have been passed unnoticed. Suppose we begin at the bottom, and take up the subject of foundations. What a field for discussion this first and most important part of our building construction affords us, and particularly in a city like this, where so many of our heavy and expensive structures have been erected on the most dangerous and deceptive mud banks, which, I regret to say, in some cases have already shown conspicuous signs of miscalculations? This, I claim, is something that requires our most careful attention; otherwise, but a short time will elapse before the engineer will add this portion of our vocation to his already large practice, for, indeed, he has already encroached on a class of building, such as railroad depots and manufacturing warehouses, all of which formerly came under the province of the architect, and which, undoubtedly, was a most lucrative part of his profession. Such men are generally called civil engineers, but whether this is a civil act towards us I will leave you, gentlemen, to be the judges.

Then, for instance, the topic which is agitating the minds of the public at present, the importance of which has been so ably set forth by the *Chronicle*, that of drainage and house sanitation, what an endless subject for study! One of the first inquiries of almost every one now who takes a house, or contemplates building, is about the plumbing and drainage. Considering that the health of a family depends largely on the perfection of this branch of our work, the importance of this subject cannot be disputed; and unless an architect can advise and carry out sanitary work in the most scientific manner, his reputation must assuredly suffer. Should an architect neglect this branch of his profession, we may look for an increasing number of specialists; for have not the interior decorator and manufacturer appropriated another slice of our commissions? What we must convince the public of is that we are, as a body, necessary to their health and comfort, and that they lose in the long run by going to outsiders, whose only recommendation is that they do the work cheaper. This I consider entirely wrong, for the architect should not only design the house, its interior fittings and furniture, but he should also supervise and direct all interior decorations. If he is not the person most competent for this work, he should, before he is entitled to be recognized as an architect, or to be intrusted with such matters, be thoroughly conversant with all styles, so that he may give to his client sound and valuable advice.

It is true that a greater change and general improvement in interior decorations have taken place in this city during the past five years than have occurred since the discovery of gold.

We cannot disguise the fact that the architect of to-day must make his work apparent. He should, therefore, not be satisfied merely to act as a draughtsman, simply designing the skeleton of our dwellings for the decorator and manufacturers to step in and complete, but he must also prove to his client that he has both the intellect and culture to carry out any work that may be intrusted to his care, whether it requires a good knowledge of construction or a well-trained artistic taste.

It would seem, however, that the mission of the modern architect reminds a person of what is happening in the bee world just now, where, by the aid of an ingenious patent, ready-made cells are stamped out in wax of the correct shape and size, and when placed in the patent hive, the bee forthwith completes the cells and fills them in with honey. And I regret to say that it is seldom that the American people have to thank the architect for the poetry of their homes. However, it must be admitted that the profession is a learned one, for we all have read with deep interest of the attainments and achievements of the eminent architects both of the Old and New World; for what we know of Wren, Inigo Jones, and the Chambers, the architect was conversant with every branch of the work included in the structure.

It has often occurred to me that one of the most pleasant provinces of an architect should be to turn the necessary articles of daily use into works of art. And it must be conceded that year after year there is a growing tendency to make simplicity in design the guide towards beauty, as well as towards convenience and stability, instead of an adherence to some conventional type of design and decoration, or a straining effort after originality.

Speaking of originality in design, suggests to me that we have in this city a great amount of the so-called work, which I do not think reflects very highly on its authors. I think the more perfect the young architect's educational training has been, the more conservative he will be in his work, and is thus less liable to foist on the public this hodge-podge of incongruities, which their authors and their innocent clients are pleased to consider as architecturally correct. However, we have a right to be hopeful for the future, as I think we have passed a period in this city of what was termed "California style," which produced so many mere houses, for we are fast growing away from the thralldom of the aggressive and persistent stereotyped front, covered with meretricious ornamentation. Does it not seem a useless waste of skill and labor to put so much detail and elaboration on a piece of carved work which is often placed so far from the naked eye as to baffle all attempts to fathom its character or design. I believe all architectural features in which carving is introduced, ought to be looked at and drawn in the exact place for which they are intended. A great advantage will be gained by the young architect who will devote some of his time to learning to model, for I believe all carving, whether for the interior or exterior of our public or private buildings, should first be modeled, if not by the architect himself, under his immediate direction. By this system we may hope to obtain some harmony throughout the work, which is essential to good effect.

To the younger members of the Institute, who naturally will, sooner or later, take the place of their older brethren, and who I cannot doubt will be no unworthy successors, I recommend that a close intercourse be cultivated throughout the Chapter; for you will find that an addition of minds well trained in the profession, broadens its influence on the public taste, and enlarges its sphere of knowledge. You will also find that the building community is imbued with clearer conceptions of the science on what our art depends for its stability, than in the early mining days. The more time you devote to study, the more you will find that it is a profession that to attain success in, taxes the best efforts that you can put forward. It is true that industry alone will not make a great artist, architect, or sculptor. But we all know that if there is one thing more certain than another in art, it is that all great men have been industrious. You will find that the pursuit of references must needs open up studies which will be of lasting benefit to you, little dreamed of at the time, and which will prevent your being drawn into the downward current which sets strongly in the direction of business as against art, for we must admit that the commercial spirit of the country has too little sympathy with the artist.

One thing more I would have you remember, and that is, to ascend the ladder of fame you must be persistent in work, so that when the golden opportunity presents itself you may be well prepared to move onward and upward. Remember that in all professions thousands are blockading the bottom, or first round of the ladder, while but few make the ascent to that position where competition is seldom known. Although our members are steadily

on the increase, there are yet a few highly qualified men in this city whom we would gladly welcome into our midst as members of this Chapter.

Before closing this short address, I should remind you that the parent Chapter holds its annual meeting on the twenty-first and twenty-second of this month in Nashville, Tenn., and in conformance with the established rules, a report of our past year's transactions is to be transmitted to that body. And I would now offer a suggestion, that we should be represented each year by one at least of our number, with a view of persuading the Chapter to hold its annual Convention in this city at some early date.

I think it is in order here to say that we are largely indebted to the reporters for their attention at our meetings, and their readiness to impart to the public our deliberations. We are also particularly indebted to the editor and proprietor of the CALIFORNIA ARCHITECT AND BUILDING NEWS for the large space he has set aside for the record of our meetings. And now, in conclusion, with heartfelt desire for the advancement and further development of the Pacific Coast Chapter of Architects, I again thank you. WILLIAM CURLETT.

California's Tribute to the Honored Dead.

IT is a well-assured fact that the people of California will erect a monument to the memory of the immortal Grant, and that it will be one worthy of the Golden State. The movements thus far developed place the matter beyond reasonable doubt as to its finality. The recent meeting, presided over by the Hon. Senator Stanford, will create wide-spread confidence and give tone and character to the movement, and there is every good reason to believe that the gentlemen whose names are prominently connected with the several committees will so shape future operations, and guard the various avenues surrounding and leading to the grand consummation, that nothing will occur in judgment or action that will not be above all suspicion of personal interest, prejudice, favoritism, or ulterior motives not of the purest and most worthy character, and universally acceptable and satisfactory.

THE DESIGN.

The most difficult part of the whole work will be the obtainment and selection of a suitable design, one that will meet the highest expectation of the greater number, and be worthy of the approximately perfect type of manhood, whose memory it is designed to perpetuate. There are greater possibilities of error in this connection than in any other, and it will require of those with whom the responsibility may rest, the exercise of

GOOD JUDGMENT, PRACTICAL KNOWLEDGE, AND FIRM AND HONEST PURPOSES AND DETERMINATIONS

To avoid serious mistakes as to the design. Every one who conceives and produces a design will naturally hold that his own is the better, and universal experience proves that men more skilled in manipulating, working, things, than in the art and science of designing, have succeeded over true merit.

We shall again refer to this matter. At present, appearances are all favorable to earnest and vigorous action.

Cost of Buildings East of San Francisco.

VERY many of the exchanges received at this office monthly, contain plan and designs for buildings—more generally those of medium and the lesser grade classes, suitable for persons of moderate means and wage-earners—in connection with which the cost of construction is also stated.

It *may be* possible in some parts of the grand universe of God, bounded by the domains of the United States, to do as much for the money as is sometimes stated, but we know not where—all labor and materials being paid for.

One thing is most certain and sure, no plan yet published in plan book or periodical can be built in California for the sum affixed as the cost value of construction, not by 25 to 100 per cent added. As a rule, gross deception prevails in this connection, and we risk the assertion that there never has been anywhere a strict conformity to the plans published, within the limits of cost stated by the author This is a pretty broad assertion to make, but it is based upon the experiences of nearly fifty years in almost constant contact with building matters, and upon the ground that all the materials used cost a right and reasonable commerical market value, special and extraordinary advantages excepted.

The effect of this is bad, in that it leads owners to expect more than can be realized, and when told by an honest and intelligent architect that their visions of cheapness cannot be attained, disappointment follows, and hardships created for architects, as they must necessarily explain and show causes and facts, why the thing cannot be done, which, however reasonable and true in themselves, are not always convincing and clear to the party whose mind may have been influenced and pre-disposed to an impossible conclusion.

It is very well known and understood that the price of both material and labor varies in different sections of the country, and the same *exact results* would scarcely be possible in any two localities; consequently figures of cost representing and fitting one, would apply to no other section, beyond the same conditions and surroundings Yet plans are sent in all directions, with the same figures of cost for all without discrimination or modification. But the broader proposition stated is that the prices as a rule are placed too low—less than can be reached anywhere, and very much below the cost of construction on the Pacific Coast.

Dwellings for Village and Country Homes $3 00
Furgason's History of Architecture. Two volumes 15 00

The Mechanics' Fair—1885—Ended.

THE twentieth exposition under the auspices of the Mechanics' Institute, ended a most successful career of thirty odd days, on the 26th of September. It was a pleasant place of resort, and tens of thousands of visitors of all ages availed themselves of the opportunity of enjoying sights and scenes which can be found clustered only at exhibitions of this character.

Some of the preceding annual displays may have been more crowded with exhibits, particularly in heavy and noisy machinery; but it is questionable whether any have been more enjoyable or instructive to the multitudes who have, through its opportunities, sought information and pleasure from real life in the varied forms presented. Persons uninterested in any particular thing, whose faculties of appreciation are normal and obtuse, might spend a day or evening "at the fair" or anywhere else without profit or improvement. But the eye and mind awake and alive to see and learn from the evolutions and developments of the age, as demonstrated in the innumerable shapes and forms to be seen during the fair, could not be otherwise than benefited and instructed.

The moral aspect of the fair was excellent. While the streams of life and smiling faces flowed full, and cheerful and happy greetings abounded, there were no events of rudeness or indecorous conduct transcending the bounds of the strictest proprieties, and many were the regrets expressed upon the closing evening that the managers had not extended the time at least two weeks longer.

The fruit, vine, wine, wool, silk, mineral, and other great resources of the State were well represented, as were also the industrial, mechanical, commercial, and other arts and sciences. It would be impossible for us to mention in detail each particular object or thing of interest. Some of the exhibits, as a matter of course, attracted more general attention, and at all times crowds were gathered around them. Of this class, the exhibit of

NATIVE CALIFORNIA AND OTHER HARD AND FANCY WOODS,

By Thomas Hatch, covering a very large space, and including a great variety of tree growth, and some extremely singularly marked specimens, representing in native laurel, black walnut, and redwood, perfect representations of the faces and forms of men, bears, fish, birds, and other animal life. There were also splendid specimens of California maple, sycamore, oak, etc., as well as representative woods from Mexico and the islands of the Pacific. This display secured a *gold medal.*

THE DISPLAY OF STAINED, GROUND, AND BENT GLASS,

By John Mallon, was complimented by the presentation of a gold medal, and also for cut and embossed glass, a silver medal. As usual with displays by Mr. Mallon, it was good.

THE S. F. EMBOSSED GLASS WORKS,

W. H. Warren, proprietor, 997 Market Street, made a liberal and handsome display of colored, ornamental, and enriched sheet glass, varying in suitableness and beauty from the gorgeous cathedral and church window, down through the various lesser designs, to the street-car lights. The display attracted much attention, and was awarded a bronze medal.

CALIFORNIA ONYX,

Mantel, and pedestals, etc., exhibited by J. and F Kesseler, silver medal. This display was very attractive, the material being unequaled by any other variety of the marble species for beauty of color and tint.

WEED & KINGWELL

Made a fine display of brass goods and devices of their own manufacture, and were awarded a gold medal for best assortment of brass works, and silver medals for best assortment of bells, and best display of plumbers' goods.

WILL FINCK

Received grand silver medal for best display of cutlery. This firm manufactures not only handsome, but excellently good articles.

HARVEY'S HOT WATER RADIATORS

Were among the notable exhibits, and enlisted the interest of thousands during the fair. This being the age of evolutions, the Doctor has improved the time within the past twelve months, and evolved several new devices as attachments to his original system of heating, and now claims to have the most perfect and practical hot water heater in use, for heating both public and private buildings. A silver medal was awarded. Place of business, 23 Stevenson Street.

PATENT CHIMNEYS.

Mr. Browell made a good, practical display of this desirable and almost indispensable adjunct in house building, by means of which fires can be enjoyed in every room in a building, with perfect immunity from the dangers of conflagration. Mr. Browell has spent many years of his life upon this device, and in renewed approval the Committee on Awards presented Mr. B. a silver medal.

BURR FOLDING BED CO.,

603 Market Street, under the Grand Hotel, exhibited a variety of styles of sideboards, bureaus, library cases, desks, etc., which, by a motion or two, and in less time than is required to write one line of this notice, can be transformed into full-fledged spring beds, and as speedily folded back again into desks, sideboards, etc., leaving no trace of the sleeper's couch. They are ingenious, and supply a handy bed and bedstead convenience in the parlor or dining-room, if you please, disguised under the perfect appearance of any desired piece of furniture. Bronze medal.

PACIFIC ROLLING MILLS

Received a gold medal for best display of steel castings, forgings, etc. There are great possibilities in the future for this pioneer establishment in its line, and it is to be hoped that its management will not only succeed in capturing gold and silver medals at every competitive exposition, but that they will also succeed in meeting every want on this coast, in things within the range of their manufacture, so as to render it possible for wrought iron workers in San Francisco always to compete successfully with Eastern firms.

HAWLEY BROS. HARDWARE CO.

Were active competitors, and carried off several silver and bronze medals, for best general display of agricultural implements, cultivators, corn shellers, tree diggers, etc., etc.

OSBORN & ALEXANDER,

Bronze medal for best display of bicycles and tricycles. This firm of hardware dealers are energetic, and permit no opportunity to pass unimproved, in variety and kinds of goods and merchandise best calculated to suit the wants of the general public.

THE BOLLER FURNITURE CO.,

Which but recently sustained a very heavy loss by the destructive conflagration on Fourth Street, received a silver medal for best bed-room furniture. Included in their line of manufacture are wood mantels, of which they have many very fine designs, and the class of workmanship is good.

HUETER BROS. & CO.,

Silver medal for best display of varnishes, gums, etc. It is always pleasing to notice California manufactures and productions succeeding in fair contests over imported competitors.

E. G. DENNISTON,

Silver medal, best display of plated wares and works. As the result of close and diligent attention to business, not only in *making trade*, but in *producing good work*, Mr. D has accomplished a decided business success, and with life prolonged there is a large future before him.

J. T. TITUS

Received silver medal for the best flushing and sewer trap. This device has passed through many trying tests, and has proven itself a success in all cases.

THE GRANOLITHIC PAVING CO.

Had on exhibition samples of the stone manufactured by them, in the form of heavy steps, urns, etc., beside which were specimen pieces of the window sills, ashlers, and other facings and parts intended for use in the Donohoe building. For many purposes this manufactured stone has taken the place of the natural, and in time is likely to be appointed to every service requiring strength and durability. Demonstrations are at present being made, in which concrete, the components of "patent stone," is taking the place of wrought iron beams. A silver medal was awarded to this company.

COTTON HOSE,

"Rubber-lined—always reliable, and the strongest and most durable made," was exhibited by W. T. Y. Schenck, 36 California Street, and the gentlemen appointed to determine relative merits, so far gave precedent to the exhibits of Mr. Schenck, as to award a diploma.

THOS. DAY & CO.

Displayed a fine line of gas fixtures, etc.

CALIFORNIA WIRE WORKS.

As usual, an extensive exhibit of wire works, in almost every form, and for endless purposes; gold medal.

P. & B. PAINT,

Exhibits extensive and varied. The management is indefatigable in pressing the merits of the paint material upon the attention of those requiring paint of its kind, and so far favorably impressed the Award Committee as to receive a silver medal.

MR. DAVID KERR

Received deserved recognition for his exhibit of a splendidly built, practical truck, which seems ponderous and powerful enough to transport the whole exhibits of the fair in half a dozen loads, yet so neat and perfect, that with a good team of horses, and some cushioned seats, the entire Board of Managers of the fair, with David thrown in, might take a pleasant ride through Golden Gate Park and on to the "cliff" with comfort. This splendid piece of mechanism received a gold medal. To same manufacturer was awarded a silver medal for best four-spring two-seated wagon, and also truck axle, California make.

THE ONLY SPECIALTY IN THE ELEVATOR LINE

Was the *personals* representing the elevator interests. Mr. John Hammond, agent for the Otis Bro. elevator, representing the New York firm. Mr. Wm. Milliken, the genius of the Ram elevator; Mr. Hinckle, of the Hinckle device; Mr. Wm. C. Burch, Mr. Jardine, Mr. B. E. Henriksen, and other elevator builders and clutchmen, being nightly found among the lively throng of visitors.

BAKER & HAMILTON

Also received gold medals for display of agricultural implements.

John Bergstrom & Co., gold medal, best pipe organ, California make.

S. & G. Gump, gold medal, picture frames, pedestals, mantels, etc.

We have been able to notice but few of the successful exhibitors, as to do so in full would occupy nearly one half the pages of this issue. The management certainly deserves great credit for the completeness of arrangements, and the general good taste and judgment displayed throughout.

Should there be any error in the foregoing report, we will gladly correct the same in the succeeding issue.

The days of machinery, remarks a contemporary, have been for the poor man days of home-making and home-making comforts, as no other days ever were. If machinery has given the rich man luxuries, it has given the poor man the necessaries and comforts of habitation, and clothing, and travel, such as he never had before. The printing press, especially, is the poor man's servant and benefactor, scattering abroad our intellectual wealth, raising all to an intellectual level, and binding all into one whole.

Staining of Woods for Decorative Purposes.

A. CURTIS BOND.

THE art of laying various ground shades of color on wood, with or without veins and figures, or vein patterns, and known as staining, adds very materially to the resources of decoration, as enabling white and other soft woods easily worked to present the appearance of rich and costly woods, or the exquisite tints of woods not growing in a sufficient quantity or of a size to be utilized in cabinet or architectural wood-work, especially in the way of veneering.

Staining also admits of altering at any time the wood-work of an apartment so as to bring it into accord, or cause it better to contrast with wall-paper and various mural adornments, or with furniture. One description of staining is applied to merely heightening the color of choice woods. The stains are ordinarily put on with a hog's bristle brush, followed by a badger hair softener, but flannels and sponges are often used in their place. For veining or ingraining, badger sash tools and sable pencils come into play.

Where woods of different hue of the same kind are brought together, as in restoring antique furniture, graining is resorted to in order to match the newly inserted pieces with the ancient. Thus to match light with dark-hued mahogany, the former is washed with soap lees or with quicklime dissolved in water. Aqueous decoctions of logwood, dyed oil, aquafortis, sulphate of iron, nitrate of silver, bichromate of potash, and other preparations of an acidulous and alkaline nature are classified in this connection as "darkeners."

Pleasing, yellow hues are supplied by aqueous decoctions of barberry root; rich, mild reds, by only decoctions of alkanet root, and alcoholic solutions of dragon's blood; a reddening tincture, by rectified naptha, in which cam-wood dust has been steeped. The color of birch is heightened by sponging it with oil, slightly tinted with rose madder or Venetian red. Discolored ebony is revived by a strong decoction of gall nuts. Inferior rosewood will apparently be advanced in grade by applying the liquid obtained from boiling a pound of oak bark and the same quantity of walnut shells and peels. Honduras mahogany loses its pallid and dull hue by being first coated with spirits of hartshorn, and then with red oil. Raw oil and turpentine have the effect of increasing the attractiveness by adding to the beauty of many woods. American ash is made to resemble oak by drawing veins on it with a white stain, coating these with thin varnish, and darkening the remaining ground; or the veins are scratched fancifully after the varnish is laid on with a rag saturated in the ordinary preparation of French polish. A decoction of Brazil woods supplies the rich hue of rosewood, and the veins may be made by a camel's hair brush dipped in a liquid prepared by boiling logwood chips, sulphate of iron, and steel filings in equally proportioned quantities of vinegar and water. Three distinct coats of this preparation will give white wood the appearance of ebony. Showy elmwood may be delicately darkened so as to pass for Italian walnut. In short, the modifications are as various as the tints obtainable from simple and compound colors, the result being influenced by chemical and mechanical skill brought to bear on woods of different quality.

For a fine crimson, boil one pound of good Brazil dust in three quarts of water for an hour; strain and add half an ounce of cochineal, boil gently for half an hour. If more of a scarlet tint is desired, boil half an ounce of saffron in a quart of water for half an hour, and pass over the work previous to the red stain.

For purple, boil a pound of good chip logwood in three quarts of water for an hour; then add four ounces of pearlash and two ounces of indigo pounded.

For fine blue, add four ounces of indigo to a pound of sulphuric acid.

For a fine green, put four ounces of the best verdigris pounded fine, half an ounce of sap green, and half an ounce of indigo in three pints of the strongest distilled vinegar.

Note that for a bright yellow, the wood need not be stained, as a small piece of aloes put into the varnish will have all the desired effect.

For red, archil will produce a good stain, when used cold, but it is improved in color, if after one or two coats have been applied and suffered to get almost dry, it is brushed over with a hot solution of pearlash in water.

To improve the color of any stain, apply a mixture composed of one ounce of nitric acid, half a tea-spoonful of muriatic acid, a quarter of an ounce of grain tin, and two ounces of rain-water, kept in a well-corked bottle two days before using.

A black stain may thus be made: Boil one-half pound of chip logwood in two quarts of water; add one ounce of pearlash, and apply hot with a brush. Then boil one-half pound of logwood in two quarts of water as before, and add one-half ounce of verdigris and one-half ounce of copperas; strain off and put in one-half pound of rusty filings; with this go over your work again.

The Queen of Roumania is said to be an architect as well as a painter, musician, and poet. A new palace has been erected in the mountains, for which the designs were prepared by the king and queen. Her Majesty's music room is suggestive of a church. The windows are filled with glass, on which scenes from the works of the Roumanian poet Alexandri are painted; the seats are like stalls in a choir, and to aid in the illusion, strict silence has to be observed by all who have the privilege of being present at the performances.

All New Subscribers

PAYING or forwarding $2.00, will be entitled to the present and all succeeding numbers for 1885, and the whole of 1886.

A small item, page 156 in the September number of this Journal, has called forth the following letter, which is self-speaking:—

BALTIMORE, Sept. 24, 1885.

Dear Sir:—Allow me to call your attention to a slight mistake in your September number of the CALIFORNIA ARCHITECT, in which you mention a new "electric railway on Huntington Avenue, Boston." It is Baltimore, not Boston, that deserves the credit. The Union Street railway here has been experimenting with the Daft electric motors for their suburban road, out Huntington Avenue to several towns in the suburbs, for the past year, and have had the inventor here for weeks at a time trying different ways, and about two months ago finally succeeded in gettting everything complete. They now have five motors running trains back and forth over the road, which is about six miles long. The trains go at the average speed of thirty miles per hour, including stops, and the ascents of the grades, several of which are six hundred feet to the mile. Both the cars and the avenue are lit by electric lights.

Owing to the great danger of the center electric rail, it has been boarded up, leaving a narrow groove in which the wheel runs. Before this was done there were a great many accidents to persons and horses stepping on the rail at the crossings and receiving a charge of electricity. Although it works very satisfactorily where it is, there is no telling how it would answer in the crowded city streets, and there is small probability of its being used inside of the city limits for some time to come.

I hope you will make the inclosed correction for the *honor of old Baltimore*.

Respectfully, W. CLAUDE FREDERIC,
Architect.

Shoe Lumber.

A CORRESPONDENT of the Chicago *Times* says that one may see, in passing the shops of Tokio, cords of sandal-wood cut into small blocks. This, one learns, is nothing short of shoe timber. These cords of wood will speedily be converted into shoes of various sizes, at prices ranging all the way from four to twenty cents. One feels quite exalted in a pair of twenty cent shoes. The wood is called Kiri, and is very light. The clogs are still further lightened by hollowing out the center. So, in point of fact, there is little truth in calling the shoes heavy, although they appear so to the inexperienced observer. It must be admitted, though, that they are unreasonably clumsy. Sometimes the shoes worn by the ladies are laquered, and are fastened by a velvet band passing from either side over the lower part of the instep, and between the first and second toes. With this same kind of wood are made bureaus, provided with strong iron handles, and the whole box is adjustable in horizontal sections, one piled above another. Owing to lightness of the wood these boxes may be filled with clothing and carried off on the shoulders of the coolie in case of fires, which so often vex the people of Tokio.—*The Furniture Worker.*

"Hades and sheol" may all be well enough for ordinary occasions, but when a man is putting up stove pipes nothing takes the place of the good old unrevised version.

Architects as Sanitarians.

OUR enterprising contemporary, the *Inland Architect*, has started a crusade, of a very heroic character, against sanitary architecture, plumbing, engineering, and, withal, sanitary literature. It professes to regard the application of sanitary science to practical house-building as a species of modern craze. It denies every important advantage which has, supposably, been derived from the practice of hygienic principles in construction. It urges a return to the insanitary simplicity of an earlier day with its open sewers, untrapped drains, and unventilated soil-pipes.

It is matter for congratulation that this old-fashioned journal is powerless to turn back the hands very far upon the dial of progress, but it is to be regretted that it should seek to use any measure of its influence in so mischievous a cause. In support of its position it adduces, however, several noticeable arguments.

The intricacy and cost of sanitary apparatus; the impossibility of its being obtained by the average householder; the inability of the ordinarily educated architect or plumber to comprehend sanitary details; and the failure of the whole system to lessen the prevalence of zymotic disease—these are the principle pleas which it sets forth. We say that these are noticeable points, not because they are, by any means, answerable, but because they are suggestive of certain obstacles which sanitary scientists have to meet. Simplicity of apparatus is a desideratum, but it is one which it is not impossible, at the present time, to obtain. There is an undue tendency toward excessive elaboration, in some directions, but it is anything but an essential feature of sanitary work. It requires nothing but competent selection to secure simple and manageable apparatus at a moderate cost. Perfect appliances must necessarily cost more than imperfect ones, but the advantages they involve are an actual compensation for the additional outlay.

As to the architects and plumbers, it is a libel to pronounce them incompetent sanitarians as a class. Undoubtedly there are many in both guilds whose education, obtained from the pre-sanitary school, is defective, but progress in any direction would be impossible were the age to wait for the declining generation to be educated up to its advance steps. Men there are, of every time, who are sufficiently progressive to keep abreast of current improvements, but there must always be laggards in the race. It is the business of the architect and the plumber of the present day to be sanitarians, and they are rapidly becoming such. The sanitary engineer may have a future before him in his own separate line, but, at present, he simply fills in the gap between the new school of architects and the old.

Respecting the failure of sanitary science, as applied to the dwelling, to reduce the frequency of zymotic diseases, we can only say that our esteemed contemporary is evidently unfamiliar with the statistics of the very recent insanitary yesterday and the more enlightened sanitary to-day. Year by year, these diseases are yielding to improved household conditions. More and more distinctly are they traceable to the lack of sanitary conveniences. The annual death rate, from these causes, is steadily decreasing. And because certain robust individuals withstand the influence of unhygienic surroundings, and still live on, are we to credit sewer-gas and its accompaniments with a protective power?

The sanitary movement may be, at times, ill-directed, but it has attained an impetus which will carry it successfully forward, and we would kindly caution our journalistic neighbor that "it is hard to kick against the pricks."—*Northwestern Architect and Improvement Record.*

PLATE I.—FRONT ELEVATION OF ONE-STORY AND BASEMENT COTTAGE.

TO REMOVE DRY ROT.—A Russian professor has been experimenting, says the *Architect* on the best way to remove dry rot. He says that a thorough draught will destroy the parasite within twenty-four hours. If the action of draught be assisted by that of sunlight, a few hours will often suffice to put a stop to further damage. A concentrated solution of common salt is very efficacious, and the stronger it is used the more rapid its action. The action of a concentrated solution of cuprie sulphate (blue stone, blue vitriol) is still more energetic and complete than that of common salt. Crude carbolic acid is rapid in its action and cheap, but inconvenient to use. But he considers that the best, cheapest, and most convenient material to employ is the tar obtained when birchwood is distilled for acetic acid; the under surfaces of the flooring are painted with the tar.

Early Plastering and Plasterers.

THE use of plaster, or "plaister," as it was formerly called, is of early date, even in the British Islands, in connection with domestic architecture. Long before lime plaster came into general use, a tenacious clay or sticky and unctuous earth was employed when procurable, and, in its absence, whatever clay, or mixture of mud and earth, produced the most binding material. The rudest and coarsest forms of daubing or plastering in the British Isles were those structures erected of wattles and daubed over with clay to keep out the cold. These kind of domestic buildings were common in Ireland in the time of Henry II. From necessity or in conformity to the fashion of that country, the English monarch erected, according to Roger Hovenden, a royal palace with "uncommon elegance" of smoothed wattles in 1172, and in such buildings his majesty, with the kings and princes of Ireland, solemnized the festival of Christmas. The Devonshire "cob," a class of building not yet extinct, is a fair illustration of the ancient fashion of daubing or plastering practiced in this country for long centuries. In the thirteenth and fourteenth centuries in this country the plasterers proper and the daubers formed two distinct classes of building workmen, and their wages, like the wages of other operatives, were subject to certain regulations summer and winter. The daubers were simply the layers-on of a mixture of straw and mud to a framework of timber. The plasterers in London in the 24 Edward III. (1350), were bound to take no more for their working-day between the feast of Easter and St. Michael than 6d., without victuals or drink, and for the remainder of the year 5d. Upon feast days, when they did not work, they took nothing. The masons and carpenters received similar pay. As a curious contrast with rights claimed by building workmen in the present day, those of the fourteenth century were allowed nothing for making or mending their tools. We know what fierce disputes took place within the last quarter of a century on the question of "grinding money," and how it was at last acceded to by the employers that a workman about being paid off was allowed a certain time for grinding or sharpening his tools, with a view of being prepared for his next job. The dauber or inferior plasterer of the fourteenth century received only 5d. per day from Easter to St. Michael's Day, and 4d. for the rest of the year. The daubers had laborers to attend them as well as the tilers, and these laborers received only 3½d. for one part of the year and 3d. for the other.

At an earlier period in the preceding reign, in the 10 Edward II. (1317), we have an interesting agreement concerning the plastering of the hall of John de Bretagne, Earl of Richmond. From an earlier document the residence mentioned would appear to have been situated in the locality of Ivy Lane or Warwick Lane, near St. Paul's. Thus runs the agreement of the master-plasterer of the fourteenth century:—Know all men that I, Adam le Plasterer, citizen of London, am held bound to Sir John de Bretagne, Earl of Richmond, to find plaster of Paris, at my own proper charges, good and sufficient, without default, proper for the hall of the said earl, and also that I will competently, at my own proper charges, plaster and complete the said hall, and will repair the walls of the same with the said plaster, well and befittingly within and without, as also the tewels [the louvres or flues] to the summit, in such manner as befits the repair of the hall aforesaid; and this I will do for 24 pounds sterling, which my lord the said earl has paid to me beforehand. Faithfully to perform the which work within eight weeks from the day of the Holy Trinity next ensuing, I do bind myself and all my goods, movable and immovable, namely, my lands, houses, and tenements within the City of London being, to distress in part of any bailiff of our lord the king," etc. Plaster of Paris appears to have been used in England long before this period, but whether its use preceded the Norman migration, and how long, we cannot say. Native gypsum could supply a fair material in the absence of the imported article, and there are several beds of it in different parts of the kingdom. We have further mention of the plasterer or dauber and his wages in an account of moneys expended by a trustee on the repairs of a house in the parish of St. Michael Cornhill, in the 33 Edward III. (1359), viz.:—"For 12 cartloads of lom [loam], 4s.; for 9 sacks of lime, 18d.; for 3 cart oads of sand, 12d.; for one workman's wages for daubing, 9 days at 7d. per day, 5s. 3d.; for his man the same day at 5d. per day, 3s. 9d." Again, in an account of expenses incurred by the representatives of the city attending the Parliament in the 13 Richard II. (1389), the plasterers, or daubers, put in an appearance. "For timber and carpentry, tilers and daubers, in preparing the house for their lodgings, as well as the chambers as the hall, buttery, kitchen, and stables for horses; and for making stoles and fourmes, [stools and formes] throughout, and for carting out the rubbish, such house being quite ruinous; as also for payment made to the good man of the house for said lodging, £6 9s."

The antiquity of fresco-painting, even its older forms, shows that the services of the plasterer were in requisition at a very early date in Rome, Athens, Egypt, and other places. In the mediæval period fresco-painting, in connection with our ecclesiastical and other edifices, was pretty general over the three kingdoms. In the fifteenth century the windows of cloisters in England, as well as France, were not only filled with scriptural stories, in series, in stained glass, but the walls were sometimes painted in fresco. The walls of our mediæval castles, as far as the state chambers were concerned, were covered with wainscot, painted in fresco upon the panels, where not otherwise hung with tapestry. The church-warden renovators of our ecclesiastical buildings in the seventeenth and eighteenth centuries destroyed, by their white-washing processes, many fine specimens of wall-painting and fresco-work. In some instances, careful manipulation on the part of artists and architects has succeeded, says the *Brick and Tile Gazette*, in saving the fresco-painting, but in many cases the thin coat of plaster forming the ground of the painting unfortunately came off with the coat of outside white-wash. An older system of plastering, known as pargeting, or pergeting, was once very general. The term, as it is known in the present day, only applies to coarse plastering inside chimney flues, and between joists of floors. Formerly pargeting was understood in several senses: sometimes it was plain plastering, but generally it was used in connection with ornamental work, including mouldings, figures, foliage, and various other enrichments, sunk and raised. The Elizabethan half-timber houses exhibited on their exteriors ornamental pargeting betimes. In different towns throughout the kingdom houses formerly of the date to which we are referring displayed small figures, and canopies surmounting them, executed in plaster work. The plasterer may put in a claim for much good work in the past as well as an alliance with distinguished artists. The plasterer in the case of fresco-painting had always to be in readiness to render the wall with a coat of coarse stucco formed of lime and sand, which was finished over with a finer material to produce the requisite surface for the artist. Though the ancients were ignorant of the use of oils and varnishes, the fresco-painter, from the very nature of his work, had to evidence marvelous dexterity and skill, rapidity of execution, and a truly educated eye, all these being essential in the efficient performance of his labor. His subordinate, the plasterer, no doubt felt an inward pleasure, at least, that he prepared a good ground or basis for the successful work that resulted.

Of the class of plaster work known as stucco proper, there are several excellent examples in England and Ireland, generally attributed to Italian artists, several of whom were encouraged to settle in these kingdoms by members of our native nobility and some others interested in architecture.

In London and Dublin, in the old town mansions, and in numerous country seats, there is often splendid stucco ornamentation to be met with in ceilings, mouldings, chimney-pieces, etc. From the latter end of the seventeenth century, a very large amount of stucco ornamental work was executed throughout the three kingdoms, and though a portion of it must be put down to the hands of Continental artists, still we have evidence enough to show that our native workmen or artists in stucco often rivaled the foreigner in this class of plaster work. To one Margaritone, who died early in the fourteenth century, is credited the invention of stucco work. At intervals down to the end of last century he was succeeded by a number of clever stucco artists. The names of a few stucco artists or workers of more than ordinary repute, who practiced their art with fame and profit in London and Dublin, may be found in looking into some local histories. There is an inferior kind of stucco work well known to our modern builders and plasterers, made up of common mortar and plaster, which is applied to the outside of houses. This kind of stucco or "compo," if well made and manipulated, will last for several years, but the ordinary mixture called "stucco" has no tenacity, and a few nights of frost signs its death warrant. Such constituents as a composition of pulverized white marble, mixed with good plaster of lime, well sifted and wrought up to a proper consistency with water, show at once to the practical mind that the essentials for executing lasting work are present.

The half-timbered domestic-buildings, or cage-work structures, so plentiful in London up to the date of the great fire, afforded not a little work for plasterers, though the general run of the work of the more common and numerous class of these buildings consisted of filling in the interstices of the frame-work with plaster. The cornices, instead of being run in plaster, were often of wood, and put up by the carpenter and joiner; but when brick-built houses became general in our cities and towns, the house-plasterers by degrees secured a fair share of the work.

Old building practices, like national pastimes and customs, take a long time to die. The builder of the mud cabin still flourishes in portions of her Majesty's dominions, and the thatcher still turns our good ornamental work, as well as the tiler. After long centuries the "cob" wall constructor, the dauber, the rustic carpenter, the hedger, and the dry-wall field mason still vegetate, and find paying patrons. History is repeating itself, for have we not men coming forward again to prove that reeds are better than laths for plaster work, forgetting that our great-great-grandfathers used the vegetable growth, and never thought it worth while seeking a patent to protect its use?—*Building News* (*London*).

Excavations conducted at Sunium by the German Archæological Institute have been handsomely recompensed. All of the ground plan of the Temple of Athens has been disclosed, and it is now put beyond all doubt that the longer side of the building had thirteen columns, and not twelve. The remaining portion of the frieze has been unearthed, but, unfortunately, time has told disastrously with its sculptures. To the age of Pericles must be ascribed the marble temple, of the same general plan as the older and smaller structure, of calcareous tufa, over which it was built.

The Queen of England was the first to send a telegram to America. The message was one of congratulation to the President of the United States, who at once replied. Her Majesty's message and the President's answer cost £500 each, being £1,000 for the use of the cable for rather less than an hour and a half.

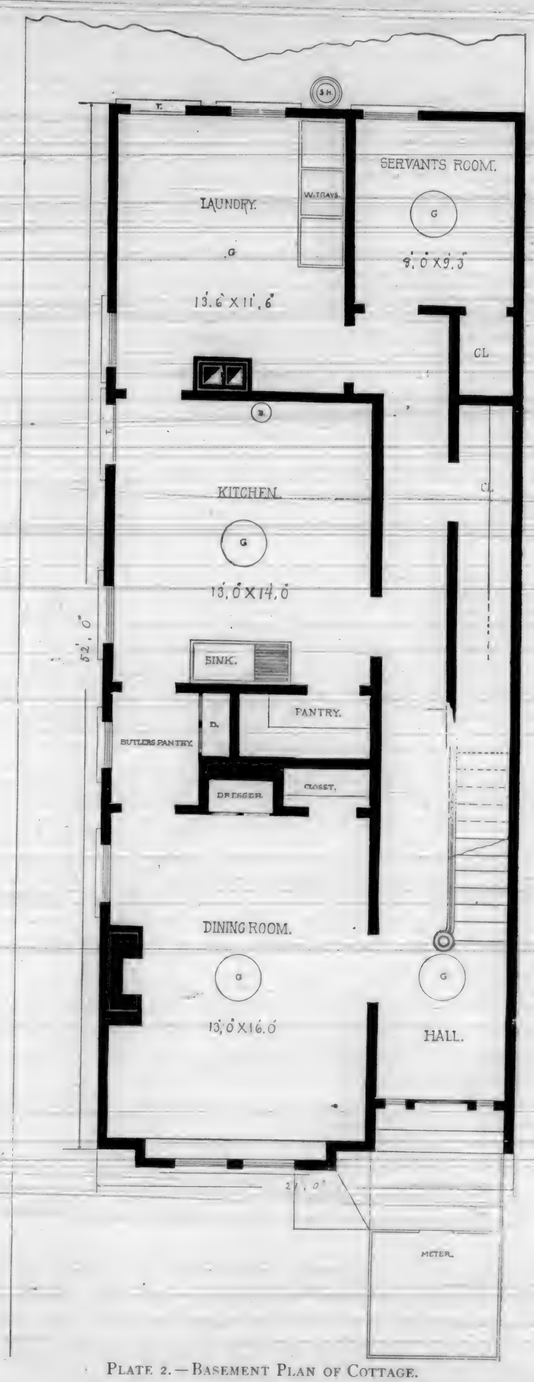

PLATE 2.—BASEMENT PLAN OF COTTAGE.

Early Plastering and Plasterers.

THE use of plaster, or "plaister," as it was formerly called, is of early date, even in the British Islands, in connection with domestic architecture. Long before lime plaster came into general use, a tenacious clay or sticky and unctuous earth was employed when procurable, and, in its absence, whatever clay, or mixture of mud and earth, produced the most binding material. The rudest and coarsest forms of daubing or plastering in the British Isles were those structures erected of wattles and daubed over with clay to keep out the cold. Her Majesty's message and the President's answer cost £500 each, being £1,000 for the use of the cable for rather less than an hour and a half.

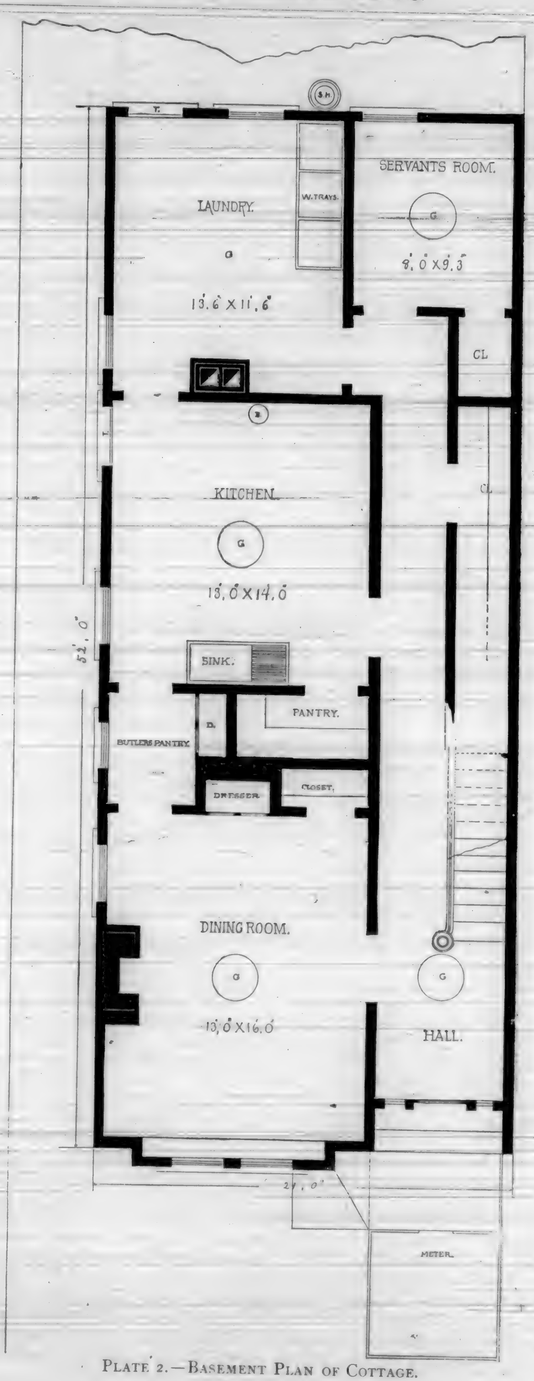

PLATE 2.—BASEMENT PLAN OF COTTAGE.

The Chinese Infliction.

It is not very difficult to understand why the people of the Eastern States are slow to accept the situation,—the living facts of every-day life on the Pacific Coast. There has been testimony sufficient adduced, and facts innumerable clearly proven, to convince any one who is not *unwilling to be convinced*, that the presence of the Chinese race in considerable number in any civilized community or county, is bad in every sense of the word—practically ruinous in ten thousand ways; and if not effectually and permanently restricted, will lead to results of the most damaging character, as far as the political, moral, and general interests of the country are concerned. If, step by step, and year after year, they increase in numbers, and the people of the United States tolerate their presence, and permit them to work into all the trades and avenues of manufacture and labor, and yield to them the rights and privileges of the people of the "most favored nations," the next that will follow will be enfranchisement and political rights It may require time to bring this about, perhaps a half century, but we have seen evolutions and results even as great, which within fifty years have brought about changes of the most gigantic character. Let the thoughtful mind run back over the ten past decades, and gather up, and put together all the facts and results of that period of time, and then dare to face the possibilities of the next half century, by an assertion that any stupendous change and overturning is impossible.

The Chinese are by no means "fools." They are the opposite of that,—cunning, artful, selfish, perfidious, untruthful whenever a lie will serve a purpose,—without a single moral sentiment that will not yield to the slightest temptation, and consequently a corrupt and dangerous element in both a political and moral sense to tamper with; and if permitted to gain a sustained and sustaining foot-hold—a position that will render them secure against the influences which are now so loudly demanding restriction, and contending against their encroachments upon and into the rights of the laboring, manufacturing, trading, commercial, and other interests of the country, the babes and infants of the present day will be compelled to encounter a condition of things which, if thrown suddenly upon the present men and women of the United States, would cause a rebellion of stupendous character, and cause a slaughter greater than has ever been in the world's history. The *men* of to-day could not be restrained or controlled, if the attempt was made to force them at once to accept a state of things such as the Chinese incubus is bound to bring upon their children, perhaps within a generation, if with impunity, as in the past, they are permitted to continue their aggressive methods, growing stronger and more potent and powerful with the years as they pass, encroaching upon, endangering, and undermining the life prospects, hopes, and comforts of millions of our own people, who seek to live as free men should live, in the enjoyment of this free and good land of liberty, where the laborer is worthy of his hire; and none should be forced to bow the knee to oppressive conditions, nor wear the yoke of perpetual servitude, as the result of competition with beings who know not, nor care for, any of the higher, more ennobling, and purer sentiments which actuate men and women of pure minds and holy purposes.

During the past thirty-five years, the rank seed of Chineeism has been planted, first upon the soil of California, where it has taken deep root and gained sturdy growth, with wide-spreading branches, and root tendrils shooting in all directions. They laugh at the clever ease with which they beat the laws of the land, and defy the legislative and judicial powers of the Government, swearing away and nugafying the enactments designed to fit their cases, and which, for all practical purposes, is perfectly clear and conclusive, except for the false swearing of the creatures themselves, and a word technicality which should be set aside as immaterial to the intents and purposes contemplated by the law-making power of a free and enlightened Government

Says a correspondent of the Philadelphia *Record*, writing from England: "The English are the best builders, I should say, in the world; they seem to like building; where we have a fence they have a wall; where we have a wooden jetty they have a stone pier; where we have a wooden sidewalk they have a granite pavement; we are in a hurry about everything, content with makeshifts; the English are never in a hurry, and they hate makeshifts. I reckon we lick the English in inventing things, saving labor, and in steamboats; and, except that I admire the little gardens to the humblest homes in England, I think Philadelphia can match the old country for homes; but, as I said before, solid is the word I should write down to describe England."

A Door That Cost $28,000.

One of the finest works of art in Washington is the bronze door of the capitol, which fills the doorway leading from the portico into the rotunda. It was modeled in Rome in 1858 by Randolph Rodgers, and cast in bronze at Munich in 1860 by F. Von Miller, at a total cost of $28,000. The valves of the door stand in a superbly enriched casing, also of bronze, and fold back into suitably fitted jams. In height it is nineteen feet, and nine feet wide, weighing 20,000 pounds. In 1862 this door stood in the south doorway of the old hall of representatives. In 1871 it was removed to its present situation, which is more appropriate, as it is now the front door of the capitol, and can be easily examined by strangers. Each wing of the door has four large panels, and eight smaller ones. The events portrayed in the larger panels constitute in *alto relievo* the principal events in the life of Columbus and the discovery of America, while in the sixteen smaller ones are beautiful statuettes of his patrons and eminent contemporaries. On the key of the arch is an excellent head of Columbus. In the casing are four typical statuettes, representing Asia, Africa, Europe, and America, while between the panels is a series of heads representing the historians of the life and voyages of Columbus and his followers, among them Washington Irving and W. H. Prescott.—*The Builder*.

Black Walnut Worth One Dozen Farms.

"If the original forests of the States of Indiana and Ohio were standing to-day," says a lumber buyer, "their valuation would be many times greater than are the farms which they were sacrificed to improve. In making their farms the settlers in those States destroyed millions and millions of dollars' worth of black walnut. Miles and miles of fence are laid with black walnut rails. One old farmer says that only thirty years ago he began making his farm, and that he had worked eight years in clearing it of the walnut timber, eight acres of which he burnt up. After thirty years of cultivation the farm is worth $8,000. If it had its walnut timber back it would be worth more than $100,000." The *Gazette* has several times referred to the tremendous destruction of timber which has been wrought by the hands of the farmers of the country, but regrets will not bring back the valuable stuff which has been reduced to ashes upon myriads of logging heaps. It is a case of cannot eat your cake and keep it. We cannot have improved farms and valuable timber tracts upon the same land.—*Lumberman's Gazette*.

September opened with a brisk trade in all the leading branches of manufactured goods, and the outlook is promising for the best fall business we have had for several years. Compared with the opening of September last year, there is a marked change. Then there was a halting, weak tone, and stocks of most wares were largely in excess of the demand; factories and workshops were stopping in all directions, and large numbers of people were out of employment in all the manufacturing towns. Now buyers are operating with confidence, prices of goods are advancing, and stocks have disappeared. In many instances the factories are behind their orders and some idle machinery has been started up. Fewer people in the manufacturing towns are idle for want of employment, and in some towns everybody that wants work can get it. The despondent tone has given way to a cheerful, hopeful spirit, and all are now confident that good times are coming. A glance at our reports will show that there is a solid foundation of facts for these statements.—*Brick, Tile, and Metal Review*.

The Annual Architectural Gatherings.

The American Institute of Architects will meet in annual session, October 21, 1885, at Nashville, Tenn. It is to be regretted that California and the Pacific States and Territories—particularly San Francisco—fail to furnish a single representative in that body, although the place of meeting has been made to some extent central, and so as to accommodate distances and equalize conveniences.

True, there are but a few of the many scores of architects practicing on this coast, entitled to a seat and active voting participation in the proceedings of the parent body; but it is very certain that any intelligent representative member of the profession being present, would be well received and entertained. The brethren East would gladly extend courtesies, and make the visit of parties representing this side of the continent exceedingly pleasant.

San Francisco Chapter should take this matter in hand, and at an early day arrange for a representation at the session of 1886. This extreme western branch of the profession has remained sufficiently long encased in its isolation. For many years the bar to commingling with the eastern sections of the country, was to a certain extent enforced by difficulty of transit and communication; but this has long since been removed, and the present facilities, conveniences, and speed of travel, render a trip East a matter of small moment. And if the Chapter should delegate representatives, it would be entitled to all the benefits arising therefrom, and at the same time strengthen the position of the party of parties representing

THE WESTERN ASSOCIATION OF ARCHITECTS.

This body also holds its session, October 18 at St. Louis. Great interest is manifest, and it is to be expected that a spirited and interested time will be enjoyed. Invitations have been extended to architects in California, and an earnest desire expressed to see a representation from this coast. The two conventions assembling about the same time—one on the 18th and the other on the 21st of the same month—will afford the opportunity to the delegates from each to mingle in the pleasures and profits of both, an opportunity that might have been made profitable to the profession in California had this city been present by representation.

Special Book Notices.

Cooper on the Use of Belting for the Transmission of Power, contains a large amount of practical and valuable information, with numerous illustrations. Its subject matter is treated intelligently, and with a clearness of comprehension that renders it a truly valuable book. Its matter covers 300 pages, 6x9, with ten pages of index additional. Thos. W. Hartley & Co., Phil., publishers' agents.

Grimshaw on Saws, with Supplement, by Robert Grimshaw. A book of 279 pages, neat and clear in typographical execution, and full of facts and figures in relation to saws. The number and variety of its illustrations add greatly to its interest. It contains a large amount of valuable information. Thos. W. Hartley & Son, publishers' agents.

A Manual of Industrial Drawings for Carpenters and Other Wood-workers, by W. F. Decker, instructor in drawings in the University of Minnesota. Published by W. F. Comstock, N. Y. Price, $2.00. *Sent by mail free of postage to any part of the world.* To be had at the office of this Journal at publishers' price. An excellent, practical book.

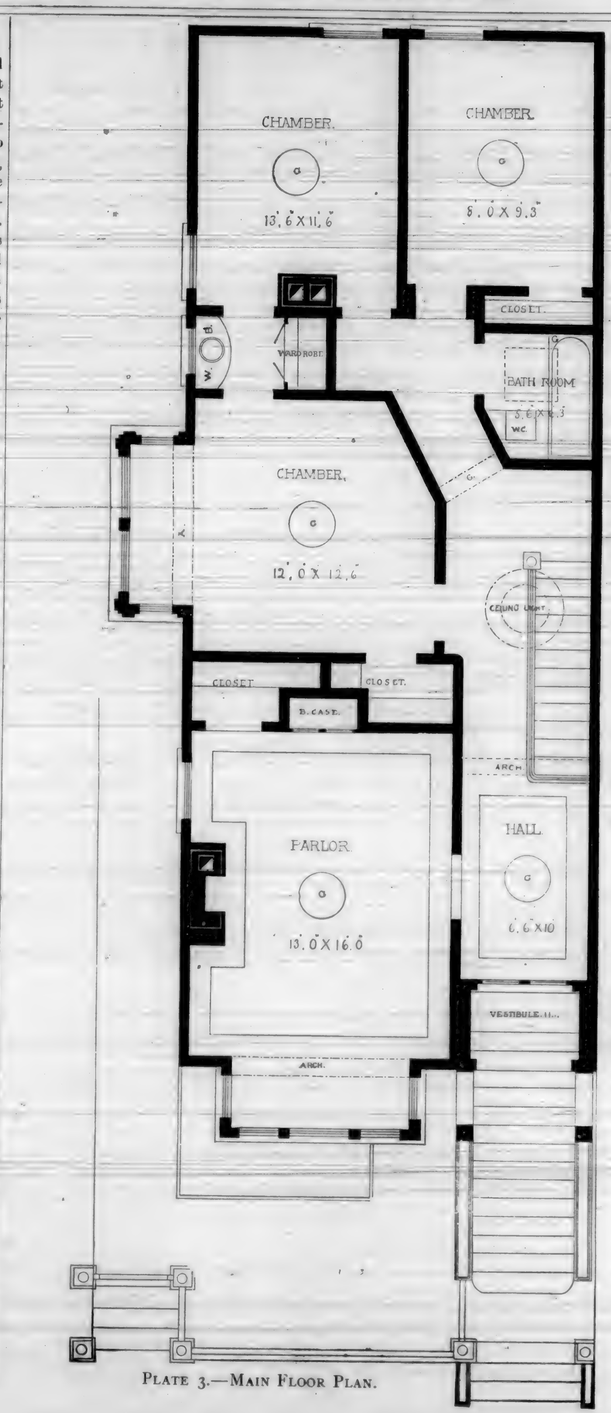

PLATE 3.—MAIN FLOOR PLAN.

Science of Architecture.

[Special for this Journal. By F. Hillert, Architect and Mechanical Engineer.]

(Continued.)

TWO BODIES, M and N, each of a different temperature, are in contact with each other, the one M, the warmer, will transmit or pass heat to N, the colder, through the surface of contact, to be absorbed by N. If N is cut up in equal small slices parallel to F, the surface of contact, and in each of the slices exist a uniform temperature, but differing from each succeeding one, then the slices will the more apart, with a better conduitivity of heat of the material. A motion of heat from M, the hotter body, through F towards N, will occur.

If the surface of a hot body emits or radiates heat to the surrounding colder medium, such emission is depending on the condition of the surface of the body.

By the emission or giving over of heat to a body, such may be done, by radiation or by conduitivity (contact with the surrounding medium). Is named with:—

r, the heat given over by radiation per hour, and □ meter (10.76 59. feet).

V_1, the heat given by conduitivity per hour, and □ meter.

T is the temperature of the surrounding medium.

t is the overplus of temperature of the emitting surface over the temperature of the medium.

k = a coefficient, depending on the condition of the surface of the body.

k_1 = a coefficient, depending on the shape and extension of the surface.

a = a constant = 1.0077.

b = constant = 1.233.

Then is:—

v = heat transmitted by radiation =

$$124.72k \times a^T(a^t - 1).$$

v_1 = heat transmitted by conduitivity = $0.552\ k_1\ t^6$, and the whole heat transmitted.

$V = v + v_1 = 124.72ka^T(a^t - 1 + 0.552k_1\ t^6.$

Values of k for the coefficient of radiation:—

Polished silver	0.13	Glass	2.91
Silvered paper	0.42	Pulverized chalk	3.32
Polished brass	0.258	Saw-dust	3.53
Gilded paper	0.23	Powdered coal	3.42
Copper	0.16	Fine sand	3.62
Zinc	0.24	Coat of oil paint	3.71
Tin	0.215	Paper	3.77
Polished black sheet-iron	0.45	Lamp-black	4.01
Leaded sheet-iron	0.65	Building stone	3.60
Common sheet-iron	2.77	Gypsum	3.60
Roasted sheet-iron	3.36	Wood	3.60
New raw iron	3.17	Woolen stuff	3.68
Roosted "	3.36	Calico	3.65
		Silk stuff	3.71
		Water	5.31
		Oil	7.24

k_1 is depending on the form and extension, and is:—

For a sphere of the radius r, $k_1 = 1{,}778 + \frac{0.13}{r}$

For a sphere, $k_1 = 1.778 + \frac{0.13}{r}$ of radius r = r.

For a horizontal round cylinder of radius r,

$$k_1 = 2.058 + \frac{0.0382}{r}$$

For a vertical cylinder of radius r and the height h,

$$k_1 = \left\{0.726 + \frac{0.0845}{\sqrt{r}}\right\} \times \left\{2.43 + \frac{0.8758}{\sqrt{h}}\right\}$$

From the following table the values of v and v_1 for the different overpluses of temperature (t) can be computed, where by T is taken = 15°.

T = 0	10	20	30	40	50	60	70	80	90	100 deg.
0.89	0.96	1.04	1.12	1.21	1.31	1.41	1.52	1.65	1.78	1.92

then the following figures in the table must be multiplied with

Overplus of temperature (t), degrees.	Transmission by Radiation.	Transmission by Conduitivity.	Overplus of temperature (t), degrees.	Transmission by Radiation.	Transmission by Conduitivity.
10	11.2k	9.4k$_1$	40	269.5k	244.3k$_1$
20	23.2k	22.2k$_1$	50	302.1k	266.1k$_1$
30	36.1k	36.6k$_1$	160	339.0k	288.1k$_1$
40	50.1k	52.2k$_1$	170	277.4k	210.5k$_1$
50	65.3k	68.6k$_1$	180	418.5k	333.2k$_1$
60	81.7k	86.0k$_1$	190	463.2k	356.1k$_1$
70	99.3k	104.0k$_1$	200	411.2k	379.4k$_1$
80	118.5k	122.6k$_1$	210	563.1k	402.9k$_1$
90	138.7k	141.7k$_1$	220	619.0k	426.7k$_1$
100	161.3k	161.5k$_1$	230	679.5k	450.7k$_1$
110	185.3k	181.5k$_1$			
120	211.3k	202.1k$_1$	240	744.8k	475.0k$_1$
130	239.3k	223.1k$_1$	250	848.7k	498.6k$_1$

For the transmission of heat, those cases are most important where two parallel equal distanced surfaces are surrounded and in contact by mediums of a different temperature, where the overplus of heat of the one medium transmits heat to the other through the separating body. The transmitted quantity of heat M must be equal to the heat transmitted to the medium facing the colder surface.

If we name

e, the thickness of the transmitting body, the distance between the absorbing and emitting surface.

t, the temperature of the heat-emitting medium = to the heat-absorbing surface.

t', the temperature of the heat-emitting surface.

t'', the temperature of the heat-receiving medium.

C, a coefficient, depending on the capacity of the body to conduct heat,

Then is:

$$M = \frac{C(t - t')}{e} \text{ wherein}$$

$$C = \frac{e\ (k + k_1)\ (t' - t'')}{t - t'}$$

Table for the values of C of the different bodies pro 1 honer 1 sq. meter = 10.76 ft. 59 e = 1 meter, 3.28 ft. $(t - t') = 1°$

Gold	77.	Cork	0.143

" fiber	0.170	Cotton	0.040
Walnut cross-g. parallel fiber	0.103	Carded wool	0.044
" fiber	0.174	Elderdown	0.039
Oak cross-grain	0 211	Linen	0.043–0.052
		White writing paper	0.043
		Gray printing paper	0.034

A body, composed of many layers of thicknesses, e, e', e'', and the conducting capacity C, C', C'', will have

$$M = \frac{t - t'}{\frac{e}{C} + \frac{e'}{C'} + \frac{e''}{C''}}$$

A scrutiny of the radiating and conducting capacity of the different bodies, as solid or in a pulverized state, shows a large difference, the movements of the heat being retarded by the air between the small particles.

A conservatory of 1 sq. meter surface of glass, the outside temperature being 20°, the required inside temperature being 40, the whole heat emitted by radiation and conduitivity is

$Q = v + v_1$; $v = 23.2 \times 2.91 \times 1.04 = 70.21$.
$v_1 = 22.2.\ 0.88 \times 1.04 \times 20^{\circ} = 40.62$.
$Q = v + v_1 = 110\ 83$ caloric per hour and square meter, or 10.76 square feet.

HEATING AND VENTILATION.

The quantity of heat acquired pro unit of time (one hour) to warm a room is depending on the capacity of transmitting heat, viz., on the kind and thickness of the surrounding wall inclosing the room (walls, windows, doors, floor, and ceiling), and the difference between the temperature wanted in the room and the temperature existing outside of the inclosing wall.

For the most important instances for practical application, the needed amount of transmitting heat can be calculated by the following rules. The terms therein given are:—

M = to the number of units for heat (caloric) which for every hour every square meter = 10.76 sq. feet through a body with parallel sides (wall, plate) are transmitted.

C, the coefficient of the conducting capacity of the material.

k, a coefficient depending on the condition of the surface.

k', a coefficient depending on the form and extension of the body; the sum of $k + k_1 = Q$.

T, the temperature in centidegrees desired in the room to be warmed.

t, the temperature the transmitting body is exposed to on the outside.

e, e', e'', the thickness of the parallel stratas the transmitting body is made off, measured from the heat-receiving strata to the heat-distributing surface of each strata.

1. Transmission of heat through the walls or doors of a room, when all the walls are not exposed to the outside air.

$$M = \frac{C, Q\ (T - t)}{2\ C + Q\ e}$$

2. Transmission of heat through single windows, not all of them being exposed to the outside air.

$$M = \frac{Q\ (T - t)}{2}$$

3. Transmission of heat through plain glass walls, all of them being exposed to the outside air.

$$M = \frac{Q\ k_1\ (T - t)}{Q + k_1}$$

4. Transmission of heat through double sash windows of a room, not all the walls containing them are exposed to the outside air.

$$M = \frac{Q\ (T - t)}{2 + 1}$$

5. Transmission of heat through the ceiling of a room—

$$M = \frac{Q\ (T - t)}{2 + Q\left(\frac{1}{Q} + \frac{e}{C} + \frac{e'}{C'} + \frac{e''}{C''} \cdot \cdot\right)}$$

By inserting the values before given for the radiating or conducting coefficients, and for a difference of temperature $(T - t) = 1$, we obtain by these formulas the following figures:—

For. 1; a, for a brick wall.

Thickness of Wall. m, or feet.	Transmission Value. M.
0.125 (5")	1.80 cal.
0.25 (10")	1.20 cal.
0.38 (15")	1.04 cal.
0.51 (20")	0.86 cal.
0.64 (25½")	0.73 cal.
0.77 (30⅜")	0.63 cal.
0.91 (35⅞")	0.55 cal.
1.04 (41")	0.49 cal.

B, for wood in doors.

Material.	Height of Door.	Thickness of Door. 0.040m (1⅝")	0.050 (2")
Pine	3m (9'10)	2.55 cal.	2.50 cal.
Oak	3m (9'10)	2.72 cal.	2.49 cal.

Ad 2, for single windows.

Height of Windows.	Transmission.
2m(6'6")	2.56 cal.
3m(9'10")	2.52 cal.
4m(13'1")	2.50 cal.
5m(16'4")	2.49 cal.

Ad 3, for glass walls.

Height Glass Walls.	Transmission.
2m(6'6")	1.54 cal.
3m(9'10")	1.49 cal.
4m(13'1")	1.47 cal.
5m(16'4")	1.45 cal.

Ad 4, for double sash windows.

Height of Windows.	Transmission.
2m(6'6")	1.70 cal.
3m(9'10")	1.68 cal.
4m(13'1")	1.66 cal.
5m(16'4")	1.65 cal.

Ad 5, for ceiling.

For a ceiling of 0.3m (11.81") thickness we find the value of transmission 0 5 cal.

The above formulas and the values calculated, with their assistance, must practically be applied with some allowance and consideration, since the conditions under which those formulas were made can't exist in reality. For example, the transmission is considerably influenced by the position of the transmitting body towards the quater of heavens, through rain, wind, state of moisture of the atmosphere, the air, sunshine, by the special quantities of the material and the quality of work executed, etc. The given formulas are only guilty for a state of continuation and uninterrupted use, which in reality is seldom the case. For a room seldom heated and only used for a short period, the calculation for a heating apparatus for the heat needed hourly, the question in the firs place is, not as much the transmission of heat as the absorbtion of the same by the walls (churches, halls, etc.), to be considered.

To have, under the common conditions, a support for the approximate calculation of the losses of heat, it will be well to increase the values obtained by the formulas; for room facing north and east, by 10 per cent, and multiply all values of M with respectively:

1.1 when the heating is carried on uninterrupted.

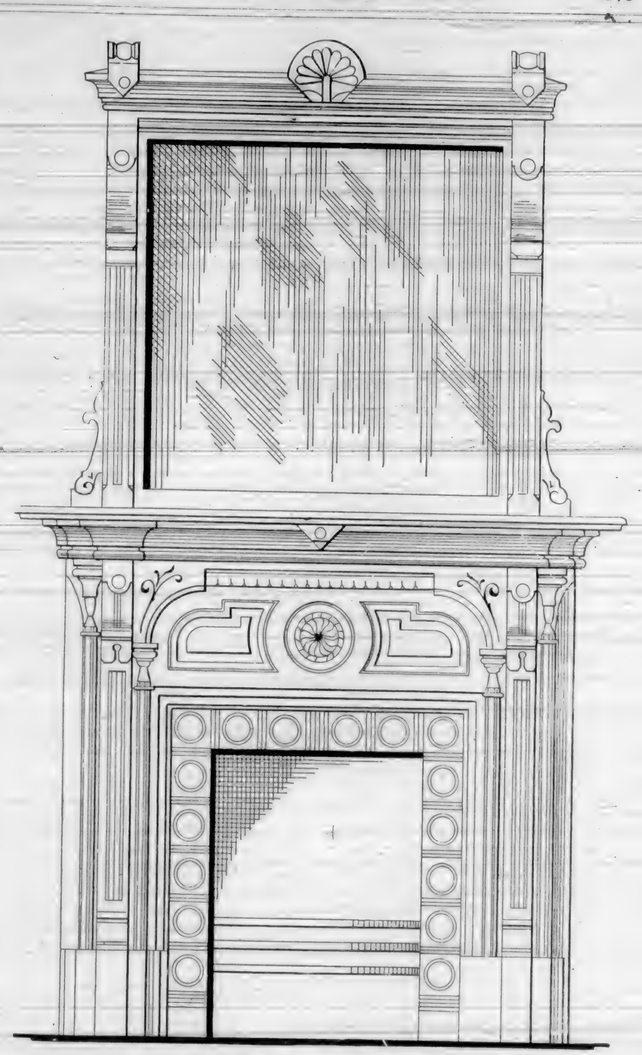
1.2 when the heating is carried on during daytime, and the building having no sheltered position.

1.3–1.4 when the heating is carried on during daytime, and the building having a much exposed position.

1.8–2.00 when the room is only periodically heated.

From the above calculated amount of heat can, when the room is occupied by a certain number of persons stopping in it constantly, or for a longer time, that quantity of heat be deducted created by them, and for which we can allow 130 cal. of heat for a grown person per hour, and 70 cal. for a child.

Suitable temperatures T for room to be heated, are:—



DESIGN FOR LOW CAST MANTEL.

For heating rooms, halls, theaters, etc.	16°–18° cal.
Living rooms	18°–20° "
Bedrooms	15°–16° "
Stair corridors	12°–15° "
Hot-houses { warm	20°–24° "
Hot-houses { cold	10°–14° "
Hospitals	20°–22° "
Prisons	16°–18° "
Workshops	10°–12° "

For t, the temperature of the outside atmospheric air, we have to consider the climatic condition of the country, since the heating arrangement must fulfill its functions with safety under all conditions.

FUEL.

Of the three kinds of fuel, the solid, fluid, and the gaseous, the solid is by far the most in use, inasmuch as late attempts to introduce the gaseous were, so far, not successful.

As stated before, and in connection with the application to be repeated, hydrogen and carbon are the heat-producing elements of the fuel, which, by perfect combination or oxidation, taking the required oxygen from the air, are reduced to water and carbonic acid, but by imperfect combustion, under considerable loss of heat, are reduced to oxide of carbon, oleifiant, and water; both instances leaving ashes as residue from the incombustible inorganic substances of the fuel.

The Master Painters.

THE regular monthly meeting of the master painters was held on the 6th inst., Mr. E. M. Gallager occupying the chair. The aims and objects of this organization are to protect mutual interests, and remedy existing evils in the painting art; and, as far as possible, purge it of the influences which have rendered it next to impossible for thoroughly competent and trustworthy men to secure work at prices sufficient to enable them to pay for the stock used and the labor employed.

There is no question but that there are some terrible frauds in the painting business, who manage to manipulate compounds bearing but the semblance of genuine lead and oil paint, and who "play it on owners" to a disgraceful extent. The report of proceedings states: "It has been one of the crying evils, for many years, that property owners have sought in vain for protection against the use of vile materials. Hundreds of private dwellings in this city are to-day blistered and cracked from the use of inferior stock—notably one on Nob Hill, which is in a wretched condition, and is being overhauled."

This outcry against the "slop shop workers" is all very well and right, as against the *bastard* painters, but owners are also to blame—inasmuch as they, as a rule, are willing that every fellow who calls himself a painter, although in very fact the merest dauber, should compete with competent men; and they—possessing neither the integrity nor the ability to do good work, figuring below all reasonable and right values in eight out of ten cases - so far underbid the good men (often to the extent of fifty to one hundred per cent), that the amount seemingly saved to the owner dazes his better judgment, and he submits to the chances, both as to materials and workmanship.

This mistaken course on the part of owners is damaging alike to themselves and qualified mechanics; to themselves in that they pay money for a worse than worthless something—a something that has neither merit nor value, and which, when used, becomes a continuous annoyance and vexation. For when a man realizes that he is the martyr of a bad job of painting, it is impossible for him to reconcile himself to the fact, excuse it, and be satisfied with it. It haunts him ever, and he cannot forget one of two things: either, "What a fool I was to give the job to that man;" or, "That rascally painter swindled me badly," neither of which propositions are pleasant reflections.

If owners would exercise better judgment, and a little more liberality, they would secure better work. But unfortunately, as a rule, when the contrast is presented of $675 or $962, as against $1,075 or $1,680 respectively, the difference has a powerful effect and influences in determining issues, and qualifying preconceived purposes and resolutions not to contract with nor employ any but first-class painters.

The objects of the organization are, however, to be commended, in that it is seeking to correct a great wrong and evil existing in the painting business, and to stimulate integrity and correct dealings in the use of materials and otherwise, and inspire ambitions among its members to learn and know what is best to do, and how to do it, and to exercise that knowledge rightly, honestly, and faithfully in every transaction.

It is to be hoped that the better men will consolidate determinations and efforts, and work unitedly as against the manipulations of slush and fraudulent compounds, by the use of which they gain an advantage in figuring over men who have "learned the trade," and who are unwilling to disgrace themselves and the pursuit of their choosing by resorting to any of the numerous dishonest and un-mechanical devices by and through which the "cheap" operators obtain a large proportion of the contract work let in San Francisco.

Figures in Wood by Compression.

A NEW process has been invented by which designs in wood, having all the appearance of genuine carving, and being if anything of a finer finish, are produced by compression, and can be sold at a nominal price. The process consists in paring hard-wood shavings as thin as wafers, which are then placed in a chemical solution. When in a properly pliable condition, the mass is introduced into moulds made from steel plates, and pressure is applied, which forces the wood pulp in every line of the mould. When it becomes dry, it is removed from the mould, and has exactly the appearance of a wood carving, with the grain of the wood as perfect as though it had never been reduced to a pliant condition. The process is a German invention, and large numbers of different designs are now being manufactured in Berlin. These are in form of heads, figures of men, women, birds and animals, flowers, picture and mirror frames, clock frames, cabinets and cabinet decorations, album covers, etc. Beautiful designs are framed in brass, bronze, and plush, and make exquisite plaques and parlor ornaments. The designs can be used in every form of decoration for which wood carving is suitable.—*Furniture Worker.*

When the architects and builders of churches learn that ventilation does not consist in a draught of cold air, and that something more is necessary in a crowded building than an open door or window, one very great danger to health will be removed. This subject of ventilation has received much practical attention of late, in which the churches seem to have been largely left out of the account. An open door, or window, in such a building usually means a current of cold air, which must inevitably blow directly on the necks and shoulders of many people, at least one-half of whom will either take cold or suffer twinges of rheumatism or neuralgia in consequence. Very few people, even in robust health, can sit in a draught without uncomfortable consequences, and delicate people more frequently "tempt Providence," as the saying goes, by sitting in a church where some zealous lover of fresh air throws open a door or lowers the upper sash of a window without a thought of the consequences, than they would by staying at home. The writer attended a church last Sunday where study and expense had not been spared in the interior decoration. The olives and blues, brightened with a touch of gold on wall and vaulted ceiling, were soft and restful to the eye. The seats were comfortable, the organ and choir satisfactory. But when the air grew heavy, and people moved about uneasily to keep themselves from drowsiness, one looked in vain for some adequate means for supplying freshness and life to the tainted air. At last, somebody opened a door at the back of the church, and there was no lack of fresh air, only it struck the heads and shoulders of every one in its path and effectually distracted attention from the sermon. People moved more uneasily than before, and no one had a monopoly of stinging neuralgic pains in back and shoulders for the rest of the day. If this were an exceptional case it would be of comparatively little importance, but it is so common a thing that it demands attention and remedy. If it is wrong to place one's self voluntarily in a position where health and, often, life are in danger, it is manifestly far more reprehensible to construct a church building, where people will go and ought to go, without proper thought or knowledge of this important matter. Clergymen will find their work very greatly advanced, and some of the stumbling blocks of coldness and indifference speedily removed, when pure air is properly and constantly furnished to their hearers without danger to health and comfort.—*Sanitary News.*

The London Tower.

IN the future, it would seem, the Tower is to be, even more than in the past, one of "the sights o' London." It is to be divested entirely of its utilitarian character. The rifles in the Armory are to remain, but the whole of the large store of arms is to be removed to the central depot at Weedon. This, we are told, is in fulfillment of a desire that the Prince Consort had very much at heart—a desire that the Tower should be preserved wholly and simply as a building remarkable for its architecture and for its historical associations. In accordance with this view, the barrack and hospital stores were removed in 1869, and the accoutrements a few years after. The workmen, of course, went also, and now the building will be deserted, so far as permanent tenants are concerned, by all save the small garrison which has always been maintained there. The arrangement will probably meet with general approval. It is, perhaps, as well to separate in this case the practical and the sentimental elements. The maintenance of the useful functions of the Tower means, of necessity, wear and tear, to which it is, no doubt, desirable that the building should no longer be subjected. There is very much to be said for keeping such famous old places as the Tower in as perfect a state of preservation as possible. We can find plenty of localities for the storage of arms, but we cannot adequately repair any damage which may be done to our ancient historical landmarks. We can "restore" them in one sense, but not in another.—*London Globe.*

The Russian Admiralty has ordered that twelve gunboats shall be immediately provided with furnaces for burning mineral oil instead of coal. The substitution of petroleum for coal for steam-ships is progressing rapidly. Already there are upward of three hundred steamers burning this liquid fuel, and their number is being added to almost daily. This is a matter that must even now affect the coal trade in an appreciable degree. It is reported that the owners of an important line of steamers from England to Australia are likely to adopt oil furnaces shortly. The space occupied by the oil for a given effect is scarcely more than half that required for coal, an advantage of great importance in long voyages The oil can be taken in, too, in much less time than coal. Hitherto no accident has occurred with this fuel.

A sudden rise in the Snohomish River, W. T., lately, broke the Pilchuck boom and let loose 1,500,000 feet of logs. The whole lot went out to sea. About 1,000,000 feet were saved and turned into Ebey Slough, 100,000 feet going out on ebb-tide and drifting into Port Susan Bay. Through the breaking of other booms it was thought that not less than 2,000,000 feet of logs went out to sea, about three-fourths of which were saved.

Sewerage—Berlin.

SOME idea of the effect which the inauguration of a system of sewerage has upon the sickness-rate of typhoid fever may be gained by studying the results already attained in Berlin. Durand-Claye has recently published a description of the new system, in which he touches upon its effects upon the health statistics. It may be stated that the system has been put in so far, in the most crowded sections of the city, leaving the more open suburban portions of the town still unimproved in this regard. It may also be stated that Berlin is eminently a city of apartments and tenements. The average number of people living in one house in Berlin is fifty-eight In the suburbs, of course, the number is much less than that. The number of cases of typhoid fever in a stated time, in that part of the city where the sewerage is not yet put in, was one to each nine and three-tenths houses, while in the sewered portion in the same time, there was but one case to each forty-nine and three-tenths houses. The deaths from the disease bear out the conclusions derived from the sickness reports. In the unsewered portions of the city the deaths were one to each forty-three houses, while in the sewered portion the deaths were one to each one hundred and thirty-seven and five-tenths houses.—*Sanitary News.*

The fire waste in this country for the past few years is something fearful to contemplate. Probably few persons stop to consider what this amounts to in the aggregate, and few, comparatively, are aware that over $100,000,000 worth of property is sacrificed to the fire fiend every year in this country. This is equivalent to the annihilation of so much in actual values, which are taken, directly or indirectly, from the pockets of the people, either in premiums to the insurance companies, or in taxes to support fire departments. And the worst feature of it all is that the greater portion of this loss is wholly preventable. The poor character of buildings, carelessness on the part of owners or occupants, or want of adequate protection, are among the causes which lead to many of the disastrous conflagrations. In Philadelphia the underwriters have determined upon the selection of approved experts who are to visit properties and require improvements, and make re-examinations every six months.—*The Indicator.*

It is stated that the work on the new State House at Austin, Texas, will progress rapidly after Jan. 1. The foundations and basement are now completed, and a new railroad fourteen miles long has just been built to connect the site of the capital with the quarries from which the granite to be used hereafter in the construction of the building is to be procured. Contracts for iron and other building material have not yet been closed.

Taxes and Manufacturers.

THE prodigal waste of money raised by taxation in large towns and cities frequently has a depressing effect on manufactures. In many cities there appears to be a regular increase in tax rates, which is likely to stop no one knows where. Such a state of affairs prevents the location of manufacturers, for the sufficient reason that they cannot compete, under the load of taxes imposed, with those more favorably situated in this respect. This is something never considered so fully as it should be; it is a strong plea for honesty and business principles in the expenditure of money raised by taxation. Nothing places a town or city in better condition to meet necessary taxation than the presence of large manufactories, distributing money to a large number of workmen.

In some of our Northern and Eastern cities the tax rate is three per cent, and increasing year by year. It cannot be expected that manufacturers will be anxious to establish themselves where they will be burdened, or overwhelmed, with such a load; on the contrary, those already there will be likely to consider the propriety of moving elsewhere in self-defense. Other towns and cities, alive to the advantages, offer to abate taxes altogether for a term of years; with honest and business-like methods of officials, we do not believe there would be any need of resorting to this last-named expedient, the justice of which is, to say the least, questionable. Manufacturers do not object to bearing their share of public burdens, but they do object to taxation about equal to profits they would be satisfied with. In such times as we have been passing through, this burdensome taxation is, in many instances, where business has been done at little or no profit, unbearable. We commend this view of the case to the law-makers. In too many instances they seem to lose sight of the fact that, when they succeed in driving away manufacturing, they will not find it easy to raise even the money required for the honest administration of affairs.—*American Machinist*

Old Files That Look New.

ACCORDING to the *Sun*, the Kearney & Foote Company, one of the largest manufacturers of files in the country, have lately received complaints of worthless goods bearing their trademarks. Recently one of their agents learned that a Jersey City dealer had had an offer of a large lot of files at remarkably low figures. The would-be seller represented that he had secured a supply of files at a sale of unclaimed express packages. An arrangement was effected which secured the presence of a detective, when two men called at the dealers and effected a sale.

Receipted bills showed that the sellers had purchased large quantities of scrap files from the Singer Manufacturing Company. An acid process gave the worn-out files a new appearance. A trial showed they would hardly cut lead, the acid having ruined their temper.

MASONS' AND BUILDERS' EXCHANGE
OF SAN FRANCISCO

Room 11, 314 Montgomery St.

BELOW will be found a list of the members composing this Exchange. Boxes are provided for each member, so that architects, owners, or others desiring the services of any particular member, or those having boxes who are not members, and yet whose business is directly connected with that of the Exchange, can readily secure the attendance of the party sought, by leaving a note in the respective boxes.

IN NEW YORK.

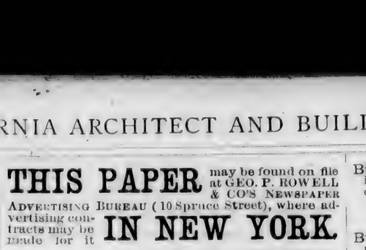
Partial List of Books on Sale.

We have a list largely to our line of architectural, mechanical, scientific and other works, and shall carry a very complete stock, among which will be found:—

The Wonders of the Slide Rule $3 00
Carpenter and Joiner Modernized 7 50
Lessons on Hand-railing for Learners .. 5 00
Mechanical Geometry 5 00
The Artisan 5 00
Handbook of Legendary and Mythological Art, by Mrs. Clement. Contains much interesting reading 3 00
How to Build, Furnish, and Decorate ... 5 00
Practical Carpentry 1 00
More Universal Assistant. A good book 2 50
Treads and Risers. Every carpenter and stair builder should have one 50
Stair Building Made Easy 1 00
Wright's Practical Perspectives 3 00
Leffel's House Plans 2 50
Modern House Painting 5 00
Art and Science of Saw Filing 75
Art and Science of Carpentry Made Easy 5 00
Practical Lessons in Architectural Drawings 2 50
Builders' Guide and Estimate Book 2 00
Bricknell's Street, Store, and Bank Fronts 4 00
Plaster and Plastering 1 00

And a much greater number which space will not permit mention in detail.

The books above noticed, or any others published in the English or any other language, can be had at publishers' prices at the office of this Journal.



NOTE.—*To Architects, Owners, Contractors, and Builders:* The information comes to us from many sources, that parties at present in no way connected with this Journal or office, sometimes, if not frequently, use its name in soliciting and obtaining building intelligence, and, in some cases, matter intended for its columns has been diverted. As a protection against this unfairness, authorized canvassers will be provided with printed forms in book shape, bearing the name of the CALIFORNIA ARCHITECT AND BUILDING NEWS, without which there is no authorization from this office to any one, no matter what his name, or what may have been his former relationship with this Journal.

Where owners' names are left blank, it is so done in most instances by special request

A

Ashbury, bet. Waller and Frederick. Two-story frame.
O.—C. A. Hooper.
A.—Percy & Hamilton.
$10,000.

B

Brannan, No. 270, nr. Second. Alterations.

Building Report.

THE current month, ending the 10th inst., shows a marked decline in the number of new building engagements, and a diminished sum of costs. This is not to be wondered at, for the two prominent reasons: *First*, the "wet season" is upon us, and, as has been the case in all preceding years, serves as a damper in checking building activities. *Secondly*, the "*boom in building*" has been such that a continuance at the high pressure reached during the season could not be kept up under any natural, reasonable state of things. It would require increase in population of large proportion to sustain the activities of preceding months. Still the showing is good for the season.

NOTE.—The reports appearing in this Journal are as near the SOLID and RELIABLE facts as care in collecting, and truthfulness in stating, can make them. If we were to pick up every side-walk or other small job of $150 or $350, and report them from three to five times the amount of actual cost, and republish items of building news reported three or four months previous, it would alike swell the apparent number of improvements and outlays in buildings. But our object is to confine ourselves to the strict order and condition of facts as they exist, deeming it a wrong to bolster up, or make appear, that which does not appear in fact. The future of the great city of San Francisco is sufficiently well assured to need no fictitious additions to the actualities that exist.

The number of buildings for the current month, ending November 10:—

85 new frames, total cost	$286 550
19 additions and alterations	41 150
3 brick structures	38,000
107 engagements. Total cost	$365,700

Although this is a greatly diminished showing as compared with preceding months of current year, it is not so reviewed with the same month's report in 1884, which gave the total number of buildings at 101, and the total cost at $418,226.

(See Building Intelligence for itemized report.)

Compressed Timber.

A NEW process for toughening timber is announced, by which it is claimed that whitewood can be made so tough as to require a cold-chisel to split it. This result is reached by steaming the timber and submitting it to end pressure, technically "upsetting" it, thus compressing the cells and fibers into one compact mass. It is the opinion of those who have experimented with the process that wood can be compressed 75 per cent, and that some timber which is now considered unfit for use in such work as carriage building could be made valuable by this means; and more especially since the rapid consumption of our best ash and hickory will sooner or later render some substitute necessary.

Oakland Report.

FROM this on, a carefully prepared report of building intelligence in Oakland, Alameda, and Berkeley will appear in each issue. To do this with accuracy, it will be necessary for the architects, owners, contractors, and others interested, to render us the little assistance required in furnishing figures and facts. It is to be regretted that architects of surly, vinegary disposition sometimes act as meanly as men can possibly act, just to gratify some morbid disposition of mind or stomach, refusing to give decent if any reply to questions which, if answered, would hurt no one, and be of interest to many. If an owner has a house built he cannot hide the fact, and should not wish to if the transaction is legitimate; and an architect can have no intelligent and proper excuse for withholding the facts in his charge, in so far as they apply to outward appearances—the improvement of real estate. The secrets of his profession and the private interests of his client should be respected; but outside of these—the erection of buildings in their very nature and surroundings, become matters of public interest.

Our gleanings for the present issue show:—

Oakland, 22 frame buildings	$61,200	
" 2 alterations	4 700	—$65,900
E. Oakland, 18 frame build'gs,	$43,700	
" 2 alterations	10.500	— 54,200
Alameda, 7 frame buildings	$18,500	
Berkeley, 4 " "	7,400	
N. Berkeley, Berryman tract 2 frame buildings	5,400	— 31,300
Total reported from the Oakland side of the bay		$151,400

(See Building Intelligence for itemized report.)

The work of sinking artesian wells in this valley is going on at a lively rate. There are now about forty in the valley, some of which are classed among the best on the continent. Two good augers are kept busy, each employing a force of hands. It is estimated that the average depth of these wells is about 150 feet. Their water is pure, deliciously cool and invigorating.—*San Jacinto Register.*

Don't Fail to Write.

SHOULD this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing him one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

Postal Grievances.

THE discriminations in the postal law of the United States, operating against monthly, bi and tri weeklies, and quarterly journals and publications, and in favor of weekly issues, has long been a source of just and merited complaint. The arguments used in support of this inequality of privileges are not sound nor good, and partake largely of special legislation; as well as an arbitrary ruling by the law-making body as to the status of the publications of the day; for if it were a *fact* that weeklies contain the bulk of all valuable information published, then they, more than any others, should be patronized.

But even were this true, still the discrimination would be unjust, in that it helps and protects one class or denomination of producers, as against others producing exactly the same thing in texture, bulk, and general character, the *time* of production alone being the difference. If the benefits of this special protection accrued to the consumer,—the hundreds of thousands who read the various publications,—there would be greater plausibility in the sophistical argument used; but such is not the case, particularly at the present time, as no publisher would allow the circulation of his publication to suffer on the score of postal charges for delivery, whether requiring one cent per pound, with three to ten copies to each pound, as in the case of weeklies, or one or two cents postage each, as imposed upon all journals other than weeklies. The feeble protests of this journal against so transparant a wrong, began with its earliest issues, and we are glad that other journals, especially the *Art Age*, N. Y., are now moving in the matter, and demanding a fair and equal distribution of rights and privileges in the use of the mail facilities of the United States.

Snows East—Strawberries in California.

COLD weather, frosts, and snows have been reported from various sections of the continent east of the Sierras, in the month of October, making overcoats and warm clothing a necessity to personal comforts. But as these are of common occurrence, even that early in the season, there is nothing special in that state of things,—they being regularly repeated with each returning autumn season, and, therefore, a something to be looked for and expected. But they are strongly in contrast compared with conditions existing upon the Pacific Slope. Although November is upon us, there has not been so much as a nipping frost to harm, much less to destroy, anything that grows. Garden-grown strawberries are in fair supply in our markets; grapes of every variety and species are abundant; pears, apples, some peaches still, and almost every kind of summer vegetables and garden products crowd the stalls, shops, and places where such things are sold. The "rainy-season" period has arrived, and it is likely and hoped that the genial and copious showers will fall upon the earth, until it shall have drank up or absorbed enough to supply moisture during and through the "dry season," to everything that grows; there may also be some few "cold snaps" of short duration, between now and April next, but none of that bitter kind—none that will sink the mercury within less than 30° *above* zero, and when so low as that, it will be severe for California.

Soon, with the falling of the early rains, verdure will everywhere begin to grow, and long before Christmas times come around, the hills and valleys of the Pacific Coast, over thousands of square miles, will be covered with beautiful grass; while in many parts east of the great divide, the frozen earth, with its mantles of snow, and the piercing cold winds, will hold back all growth, until stern winter shall have spent its fury, and the zephyrs of spring bid all nature arise and prepare for the harvest time.

Anti-Chinese Demonstration.

A MASS-MEETING of the people, mainly the working classes, but also considerably of the representative men of San Francisco, was held in Union Hall, on Saturday evening, October 31, 1885. The number present and astir on the occasion was not less than ten thousand, with fully two hundred and fifty thousand others in the city in full sympathy with the movement. While the proceedings were of the most orderly and quiet character there was an intensity of earnestness and interest manifested upon every countenance, but little if any less than that which animated the patriots and soldiers who rushed to the fierce battle fields in defense of the flag of our common country. For this too was a demonstration against an enemy of the worst kind; an insidious and relentless foe, in certain regards much more to be dreaded than the bold and daring men of the South, most of whom, believing their cause to be just, braved the risks and dangers of the battle field and the perils and results of bloody war. But the enemies against whom battle is now waged have entered our cities and garrisoned themselves in our very midst, and so surrounded themselves with the strong bulworks of manufacturing, mechanical, trade, commercial, financial, and other defenses, that unless outgeneraled or circumvented; or by wise, strong, decisive and effectual legislation thwarted, they will complete and make general their monopoly of all the smaller and at present less important branches of industry, precursory to the grand swoop that in due time will be made upon every vital interest of the country. Demonstrations such as that referred to in this article, are both justifiable, and an urgent necessity, not only in San Francisco, but in every part of the United States where white men are required to toil for bread: for it is but a matter of time when, if not effectually checked, Chinese will force themselves into every State, city, town, and hamlet over which the stars and stripes float, with the danger possible that the flag of our Union will be insulted, and that of the hideous dragon raised above it.

A Style in Decadence.

ONE of the strongest claims made in behalf of Queen Anne domestic architecture, which has come to mean anything that throws aside all the rules of symmetry, is that it gives more variety and character to city houses than was possessed by houses of the old style, that stood along the streets like regiments of drilled soldiers. Speaking upon this point a Pittsburgh exchange asserts that it may be questioned whether a hundred houses of the same type, but with a few variations of an extra gable or an overhanging porch, show more individuality than the uniformity of the mansards of a few years ago, or of the Gothic cottages of the last generation. In fact, the most thoroughly characteristic houses that exist in this country today are those of the early part of the century. There may not have been much æsthetic character in the solid, prim, Grecian mansions, of which we still have one or two noted types in our suburbs, but it was a solid and enduring character. Between the rank of some of these old mansions and some of the last vagaries of the architectural craze there is just about the same difference as between the strong individuality of Adams, Webster, and the men of that generation and those of the present day who spend their days in *dilletante* studies of art, or the worshiping of blue china. There are some specimens of the Neo-Renaissance architecture produced in the present era of construction that will always preserve their quaint beauty, but it will not be many years before the spawn of cheap monstrosities that now goes under the name of Queen Anne, will be seen to be as inartistic a conventionalism as any of its predecessors.—*Carpentry and Building.*

The general tone of Eastern journals is against the continuance of Queen Anne as a style of domestic architecture. The Eastern profligacies in peculiar deformities in house building, as compared with the idea of the science of architecture developing strength, symmetry, proportions, durability, etc., has been great. But if the minds that guide the pens that write words of disfavor toward that which they see and know at home, would but journey westward, and tarry a day or two in San Francisco, they would see enough frightful, tortuous, barbarous, hideous transgressions of true architectural skill to set them mad with rage, or make them laugh until aching sides would demand restoratives, or the services of a medical man.

QUEEN ANNE AND EASTLAKE.

The old lady has been tortured some, but poor Eastlake, how he is to be pitied, having been made the scape-goat for ten thousand sins, monstrosities and abuses of taste and architectural decencies, committed by a class of aspirants who would never have been known as practical architects, except by producing all manner of funny things—things outside of all architectural rules and teachings, and calling them "Eastlake." There are hundreds of tons of lumber material cut in fantastic shape and stuck up on the fronts and parts of buildings which, if the avenging angel of architecture should be permitted to pass over San Francisco, would be torn from present lodgments and consigned to the fiery furnace. The cruel sin has been and is, in men incompetent to distinguish between neat and tasty improvements in, and wild, glaring departures from all right rules in architecture, and the impudence with which they concoct impracticable mutilations, and then seek to shield themselves behind the poor man Eastlake, who never wrote a line on architecture with a view of even suggesting a new order or style in house building. And the wrong is still further augmented by the fact that the more pronounced the deformity, and the more unskillful and inexcusable the feature or construction, the more and louder it is called Eastlake, simply throwing enough of Queen's skirts in to relieve the innocent Eastlake a little sometimes.

SOME CLEVER EXAMPLES.

While all this is true, there are some very clever and pretty examples of the "new style,"—a mixture of consistent ideas, carefully handled by some of the better informed and educated architects,—which display good taste and judgment, and give variety and change, and do their authors credit.

Sanitary Cause of Action.

A NOVEL and important case affecting house property owners has just been determined in the Court of Queen's Bench. According to the evidence adduced, a married lady died last year from the effects of blood-poisoning, induced by the sewer gas which escaped into her house at Croydon from a broken pipe. The lady had an income of £1,000 a year, which "died with her," and her husband brought an action against the owner of the house to recover compensation for the loss he had sustained. It was shown that the owner had made "false and fraudulent" representations as to the healthy condition of the house, and the jury awarded the plaintiff £2,228. The judge also ordered the agreement for letting the house to be rescinded. It is said that the fact of the owner being an architect prejudiced the jury somewhat. The sanitary inspector of the district had passed upon the work. This, with an ordinary owner, must have been sufficient defense, but the jury were evidently of opinion that an architect's duty comprised a rigid inspection of every joint in the soil and waste pipes.

Dallas, Texas, claims to be the most striking example of growth in the Southern States. In 1872–73 it was only a clump of unpretentious warehouses and shanties on the Trinity; now it is solidly built over an area extending back two miles from the river, and has a population of over 35,000.

According to a new law in Berlin, which went into effect the 1st of January last, no house can be built higher than the width of the street on which it faces. If such a law existed in Boston some streets would present nothing but a double row of meek and lowly basements.

Magnificent Timber Region.

FEW people have any good idea of the vast timber resources of Tuolumne County, California. Lying on the southern boundary, along the Mariposa line, on the upper waters of the south and middle forks of the Tuolumne River, is one of the finest bodies of timber in the world. Here, for sixty miles, is an unbroken forest of sugar pine, yellow pine, red and white fir and spruce. The trees are enormous in size, and rise to magnificent heights, while the growth is so dense as to plunge the depths of the forests into a perpetual gloom. The trees average from five feet to ten feet in diameter, and their freedom from limbs and knots greatly enhances their value for lumbering purposes. Nothing extraordinary to find pine and fir trees ten and twelve feet in diameter, straight as an arrow, rising to a height of 150 or 200 feet. This body of timber is easy of access, and only requires to be tapped by a railroad to be turned into a vast source of wealth. As yet most of it is the property of the Government. Much of it, however, has been surveyed, and is now in the market. About two years since some parties projected a railroad through this region and prepared to take 50,000 acres of the timber, but apparently the scheme has fallen through. Theirs was not a legitimate enterprise, as their object was only to get the project under way, and then make a big deal with Eastern capitalists. Now the giant trees stand nodding an invitation to the railroad and the saw-mill. Whenever these two agencies make their advent into this immense forest, old Tuolumne will spring into renewed life and prosperity. The field lies fallow waiting for the coming of enterprise and capital.—*Exchange.*

Those who have recently visited the Albert Palace will have noticed the preparations in the Nave for a further novelty. This, we understand, is to be a *gaum*, or village, to practically illustrate the arts and sports, and varied amusements of *gaum* life in India. For this purpose about fifty skilled artisans and entertainers are now on their way to this country. They will practically show us, in workshops as much like their own as skill and experience can make them, the modes in which they carry on their interesting and important industries. There will be wood carvers, metal workers, mat makers, shawl weavers, carpet weavers, rug makers, and workers in many other handicrafts for which India has long been famous, and for many of which she has attained an undisputed pre-eminence; "Nautch Girls" will dance to the weird strains of the native music; "Snake Charmers" will exhibit their marvelous powers over the beautiful but dangerous reptiles of their native jungles; and conjurers, whose skill in "deceiving the eye and bewildering the sense" has long been the wonder of visitors to the far East, will produce, at the Albert Palace, those marvelous feats which have made them famous throughout the world. No doubt many thousands will be anxious to "see how it's done," These interesting visitors will arrive towards the end of the present month.—*Sanitary World, London.*

Mineral Products of the United States.

THE second report on "The Mineral Resources of the United States," by Albert Williams, Jr., Chief of the Division of Mining Statistics and Technology, United States Geological Survey, is now in press, and will be issued shortly. This report is for the calendar years 1883 and 1884, and contains detailed statistics for these periods, and also for preceding years, together with much descriptive and technical matter. The following items relating to building materials are taken from this valuable report:—

Building Stone.—It is estimated that the value of the building stone quarried in 1884 was $19,000,000, as against $20,000,000 in 1883; the decline being due partly to dullness of trade, and partly to the increased use of other structural materials.

Brick and Tile.—The output was about the same as in 1883, but as manufacturers cut down expenses still further, meeting a lower market, the total value is estimated at $30,000,000 against $34,000,000 in 1883.

Lime.—There were 37,000,000 barrels (of 200 pounds) made in 1884, the average value per barrel at the kilns being not over 50 cents, or $18,500,000. The production was about 5,000,000 barrels greater than in 1883, but owing to the fall in price the total value was about $700,000 less.

Cement.—About 100,000 barrels (of 400 pounds) of artificial Portland cement were made, or 10,000 barrels more than in 1883; the total value, at $2.10 per barrel, being $210,000. The production of cement from natural cement rock, was 3,900,000 barrels (of 300 pounds), or 200,000 barrels less than in 1883, worth, at 90 cents per barrel, $3,510,000. The total production of all kinds of cement was about 4,000,000 barrels, valued at $3,720,000.

Marls.—In New Jersey about 875,000 tons, worth $483,500 at the pits, were dug in 1884. In addition small quantities were produced for local use in some of the Southern States. The production is declining, owing to competition with fertilizers made from phosphate rock, etc.

Gypsum.—In the Atlantic States from Maine to Virginia, 65,000 long tons of land plaster and 60,000 tons of stucco, total, 125,000 tons, were made in 1884, of which nearly all was from Nova Scotia gypsum. The statistics from Michigan have not been reported, but the production did not vary greatly from that in 1883, in which year it was 60,082 short tons of land plaster, and 159,100 barrels (of 300 pounds) of stucco. In Ohio 4,217 short tons of land plaster and 20,307 barrels of stucco were produced. There was also a small production in other parts of the country; but the total amount of domestic gypsum used is not known."—*Exchange.*

Science of Architecture.

[Special for this Journal. By F. Hillert, Architect and Mechanical Engineer.]

(Continued.)

ACCORDING to the deportment of the fuel, we have to mention its "combustibility," the temperature required for the beginning of a self-acting oxidation, or the kindling temperature, which is very variable, and is never below 500° C.; its "inflammability" being in proportion to the amount of hydrogen contained in it, its effect or the aggregated quantity of heat, either "absolute," measured according to the weight, or "specific," measured according to the volume, using for a scale the "unit of heat" or caloric, and its "pyrometric" effect or heat, or the temperature of the fire by the perfect combustion, and which is the quotient of the absolute heat expressed in units, and the product of the weights, and the specific heat of the fire gases created, and, lastly, the quantity of air required.

THE FIRE HEARTH IN GENERAL.

Each fire must be so constituted that, by the burning of the fuel, the highest absolute and specific heat possible is obtained; therefore it becomes necessary for the burning to be perfect—all combustible parts are in reality burned; it not only depends on the admission of a sufficient amount of air, but this admission must be so regulated that on intense mixing of the same with the combustible, distilled gases occur; a want of air produces a lower grade of oxidation of the burning parts (hydrogen escapes unconsumed, and the carbonic acid already formed, and in contact with the glowing fuel, is reduced to oxide of carbon); a surplus of air not used is hurtful, by being heated—reducing the temperature in the fireplace. The second condition of a fire hearth is a complete use of the heat produced for heating purposes; and third, the arrangement must be so constructed that, with the admission of air, the discharge of the same, bereft of its oxygen and mixed with the fire gases, is done and conveyed off out of harm's way of men; and in conformity with this consideration, the construction of the fire-place with grating surface, the heating room, ash pit, and the smoke stack must be arranged.

THE FIRE HEARTH, GRATING, AND ASH PIT.

The size of these depends on the amount of fuel to be consumed, the method of heating, and the kind and condition of the fuel. The arrangement must be convenient for working and giving up of the fuel.

The grating surface, which divides the fireplace in the heating room and ash pit, serves to admit and regulate the flow of the atmospheric air; the total grating surface is divided into the free—containing the openings between the grate bars for the passage of the air—and the covered. The proportion between the two—free and covered—varies with the kind of fuel; the size of the total must be ample to take the quantity of fuel to be consumed pro unit of time, which must have a certain height on the grating, and the openings sufficiently large to admit the needed quantity of air.

TABLE FOR AN APPROXIMATE PROPORTION OF THE GRATING:

Kind of Fuel.	100 k g. 204 lb. of fuel pro hour. Total Grating qm. and sq. ft.		Fire Space. cbm. & cu feet.		Ratio of the fire to the total grating.
Coal.	1.4 / 15.06	1.6 sq. m. / 17.21 sq. ft.	0.25 cbm / 8.82 c. ft.	20 cbm / 9.64 c. ft.	1.4 to 1.3
Hardwood & bitum. coal. .	1.2 / 12.91	1.4 / 15.06	0.43 / 14.34	0.50 / 17.60	1-5 to 1-3
Soft wood & peat.	1 / 10.76	1.3 / 13.98	0.65 / 22.89	0.75 / 26.40	1-6 to 1-5
Charcoal and coke.	1.6 / 17.21	1.8 / 19.36	0.53 / 18.66	0.62 / 21.82	1-4 to 1-3

For a high temperature to be obtained in the fire-place, the sides must be lined with a non-conducting material.

The ash pit under the grating, to receive the ashes; the air channel for the passage of air to the fuel must not be low to admit sufficient air, and by a high accumulation of ashes in the pit will heat and burn the grate bars.

THE HEATING ROOM,

In which the action of the created heat is to be made useful, must have a sufficient section, that the fire gases do not obtain too large a velocity, and therefore deliver the produced heat imperfectly. The best and most advantageous cross-section is equal to the free grating surface.

THE SMOKE STACK.

The draft to be produced by the smoke stack is intended, not only to take and convey away the obnoxious and hurtful fire gases after doing the work of heating, but also to furnish the sufficient amount of atmospheric air for a perfect combustion and reduction of the fuel, and must be strong enough to overcome in the same time all the resistances on the hearth—passing of air through the pieces of fuel—and in the flues.

The column of fire gas standing in the smoke stack has, by reason of its high temperature, a smaller density than the atmospheric air, which, resting on top—the mouth—of the chimney, and the pressure at the foot or at the hearth, is larger by a column of air of the same height as the rarified gas column in the smoke stack; the rarified fire gases will raise, and the colder air under the hearth will fill the vacuum formed by the ascending gas, that the excess of pressure between the air and gas column—both of the same height—will furnish dates for formulating an equation to calculate the velocity of the draft in the smoke stack, namely:—

"A family uses for a fire-place one sack of coal, or 100 pounds, weekly, of 8 hours, daily burning, and for each hour 1.3 lbs, creating thereby $\frac{40.14 \text{ for } m=2}{20.93 \text{ for } m=1}$ fire gas of $\frac{1.022}{1.040}$ density requiring $\frac{38.40}{19.20}$ lbs of atmospheric air. But since 1 cu. ft. of air weighs 0.08 lbs, then one cubic foot of fire gas will weigh 0.081, furnishing $\left(\frac{495}{252}\right)$ cubic feet of fire gas hourly of $\frac{1.022}{1.040}$ density."

Assuming that the fire gases in the smoke stack have at least a temperature of 300 degrees, the rarified gas changes its density to 0.65, and its volume to $\frac{777}{403}$ cubic feet per hour, or $\frac{12.95}{6.72}$ cubic feet per second, to be discharged through the mouth of the chimney.

To calculate the velocity of the ascending fire-gas current, the common formula for the discharge of water under pressure can be applied by substituting for the water column of 1 atmospheric pressure, or 33.82 feet air column of the same weight. Air being 770 lighter than water the air column will have a height of 26,041 feet.

$$\text{Velocity} = 8.02\sqrt{(26041+40)-(26040+0.65.40)} = 8.02\sqrt{14} = 30.07 \text{ ft. per second}$$

(wherein the gas column is 40 feet high), requiring an area for $\frac{m=2}{m=1}$ at the top of the chimney of $\frac{0.42}{0.22}$ sq. feet.

The air required for $\frac{m=2}{m=1}$ per second is $\frac{7.92}{4.00}$ cubic feet, which must pass through the free grating.

The velocity of the draft in the chimney only increases with the square root of the chimney. Any fuel, of which the chemical compounds are known, can be utilized as such, and the fire hearth, etc., arranged for a perfect combustion.

Some time since, citizens in the neighborhood of the California Street Railroad Depot litigated with the company, to abate the nuisance created by soot and coal dust thrown on them from the chimney, caused by imperfect combustion. By an order of Court the chimney was extended about fifty feet, and the mouth reduced to more than one-half of its area, which perfected the draft and combustion, and consequently abated the nuisance. The money expended for litigation would have amply paid for a good design. It is this, one of the instances where money and ignorance, assisted by legal chicanery, produced discontent and unhappiness among the very customers on which a rich corporation depended for their existence. Can they not live peaceably together?

Heating of rooms are either periodically—as for halls, churches, etc.—or are continuously, where the heating arrangement must be capable to furnish heat for a longer period of time.

In a room to be heated, the atmospheric air required for combustion is drawn to the fire from the room, to be restored through the untightness of doors, windows, etc. In opposition to this voluntary ventilation ventilating ovens are constructed, which not only supply the room with sufficient air of the same temperature as in the room, but also draw off, regulate, and discharge the unhealthy air produced into the smoke stack.

CENTRAL HEATING.

Central heating, generally speaking, is every heating arrangement, by which many rooms, from a common source of heat, are warmed; but specially, we understand such arrangements, by which the conveying of heat (attached to a suitable medium), from the common source, is distributed to the rooms to be warmed.

The calculation of every heating arrangement is divided in two parts: the first consists in the finding of the quantity of heat required per unit of time, for all the rooms to be warmed; the second, the calculation of the corresponding sizes of the parts of the arrangement for the heating, such as the heat accumulating, distributing, conducting, and delivering, composing the whole arrangement. The first has already been stated; the second part is depending on the system selected, either heating by hot air, warm water, or by steam

HEATING BY HOT AIR.

By heating with hot air, the same is heated outside of the rooms to be warmed, and then conveyed to them. The main parts, therefore, are: an apparatus for the making of the heat, and for heating the air, and the flues conducting the same.

The apparatus for the creation of the heat and for warming of the air, consists of a heating oven (calorifere), and the heating chamber, a room wherein the calorifere is set up.

An oven built for this purpose must fulfill the following conditions, (1) must prevent an overheating of the heating surfaces; (2) must be a so-called "countercurrent" apparatus, wherein the fire gases must have an opposite directed current than the air current; (3) the same must conveniently be cleaned of dust on the outside and of soot on the inside; the cleaning from soot must not require an entry to the heating chamber; (4) the heating surfaces and connecting joints of the different parts must be made smoke tight, and the number of connections must be reduced as much as possible; (5) the expansion and contraction must go on without creating any tension in them; (6) and the utilizing of the radiating heat must be most complete.

The overheating of the surfaces is prevented by a correct proportion of the heat distributing to the heat receiving surfaces, which must be, the larger, the hotter; and smaller, the less warm the heating gases are.

The heat-distributing surface of the heating oven in square meter or square feet, as well as the hourly introduced quantity of air used as the medium for warming the rooms, is calculated by

$$Q = \frac{0.3.\,L\,(t-t_w)}{W}$$

$$L = \frac{M}{0.3.\,(t-t_i)}$$

Wherein Q is the heat-distributing surface of the heating oven in square meter; L, the quantity of air in cubic meter used hourly as medium for heat introducing, respectively, heat leading off; M, the quantity of heat per hour used up, and to be replaced by heating; W is the mean heat delivery per hour per square meter surface of the heating oven on the surrounding atmospheric air; t, the temperature of the air to be introduced into the rooms to be heated; t_i the temperature of the air to be discharged from the rooms; t_w the lowest temperature of the outside air, by which a good warming of the rooms is to be effected.

The mean heat delivery of the heating oven must not be taken below 1,800 C. and not over 2,500. The temperature, t, up to which the air is to be heated by the heating oven, respectively, the heat for the entry into the room to be heated is, on the highest, 50°.

From the above formula can be seen the important fact, not sufficiently appreciated in *praxis*, that to supply the needed transmission heat for a constant temperature, t, the quantity of air, L, cannot be selected arbitrarily; t_i is for all the rooms to be heated from the same air-heating oven, constantly.

The shape of the heating oven is very variable. The material lately used, in addition with brick and fire brick, is exclusively cast iron, seldom wrought iron.

Flues for conducting the air are, (a) flues for conducting the cold, fresh air from the outside to the heating oven; (b) flues for conducting the heated air to the rooms to be heated; (c) flues for discharging the cooled, spoiled air to the outside (ventilating flues); (d) flues for conducting the used air to the oven for the purpose of reheating (circulating flues).

The use of the flues at 1 is only conditionally recommended, expressly for the starting of the heating operation.

The section of the flues (F) is calculated in consideration of the quantity of air to be conveyed, and the assumed velocity of the same. The velocity, theoretically calculated, is never obtained in reality, the same being reduced by various resistances. If we have not to contend with extraordinary proportions (long, horizontal, and slightly inclined flues, etc.), when for them a correct calculation, under consideration of all the separate, single resistances, must be made, the following formulas for practical use can be applied:—

$$F = \frac{L}{3{,}600}\left\{\begin{matrix} v \\ v_1 \end{matrix}\right\}; \quad v = 0.5\sqrt{\frac{2gH(T-t}{273+t}}; \quad v_1\,0.5\sqrt{\frac{2gH(T-t)}{273+T}}$$

Wherein T represents the section of the flue in square meter; L, the quantity of air for each hour in cubic meter passing through the flue; v, the velocity of discharging of air into the colder air; v_1, the velocity of air discharging into the warmer air; 2g=19.62; H, the height of the flues in meter. Difference of temperature between the lower and upper end; T, the temperature of the warm air; t, the same for cold air.

The execution of the flues must be very carefully done; the brick work must be made as smooth as possible with smooth joints. Where it is possible, on account of the small size of the walls, glazed clay pipes can be used.

Flues for the conducting of hot air, and those for carrying off the spoiled air, must not (except circulating pipes) lay in the outside walls; they must run up perpendicular; all changes of direction and of section must be avoided.

There, where from the heating chambers, perpendicular or inclined flues, and flues running to different distances, are to be branched off, it must be recommended, besides the regulating arrangements to be put in the walls of the rooms to be heated, to put in a regulating slide valve at the foot of the flue, and the same, later, during the heating, to be closed; that all flues in a uniform manner fulfill their functions as desired, the sections of the flues should be nearly square or circular.

The outlet in the hot-air conductor for the common rooms should be 2–2.25 meter (6.56–7.38 feet); for high halls 3–4 meter (9.84–13.12 feet) above the floor. In very large rooms, where a uniform distribution of the hot air is desired and a powerful ventilation arrangement exists, the discharge openings of a larger number are put in the floor.

The discharge of the air from the room is done by the circulating heating flues and by heating with ventilating arrangement in winter time close to the floor, and by summer ventilation, or when the air is warm or spoiled by gaslight, close to the ceiling. For the selection of the position of the hot air and the ventilating flues, we observe that the hot air on entering the room ascends towards the ceiling, spreads over the same and towards the windows and the cool walls, where the same cools off, becomes denser, sinks, and in spreading over the floor moves towards the discharge opening in the wall above the floor.

The admission flues for fresh air, and the entry for the same, are placed in a sheltered position. Best to use two openings placed in opposite directions in the building, of which the one is to be used laying opposite to the direction of the wind. The sections of the openings must be such that the air will enter with not a higher velocity than 1.5 meter (4.92 feet) per second. It is of advantage to arrange a large air chamber close to and behind the entry for the settlement of the dust, etc., contained in the air, but which may be accomplished by application of a wire-screen filterer.

The size of the openings for entry and discharge in the room to be heated are regulated by the velocity of the air, and is from 0.5 to 1 meter (1.64–3.28 feet). The openings of all the flues must have good-fitting regulating arrangements. It is of importance that the flues are easy of access to be cleaned.

The building statistics of Washington, D. C., show that an unusually large number of buildings were erected during the past year. According to the figures, 1,330 dwellings and 303 buildings for other purposes were added to the city and the property valuation increased by $3,564,611.

Mechanical Aids to Decoration.

BY A. CURTIS BOND.

MECHANISM in decoration, by which color designs and forms may be indefinitely repeated or multiplied, is always in course of progress; yet it here would seem, with all the varieties of adaptations which we witness, certain defined limits, and in numberless directions of decorative art handiwork well asserts its superiority. Yet mechanical production itself bears the stamp of intelligent purpose and constructive ingenuity, it being, so to speak, a transfer of handwork, an intermediary between the designing brain and hand, shown in the pattern and the execution. The die of the mould for molten metal and plastic material has either itself to be worked out by hand, or, if obtained by impress of relief work, the relief model has to be carved. The production and duplication of much decorative work by mechanical means is recommended by economy, in some instances by greater uniformity, but in the higher spheres of decoration, the absolute uniformity thus obtained falls far short in value of the direct work of the hand. This is evident in ornamenting in color, walls and ceilings, if the execution be skillful, as compared with stenciling. The slight variations in the ornament—for the work of the hand never absolutely repeats itself—is itself a charm, as showing greater freedom of execution, and in some instances greater delicacy of touch. Nevertheless decoration is greatly behooven to the mechanical arts for its diffusion, whether in furniture, structural surfaces, or the ornaments by which interiors are adorned.

One of the greatest novelties promised in mechanical devices, as concerns painting, is a machine consisting of a hand piece, a compressed air chamber, and an air pump, with communicating cup filled with liquid pigment, the latter filled with liquid pigment, which enables the artist to throw out a spray which, in the first instance, forms a fine line, and in the second, widens the line to the desired breadth. The skill required in the operation, the proportions to be given to the line, renders the line, which may even be thus shaded at will, something more than mechanical work.

Many devices for facilitating decorative work may be characterized as assistive. They are brought in co-operatively, and are little more than the brush to the painter. The improvement in tools merits notice here. Take, for instance, the wedge-shaped brush so useful for many purposes, previously to the manufacture of which decorative artisans had to wait the wearing down on one side of their flat brushes. Fortunes have been made by smaller devices than these, suggested primarily by individual requirements and really foreshadowed by the efforts of artificers in their practices or methods, to devise means for escaping inconveniences attached to their tools. The tools used for wood carving, and adapted to special purposes and to different scales, have been greatly increased in number of late years. There are mechanical devices which may be regarded as completing the operations of the hand, as when, previously to applying veneer, the ornament adjusted to the pattern and already rubbed down with the veneering hammer, and affixed by glue to paper, is placed between hot boards and pressed with hand screws, which, when the glue is dry, allows the work to come out quite clear from the boards and appear as one piece of veneer, which is then ready for application.

The cowl with its screw clamps comes to the aid of the veneerer to secure a graduated pressure, commencing from the center of the pieces, being an exact counterpart of curved work, and when flat employed, like the veneering hammer, for plain surfaces. The heat of the cowl quickly penetrates the thin veneer, making the glue exceedingly fluid, and the pressure applied by the clamps soon expels the greater portion of it, and causes the veneer to bed very closely to the work.

Wood carvers, in copying models, are now supplied with a marking or cutting gauge of ingenious construction by which, when once set to the required dimensions, they cannot only give all their markings the relative width, but secure depth of the ground line of the carving, and height of relief portion, or rather the excess on their own panel, so as to enable them to cut away freely, instead of timorously dealing their strokes.

The services of the lathe are particularly prominent in decorative woodwork, particularly in hand-turning. In hand-turning the tool is held by the hand, the changes of form made in the wood being dependent on the relative position or angle of the cutting edge. It is the work of an instant only to vary the relative height and angle of a hand tool to the work, converting it from a roughing to a finishing tool, or even to a scraper, which operations are often impracticable with a tool held in a side rest. With the latter the guidance is solely by the eye; with the lathe the delicate sense of feeling is appealed to, so that any variations may be made with absolute accuracy.

In the development of electricity as a motor under the system of storage, much of the preparatory work of the moulder, whether in wood or metals, will doubtless be greatly aided in the future.

Scaffold brackets is among ingenious contributions to the satisfactory execution of exterior house decorative work on walls. This work is necessarily done much better when the artisan has not to balance himself, but obtains a steady platform without unpleasant swaying. The ladder is made with large hooks at top to hang from window sills, and the platform which is transferable to any of the runs, is fastened by curved hooks attached to an environing bar both to that rung and the rung above.

Album of Mantels ..... **$ 8.00**

More Lost Arts than Fresh Discoveries.

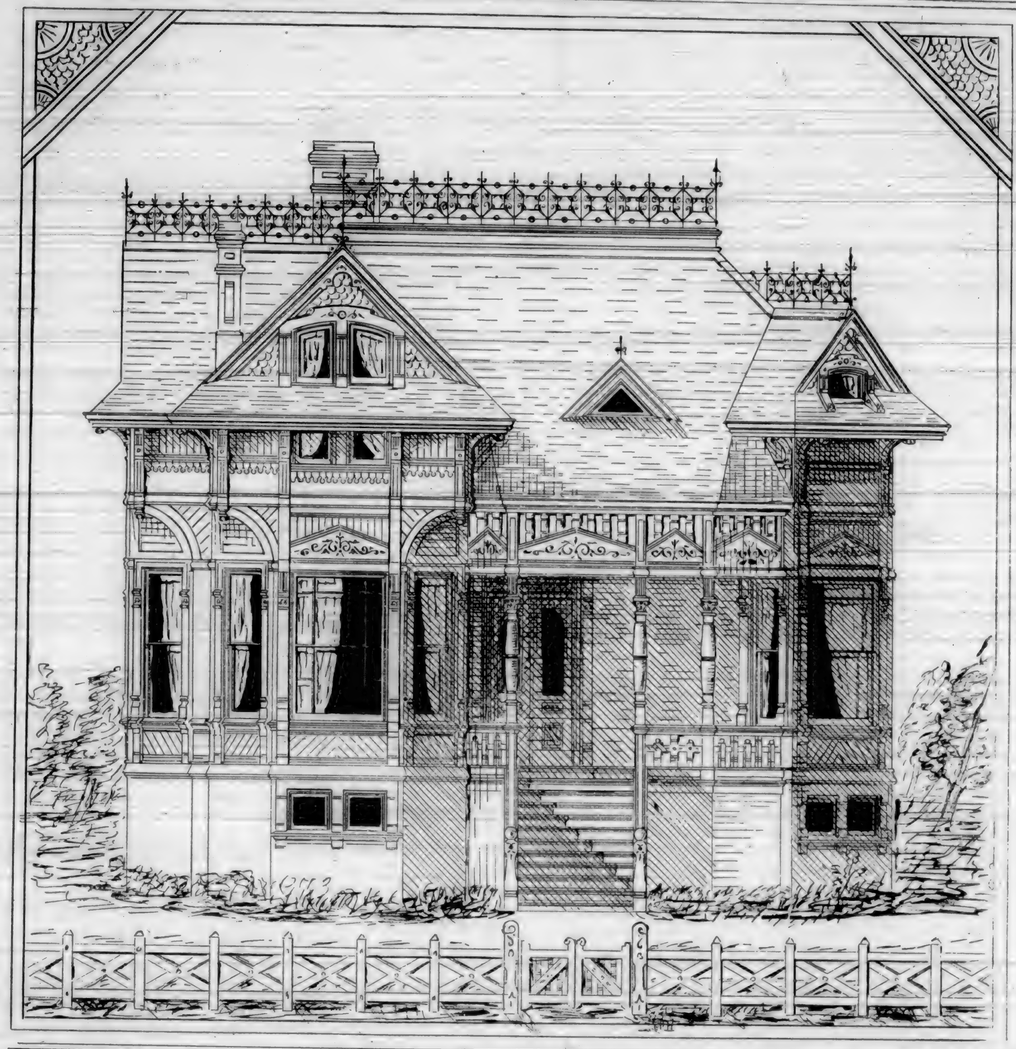
THOSE evolutionists, says the New York *Journal of Commerce*, who believe that our ancestors were fools or pigmies, will find little comfort in the fact that between the ancients and ourselves there are more lost arts than fresh discoveries. Modern chemistry has exhausted itself in the vain effort to produce a compound as useful and durable as the cement of olden times. Vitruvius, who wrote upon architecture before Christ, but whose works have only been printed within the last 450 years, speaks of *opus albarium* and *opus coronarium*, as well-known compounds, too familiar to need description. Among modern experiments are the oil cement of Adams, made of fine whiting and calcined oyster shells ground up in a mill with oil; Pashu's, called Roman cement, is made of argillaceous limestone. Bailey's cement is composed mostly of lime and sharp sand. Mastic cement (sometimes called Hamelin's) is composed of peroxide of lead and oil. The technical "stucco" is made largely of plaster of Paris and lime, and is used for interiors. The Italian stucco is chiefly lime putty, mixed with white sand or powdered marble. We presume the ancient stucco so durable was made of a peculiar sand, or of powdered marble, since the great fault of modern outside work is in the impurity of this foundation. If sand is used, it should be repeatedly washed until it will no longer discolor the purest water. The least particle of earthy matter will be brought into action in warm weather and spoil the adhesion. The wall should be oiled before the stucco is applied, and the latter should be thoroughly oiled every two or three years afterward. But our ancestors, according to the evolutionists nearer the apes than ourselves, could prepare the cement and color it after the fashion that mocks all the modern attempts at either.

Licorice Cultivation.

WHAT is there in the entire vegetable kingdom that California cannot produce? There is scarcely anything that is grown in the earth that does not find favorable soil and climate somewhere within her borders.

The cultivation of the licorice root, is one of the most recent industries of our State, and promises to be not only a successful but a very remunerative one. The experiment has been successfully tried in Sacramento County, where it is estimated that the net receipts from one acre, at thirteen cents per pound, would amount to $2,400 from the first three years' growth. No doubt other parts of the State would be equally favorable to its growth.—*The Interior.*

It is estimated that the value of the building stone quarried in 1884 was $19,000,000 as against $20,000,000 in 1883; the decline being partly due to dullness of trade and partly to the increased use of other structural materials. —*Age of Steel.*



The American Institute of Architects held its annual Convention at Nashville, in October. The number present was not large—not such a representation as should have been, considering the number of practicing architects in the United States. But this fact is not to be considered as evidence of non-interest on the part of the membership, but as proof that architects generally, all over the country, are so engaged in the conduct of their business that it is inconvenient, if not practically impossible for them to leave their offices and business even for a week. As far as the "Fellows" of the Institute residing in San Francisco are concerned, every one of them would gladly have been present, but time and circumstances forbade that pleasure. But the session is reported to have been one of the most delightful character, and those who did attend were richly repaid for the loss of time and expenditures attending. The most liberal and kind courtesies were extended to the attending members in all directions; so that, aside from the fraternal pleasures and benefits of the occasion, there was a season of enjoyment which will long be remembered by those who made the sacrifice and were present at the Convention of 1885.

Ten years ago a standard car load on all first-class railroads was 20,000 pounds, the weight of the cars being about 20,500 pounds In 1881 the load on most roads had increased to 40,000 pounds, but the weight of the car had increased to only 22,000 pounds. The master car builders of the Pennsylvania road have now adopted cars to carry 60,000 pounds; while the weight of the cars will be very little increased. Instead of hauling more than one pound of car to one pound of freight, nearly three pounds of freight can now be hauled for one pound of car. The substitution of steel for iron rails has made the change possible.

Arrest of Architects.

MESSRS. WRIGHT & SANDERS, architects of the Union Club Building, northwest corner of Post and Stockton Streets, were arrested, a short time since, for violation of the Conglomerated Code of City Ordinances, denominated "*Order defining the fire limits, and regulating the construction of buildings in the city and county of San Francisco,*" in which is contained all matters specially and properly belonging to the supervision of the fire wardens, chief engineer of the fire department, and his assistants, and also all matters which should be under the separate control and direction of a competent "building board," "board of public work," or a qualified board called by any other name. Without discussing the merits of the Code as now in force, the facts of the case in question are these: The wrought iron, or box girders to be used in the erection of said building, were specified in harmony with the requirements of the law regulating how the girders should be made. The competition was submitted to the wrought iron workers in San Francisco, and the award of contract made to the lowest bidder, who happened to be the agents of an Eastern manufacturer. This created an interest on the part of the San Francisco manufacturers in the character of work that would be produced under the contract.

The girders finally arrived, and, while the material and workmanship employed in their construction was beyond criticism, they were not constructed as the law provides, which reads: "*Wrought iron girders, if made of plate iron and of box pattern, shall have proper diaphragms placed in them at distances not exceeding five feet apart, and the riveting shall be done hot, and hammered to a proper conical head.*" No question was raised as to the sufficiency or strength of the girders, nor the quality of material or workmanship; but the diaphragms were spaced a greater distance apart than five feet, and the rivets were round, button, or cupped heads, instead of "proper conical heads." The matter was freely talked over among interested parties, and it was understood that arrest would follow the attempt to place the girders in position in the building; consequently, when they were lifted and seated on the walls, an arrest complaint was served on the architects, and a prohibitory injunction issued, stopping the work.

Although two weeks or more have passed since the arrest, at the time of this writing, no decision has been rendered, and the case still hangs before the Police Judge, under the charge of violating a city ordinance.

The violation is clearly technical, as it is not likely that the framer of the ordinance ever contemplated or intended any more than that all such girders should be properly made, and sufficiently strong for the purposes intended. But the law is arbitrary in its language, and should be either held as the absolute rule of practice, or be wiped from the ordinance book. There is no discretionary power anywhere to regulate matters of this kind; to allow, as in this case, the use of something else every whit as good as that required by the law, to be used. But if local manufacturers are held strictly to the law, even in the matter of conical head rivets "done hot," and diaphragms spaced five feet, then outsiders should be held to the same rule.

THE FIRST RAILROAD IN AMERICA.—In the course of a paper read before the Franklin Institute, bearing the title "Transportation Facilities of the Past and Present," Mr. Barnet Le Van corrects the commonly received statement that the Granite Railroad, built at Quincy, Mass., in 1827, by Gridley Bryant, for transporting stone for the Bunker Hill Monument from the granite quarries of Quincy, was the first railroad built in the United States. On this point he presents interesting testimony to prove that, far from being the first, the Granite Railroad was really only the fourth in order of precedence in the United States. We quote from that portion of the paper relating to the subject, with the simple comment that the statements made by the author are of considerable importance from the standpoint of historic accuracy: "Railroads were also first introduced in Pennsylvania. In September, 1809, the first experimental track in the United States was laid out by John Thompson (the father of John Edgar Thompson, who was afterwards the president of the Pennsylvania Railroad Company), civil engineer, of Delaware County, Pa., and constructed under his direction, by Somerville, a Scotch millwright for Thomas Leiper, of Philadelphia. It was sixty yards (one hundred and eighty feet) in length, and graded one and one-half inches to the yard. The gauge was four feet and the sleepers eight feet apart. The experiment with a loaded car was so successful that Leiper in the same year caused the first practical railroad in the United States to be constructed for the transportation of stone from his quarries on Crum Creek to his landing on Ridley Creek, in Delaware County, Pa., a distance of about one mile. It continued in use for nineteen years. Some of the original foundations, consisting of rock in which holes were drilled, and afterward plugged with wood to receive the spikes for holding the sleepers in place, may be seen to this day."—*Exchange.*

There are twenty window glass factories in Pittsburg, with 276 pots, making 838,400 boxes, at $3.00 per box. The glass trade is fairly active in all branches. Flint glass works are everywhere running to their full capacity.

Most of the private structures in Russia are built of wood, and it is estimated that the bulk of them burn down every seven or eight years. There is said to be always twenty fires, at least, in different parts of the empire.

Cumming's Details..... **$6.00**

Side-Walk Ordinances.

MR. FARWELL of the present Board of Supervisors has for several months seemed to have had "side-walks on the brain." Consequently he has proposed and introduced several orders, more than one of which has been passed by a majority vote of the Board and gone to the mayor for an expression of his opinion, with the result—veto every time; and as often the veto has been sustained; except that the last passed by the Board in October, and vetoed by the mayor, was finally passed by a vote of ten to two over the veto.

The issues and merits of the case may be thus stated: That the first side-walks laid in San Francisco were of wood, that being the only available material in the early days of the city's existence for the purpose. For several years there were no other than wooden side-walks in use, except occasional isolated cases of brick construction. But the brick obtainable, failed to serve a good purpose, owing to unequal hardness and durability—the softer wearing away more rapidly, leaving as many pot holes in a side-walk of five hundred square feet as there are small-pox pits in the face of a man who has passed through a bad case of that disease. The late Mr. Lick of Lick Observatory renown, went further, and obtained pressed brick, such as those used in the facings of buildings, but they proved to be no more durable than the common article, and brick side-walks were passed as impractical. Time and service proved that side-walks of wood construction were also but temporary expediencies, as the friction and wear and tear on the surface wore away the fibers of the wood rapidly, causing unevenness, and where knotty pieces were used, the softer parts would wear away around the knots, leaving disagreeable lumps for people to stumble over and sometimes sprain an ankle. Beside this, the sleepers and underside of the planking would soon rot, thereby destroying the hold of the spikes used in securing the planking, and, as a consequence, the spikes would work their way upward, and protrude above the planking, thus forming a rake-like surface for pedestrians to practice toe stumping, and ladies to hook the lower parts of their garments and tear them; and thousands of devout female worshipers have gone to the house of prayer full of indignation at the annoyance of having torn their skirts by catching them on a nail in the side-walk, or, perhaps, the sudden jerk carrying away the pin and string fastenings at the waist and letting more of the under-clothing drop in the street than was agreeable to a lady. During the past ten or fifteen years, however, greater care has been exercised in laying plank side-walks; the surface of the planking more generally being surfaced, larger timbers being used for the sleepers, and the spikes being set in with nail sets. The next to appear for public approval was the

ASPHALTUM SIDE-WALKS,

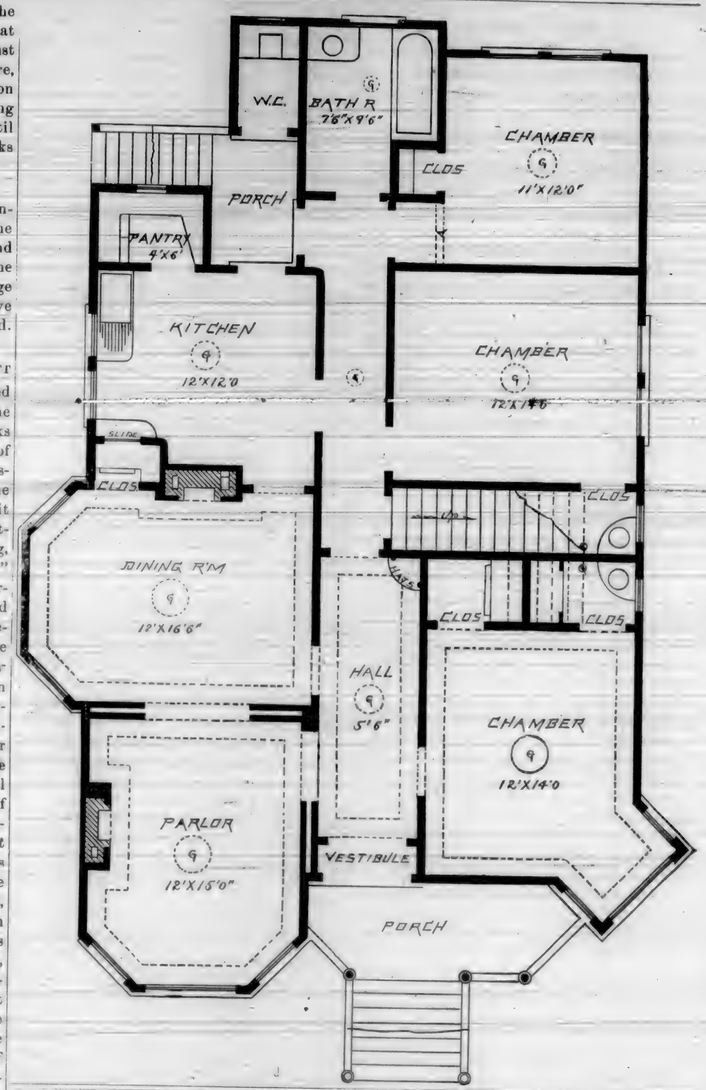
And tens of thousands of feet were laid, both in the business localities and residence quarters. These gave great satisfaction over the wooden constructions; but time proved that even the asphaltum material failed to be just the thing, as exposure to the atmosphere, evaporation, and ordinary wear and tear soon developed defects, such as softening during warm days, cracking, disintegration, etc., until at the present time but few asphalt side-walks are laid. The next in order was the

PATENT STONE OR CONCRETE SIDE-WALK,

Which, during the past ten years, has maintained great popularity, and stands to-day the most appreciated of side-walk materials; and is generally adopted by all who can afford the difference in cost over wood. A very large number of the wooden constructions have been torn up, and the patent stone substituted. The conflict between

SUPERVISOR FARWELL AND MAYOR BARTLETT

Is, the supervisor has aimed and introduced municipal legislation, to hereafter inhibit the construction of any more wooden side-walks within certain limits, and to compel the use of "natural stone, artificial stone, flagging, asphaltum, concrete, or bituminous rock." The mayor on the other hand, seems to think it possible with such a law in force, for importers and dealers in cement, asphaltum, flagging, etc., to "put up a job," and "make a corner" in the materials contemplated by Mr. Farwell's order, and so force property owners and the city to pay exorbitant prices for side-walk work. He further argues in favor of the lumber trade, claiming that there is no present prospect for another lumber combination such as has heretofore at times ruled the lumber market and shoved the price of rough lumber, which is now selling at fifteen dollars per thousand feet, up to twenty-five dollars. The public should be satisfied with the careful forethought of his excellency in the matter of guarding the common interests against the exactions of greedy and soulless monopolies, but the quality, sanitary and pleasurable features of the case seem to be ignored; that the more durable side-walks, as compared with wood, are far more protective of health, and much more agreeable to travel over. The innuendoes of "a cat in the meal bag" is freely hinted, and may exist, but this is a speculative presumption without proof; still it is a fact that the Patent stone is the only one of those named as allowable, likely to be used, and the whole matter simmers down to the question of a *corner in cement*, to prove the mayor's position correct. Owners *can* use either of several other kinds of side-walk, but nobody wants them, and entering them in the list of usables, is an appearance without substance.



Revival of Trade.

PREDICTIONS are freely made that the coming fall and winter months will witness a substantial revival of trade. Indications of this nature are observed almost daily, in all parts of the country, and are eagerly recorded by the newspapers, the public hunger for that sort of information having been sharpened by months and years of enforced abstinence. The history of mercantile and manufacturing business in this country presents a series of reactions, and the pendulum is thought to have swung in this case as far in the direction of low prices and stagnant trade as it can go. Manifestly, therefore, any change that is in store for us is likely to be for the better. But we think it improbable, and not only improbable but undesirable, that any new "boom" of the 1880 pattern will be experienced in the near future. If there should be a gradual and healthy recovery in our industries, chiefly distinguished by the absence of reckless speculation and intemperate railroad-building, it would be sufficient cause for thankfulness; and for such a change we may indulge a confident hope.

Boston has more apartment houses than any other two cities in the country, New York excepted, and of the most of them it may be said that if the evil one himself had been consulted they could not have been arranged with less regard for the health and comfort of the occupants.—*Boston Post.*

How to Decorate.

ODD pieces of furniture are still used more extensively than matched sets, and for a parlor we would suggest the following pieces: A couple of easy chairs, and occasional chairs, a divan, cabinet, fancy table, and a mantel mirror, with side shelves for the bric-a-brac.

When dining-room furniture is of oak, golden brown draperies and upholstery are very handsome and appropriate.

A library should be made as home like and pleasant as possible. Old pieces of pottery or china, metal work, ivories, glass and such other objects of art manufacture display good taste.

Brass decorations are used very extensively for bedrooms, iron and other metals for hall and vestibule.

No modern house is complete without a Louis Seize room, and the following suggestions will produce the effect desired: The woodwork is painted in a cream tint and a detail picked out in gold; the walls are draped with blue satin and the frieze has light garlands in relief, and small medallions in gold on ivory ground; add a few spindle legged pieces of furniture in gold with pale-tinted satins or light garlanded stuff, and some Dresden china bric-a-brac.

In furnishing bedrooms everything should convey a cool and pleasant appearance; the floors covered with fancy matting which may now be procured in the most beautiful designs and soft colorings; the draperies should be light and airy; if you have a canopy bed, cream white Madras will look remarkably well lined with pale blue silesia; for the bedspread, pillow-shams, bureau trimmings, and drapery for top and side of canopy, trim with lace or the pretty tassel fringe which comes for the purpose.

Sideboards of either massive oak, extensively carved, or hand-carved mahogany are very pretty and desirable for our dining-rooms.

Leather leads itself in so many ways to easy decoration that cabinets and other articles of furniture are covered with it.—*American Inventor.*

SOME COMICAL BUT COSTLY BLUNDERS.—Mistakes are expensive sometimes. A New Yorker had a lot seventy-five feet wide, intending to build four houses of equal fronts on it, and one of the middle ones first. He employed a firm of surveyors to locate the house, and they located it so that the remaining space on one side was only ten feet wide. The error was not discovered until the house was done, the proprietor having no time, probably, for such trifles. Then he sued the surveyors for damages, but they won a verdict on the ground that their plan was accepted and paid for as satisfactory, although it located the corner-stone nine feet farther in one direction than was intended. This mistake was rather more serious than that played upon a resident in a brown-stone front in Forty-seventh Street, who returned from business one night to find the entire stoop of his house in ruins, the heavy stonework having been pulled to the ground. His wife said a man had come with orders to demolish, and had done so. Although she did not know enough to command a halt for explanation, she did observe the name on the wagons. The indignant citizen took measures to prosecute, when it was found that the employer of the men had ordered them to go to the same number in Forty-eighth Street, instead of to Forty-seventh. He had learned of the mistake and had contracted to have the wrong stoop rebuilt, and he was surprised to learn that the work had not been done. These incidents of metropolitan life show that mistakes are there regarded with very little concern, those responsible not even taking the trouble to apologize or even explain. The same amount of pains spent in doing a job well that is spent in getting the job to do would pay.—*Springfield Republican.*

The Better Bridges.

A VERY pretty fight is in progress in Japan over the question of American *vs.* English bridges. Early in the year Prof. J. A. Waddell, of the University of Tokio, published an elaborate work in two volumes, for the purpose of pointing out to the civil and mechanical engineers of Japan the superiority of American to English types of bridges, and the mistake of the Japanese in following the practice of the latter. On account of defects, which the author points out in detail, the author concludes that "the trouble with English bridges, and consequently with those of this country (Japan), is that they are designed by railroad engineers, who have not made a special study of bridge designing, and are therefore incompetent to do the work intrusted to them." On the other hand the author points out in detail his reasons for the assertion: "That the United States leads the world in bridge building is a fact undisputed even in Europe." Professor Waddell's book set several bridge engineers to writing letters to the Japan *Mail*, in which the statement that American engineers now lead the world in designing bridge work is called in question. Professor Waddell replies in a very pungent letter, and, taking up his opponent's arguments, answers them in detail. He remarks that actual inspection of English bridge work in Japan shows a quality of workmanship that is even worse than the cheapest highway bridges of America. One case mentioned, a railway bridge, has its bottom cords so warped that "the floor beams bear on both sides of the same;" shims of ⅛ and ¼-inch iron are freely used, and there are open joints in the top cord that paint will not hide.—*Age of Steel.*

So rapid is the transmission of the electric current along the lines of the telegraph wire that, supposing it were possible to carry the wires eight times around the earth, it would occupy but one second of time.—*Doidge's Annual.*

An English Plan of Ventilation.

THE following description of Dr. Hogg's plan of ventilating and warming dwellings is taken from an account in the London *Lancet*. It is one of those which are more ingenious than practical, and just complicated enough to please the English: "According to this, none of the windows are to be opened; and there is but one fire-place, — that in the kitchen. Underneath the hall a large passage is used as the intake of fresh air, where it can be cooled in summer by ice or water-spray; while in winter it is warmed by hot steam pipes, economically heated by a small coke stove. The air then passes up into the hall, from which it is separated only by an iron trellis-work, and travels into every room of the house by apertures made in the skirtings and cornices. In the ceiling of each room there are one or two openings, and exhaust shafts leading to the foul-air chamber in the roof of the house, the exhaust suction being produced by a large shaft, which runs from the foul-air chamber down to the back of the kitchen fire, where the heat of the boiler and the fire suffice to attract the air. From the back of the kitchen fire, in the basement of the house, the air again travels up, a square brick shaft or chimney conveying it through the roof and into the open. In the center of this shaft is a circular metallic flue, which carries away the smoke of the kitchen fire; and this flue, always more or less heated, stimulates the current of air."—*Sanitary News.*

A Rapidly Growing Health Evil.

IT is not generally known that coal oil and gasoline stoves rapidly vitiate the air of a room for breathing purposes by the development of large quantities of carbonic dioxide. How much longer must this continue before manufacturers of such goods will obviate this new danger by inventing some form of hood and pipe for conveying this poisonous gas to the outside atmosphere? Volumes have been written concerning the ventilation of homes, and the injury that arises, especially to children and the infirm, from crowding too many people together in closed apartments, and now, with the introduction of oil and gasoline stoves in the household, a new difficulty presents itself which is not easily remedied in the endeavor to provide for health and comfort. These stoves are frequently found with several large burners in full blast, in small kitchens hardly large enough to contain air to supply the healthful requirements of one person.

Evils of this kind, where they are widely spread, must have a terrible effect upon the strength of a population who breathe every day such an atmosphere, and, thus far, we have seen no remedy. It is certainly a question for grave consideration, and whoever takes the problem in hand at once, and provides a means, at low cost, to obviate this nuisance, will confer a great blessing upon thousands who are innocently undermining their health. —*American Inventor.*

The bustling, hurrying man, as a matter of fact, is a poor worker. Too much of his steam power is expended in kicking up the dust. The habit of hurrying and being in a hurry, is fatal to good work, and diminishes the amount of work a good man can do. The men who accomplish most never seem in a hurry, no matter how much they have to do. They are not troubled for lack of time, for they make the most of the minutes by working in a methodical manner, finishing each job properly, and not expending their nerve force in bustle.—*Exchange.*

The value of well-conducted trade journals to the interest they represent, is becoming more apparent every day. They are the best possible means of communication between members of the trade, and for that reason no business man can afford to ignore them. The live manufacturer or jobber desires to keep his name constantly before the trade, and in no better way can he do it than through an advertisement in this trade Journal.

BOOK NOTICES.

Principles of Economy in the Design of Metallic Bridges. By C. B. Bender; Wiley & Sons, N. Y., publishers. A new book of 195 pages, 6x10 inches, with elaborate and comprehensive plates and diagrams additional. The subject matter is handled with ability and thoroughness.

Steam Engine Catechism, 1885. By Robert Grimshaw, President James Watts Association, received. A handy little work of 149 pages, on matters suggested by its title—engines, and steam in its ten thousand applications as a motive power. It will be found useful to young engineers, interesting to older heads, and convenient for examination boards. Price, $1.00.

The Principles of House Drainage is the title of a well-written book of 125 pages, 5x8 inches, comprising the substance of three lectures delivered by J. Pickering Putnam, before the Suffolk District Medical Society, and the Boston Society of Architects, at the Massachusetts Institute of Technology. Traps, Siphonage, Ventilation, Evaporation, Wastes, Drains, and the material features involved in sanitary science, are all handled and discussed in clear and intelligent language. Published by Ticknor & Co., and for sale at office of this Journal.

Architectural Studies.—Store Fronts and Interior Details, edited by F. A. Wright, architect, and published by W. T. Comstock, New York. *Sent by mail to any part of the world free of postage.* Price, $1.00 each part or number. Part No. 2 contains twelve neatly produced plates, with numerous scale details.

Sanitary House Inspection. "Hints and helps regarding the choice of a healthy home in city or country." By William Paul Gerhard, C. E. Published by Wiley & Sons, New York. Contains 145 pages of thoughtfully considered and well-written matter, which should be read by all interested in the subjects treated.

All books noticed, or any other published in the English, or any other language, can be had at publisher's prices through the book department of this Journal. A large variety of Architectural, Mechanical, Sanitary, and similar works constantly on hand.

This Journal Sent Free of Cost

TO ANY one forwarding to this office the names of *four* others, beside their own, and the amount of *four* annual subscriptions,—$8.00.

Amateur Carpenters.

IT is an excellent thing for any man, whatever his business in life may be, to acquire a fair degree of mechanical skill and familiarity with tools and machinery. Such knowledge never comes amiss, even if its possessor is so fortunate as to be under no necessity of ever using it as a means of livelihood; just as a thorough practical acquaintance with the minutest details of housekeeping is valuable to any woman, though she may be surrounded by luxury all her life and have a servant to wait on her at every turn.

But it does not follow, by any manner of means, that an amateur or half-trained workman is profitable to his employer, even at half price, or at any price. Experiments of that kind are oftener made, it would seem, in the various branches of carpenter work than in most other trades—for the reason, probably, that it is easier and more common to pick up in a desultory way a superficial knowledge of carpentry than of other callings which do not in fact require so much skill and judgment for their thorough mastery. To become a good carpenter, capable of estimating a job fairly and performing it honestly, is a matter not of a few weeks or months, but of years of diligent and conscientious work. And while the temptation is very great, in awarding the contract for a job, to give it to the lowest bidder without due regard to the probability of getting the worth of one's money, it is generally found that a single lesson of that kind is sufficient. In a broad sense the rule that "the best is the cheapest" holds good in carpenter work as in nearly everything else.

A vigorous protest against the employment of what it calls "saw and hatchet carpenters," is made by the *Southern Lumberman*, which imputes to them not only want of skill but want of honesty as well. As an illustration, it mentions a building contract which one of that class of carpenters offer to take for $500, while the material alone came to $570. Somebody was badly cheated, of course, and probably the lumber-dealer, the workmen and the owner of the building all suffered more or less. Incompetency and false pretense in all trades and professions should be steadily discouraged; and the only way to put an effectual check upon them is to give the preference invariably to the trained workman, who has earned and can rightfully wear the title he claims.—*Mechanical News.*

Mr. Stanley says the length of the Congo is 2,100 miles, and the Mississippi and the Nile together would scarcely equal its tribute of water to the ocean. From the mouth of the river a steamer drawing 15 feet can steam up 110 miles, at which point a land journey of 52 miles has to be taken, on account of rapids. Then another steaming or rowing voyage of 88 miles occurs, which is succeeded by a land journey of 95 miles. After that it is possible to steam up another 1,060 miles.

Natural gas is being found in many sections of the United States, Los Angeles, California, being in the list, with fair prospects of a good thing on hand.

Disposing of Dead Bodies.

THE latest method proposed for disposing of the dead strikes one a little curiously at first, but, after a little consideration it seems not to be a very bad idea. It is a proposal by a Mr. Pratt, an Englishman, to the effect that the bodies of the dead, instead of being buried in earth or cremated, should be encased in caskets and placed in a concrete slab, seven feet long by three feet six inches wide, having a place in the center large enough to receive the coffin. Soft concrete should then be mixed and filled in around the casket, and a concrete slab six inches thick be placed on top. The sarcophagi should then be banded heavily with iron, and, as fast as they accumulate, they should be built into a sea-wall to protect the coast of England from the ever recurring devastations of the sea. The blocks would all be of the same size, regardless of the size of the casket. In the case of infant burial, two or more could be confined in one block of concrete. This is really the first scheme which has been brought forth by which the bodies of the dead could be utilized to any good purpose. It is a good suggestion from an economist's point of view, as it provides coast defenses and a revenue at the same time. The idea is respectfully referred to the Committee of the House of Representatives on Rivers and Harbors. Thus, in the revised words of an ancient rhymster,

> A good man's bones when dead and turned to clay,
> May build a wall to keep the sea away.

—*Sanitary News.*

A BLACK ENAMEL FOR IRON.—*Le Genie Civil* of Paris says: For the last few years, many efforts have been made by different processes and various materials to protect iron and give it a brilliant black coating. Recently M. Puscher, of Nurenberg, has described a very simple process whereby he claims to cover iron with a black coating similar to enamel, and very much more evenly and regularly distributed, as it is not laid upon the metal with a brush or any similar tool. M. Puscher places in a vessel about eighteen inches high sufficient finely-powdered coal to cover the bottom to the depth of about three-quarters of an inch, and over this at a height of about one inch is placed a grating which carries the objects to be treated. The vessel is then covered and luted down tightly, and placed upon a brisk fire. The vessel is at once filled with steam, which soon evaporates, and is then charged with bituminous vapor. The firing is kept up for about half an hour, so that the bottom of the vessel is dull red; after which it is removed, and, when cool, opened. The residue of the coal is found in the form of coke, and the objects placed upon the grating, which have been at a fairly high temperature for a considerable time, are found to be covered with a black coating having all the appearances of enamel but of extreme tenacity and a considerable degree of elasticity. It is claimed that objects thus treated may be bent and exposed to great variations of temperature without in the least affecting the coating deposited on their surfaces.

Rosewood.

ROSEWOOD trees are found in South America and in the East Indies and neighboring islands. There are half a dozen kinds. The name is not taken from the color of the wood, as is generally supposed, but by reason of rose-like fragrance which it possesses when first cut. Some of the trees grow so large that planks four feet broad and ten feet in length can be cut from them. The broad planks are principally used to make tops for piano-fortes. The rosewood tree is remarkable for its beauty. Such is its value in manufactures as an ornamental wood, that some of the forests where it once grew abundantly have now scarcely a single specimen. New plantations have been set out, so that the supply will not be exhausted. —*Lumber Trade Journal.*

California redwood, particularly in the shape of dimension shingles, seems to be gaining ground in the Chicago and adjoining markets. They are largely used in suburban residences, not only on the roofs, but to take the place of siding. Their rich color makes them admirably adapted to this use without the addition of paint. Only recently the supply in Chicago was entirely exhausted, and users were obliged to wait for the arrival of consignments. There is also considerable demand for finishing lumber, and redwood is seen in a good many places where two or three years ago it would not have been thought of.—*Northwestern Lumberman.*

Experienced lumbermen have always held that timber cut in the spring was not durable for building purposes. Recent scientific investigations sustain this belief. It is shown that the richer the wood is in sulphuric acid and potassium the more likely it is to rot and mould. Wood cut in the spring contains eight times as much of the former and five times as much of the latter as wood cut in the winter.

Better times are predicted, generally, in all lines of trade and manufacture. Mills and manufactories that have been entirely idle, or working on half or three quarter's, are coming to run full hours. This is pleasurable to contemplate, and would be more so if there were assurances of permanency. But experience proves that when the ball begins to roll, there is such haste and anxiety to make it go faster that it gets beyond control and soon collapses; *i. e.*, eagerness to create demand beyond natural requirements, forcing sales and flooding and glutting the markets.

Notwithstanding the general complainings of "dull times" in California, matters have gone on fairly prosperously, and the future outlook is good, and hopeful expressions are freely repeated in business circles.

Sir Christopher Wren retired from public life at eighty-six; and after that he spent five years in literary, astronomical, and religious enjoyment.

Unfair Treatment of Contractors.

THERE seems to be some misapprehension on the part of the owners of projected buildings as to the limitation of their rights in the invitation and acceptance of competitive bids from contractors. It is but just that the lowest tender by a responsible bidder should be accepted, and personal friendship between owner and contractor, political or religious affiliation or business connection should be no cause for unfair discrimination.

In cases coming under our notice all of these causes have worked in determining the acceptance of tenders on the part of owners, contrary to the advice and against the will of their architects. In one case the owner attempted to excuse his acceptance of the higher bid upon the ground that "he had business relations with the bidder." In another he "had intended from the first that the accepted bidders should do the work, and only desired the other bids as a means of comparison of prices." In the first case the architect threw up the commission rather than be a party to such injustice; and in the second the owner was compelled to pay the lowest bidder for his time and trouble, under threat of the same loss of service.

Such action is, we take it, often caused by a lack of knowledge of the expense of time and labor required in making estimates, rather than by a willingness to take unfair advantage. We commend the honorable action of the two architects cited to their colleagues in the profession when like contingencies arise.

If any one thinks that the final denudation of our pine lands is an impossibility, let him take a trip over the Wisconsin Valley division of the Chicago, Milwaukee, & St. Paul railroad. When he has strained his eyes over a stretch of 80 miles of country, which, almost the entire distance, is a fire-swept waste of small, dead pines, with scattering live trees here and there, and an occasional "clump" of green, fair-sized timber, he will admit that here, at least, the available pine has been nearly exhausted; for almost every section of this vast area has been cut over, and all the pine large enough for lumber taken off. This is in Wisconsin, not Michigan, it must be remembered. A journey through the Black River region of the same State brings to view a like devastation of pine. As it has required only about thirty years of cutting to strip this territory, with a limited consumptive demand in the first years of the slaughter, we can well conclude that in less than thirty years from the present, very little available pine will be left in either Michigan or Wisconsin.

"Now, Johnnie," said the teacher, "if your father borrows $100 and promises to pay $10 a week, how much will he owe in seven weeks?" "One hundred dollars," said Johnnie. "I'm afraid you don't know your lesson very well," remarked the teacher. "I may not know my lesson very well," Johnnie frankly acknowledged, "but I know my father."

Street Architecture, New York.

WITHOUT objecting in the least to the conclusions of the writer in the *Record and Guide*, we are disposed to think that the decline in picturesque city architecture has been due much less to the unremunerative character of investments in oriels and turrets than to the change in the municipal regulations in regard to building, which now forbid any of those encroachments on the street lines, in the way of projections and bays, which once did so much to break up the monotony of the street façades. It is not easy for the best architect to give picturesqueness to a flat four-story front, twenty-five feet wide, and the praiseworthy efforts which are often made by the owners on a given street, to persuade all who build on the street to set their houses far enough back from the street line to allow of pleasant bays and oriels in the reserved space, are usually thwarted by the obstinacy of some "hog," to give him the title which his neighbors generally bestow upon him, who insists on thrusting the clumsy square mass of his own house into the space which it was decided to keep open. For this reason, more than any other, the New York architects have returned to something like the monotonous flatness of design of twenty years ago; but it is due to them to say that they have found means to deal with their severe restrictions in ways which are often surprisingly clever. Not to mention particular instances, the professional visitor to the upper portion of New York is now constantly struck by successful devices for securing shadow in the middle of flat fronts, as well as by most interesting examples of façades in which no relief is attempted, which give him, we think, quite as much pleasure as the mingled compositions and caricatures of Fifty-seventh Street; and although we are willing to go even farther than the *Record and Guide* in assuring owners and architects who are disposed to adorn the unrestricted districts with beautiful detached houses, like those of Hamstead and Chelsea, or like the little detached "hôtels" which cover the new and fashionable part of Paris, that the taste for such habitations is already prevalent enough in New York to ensure success to those who cater to it wisely, we trust that the beginning of the work of improvement, if not also the end of it, may be intrusted to architects who can temper the exuberance of their fancy with a little discretion.—*American Architect and Building News.*

Moscow has an enormous new cathedral, built in the Græco-Byzantine style, which covers 73,000 square feet, and has cost $12,000,000. It has five cupolas, on which 900 pounds of gold were used as embellishment, and thirteen bells, the largest as big again as the "Great Paul" in London. The largest door weighs thirteen tons, and cost $310,000. The marble in the building cost $1,500,000.

PAYING or forwarding $2.00, will be entitled to the present and all succeeding numbers for 1885, and the whole of 1886.

A New Phase in the Chinese Question—A Bold Strike against White Labor.

THE Mongolian cigar-makers then in the employ of Koenigsberger, Falk & Mayer, made a bold move on the 23d of October, and called a new deal, demanding the discharge of *every white man* engaged *with them in the making of cigars.*

This is the first high-handed break that the Celestials have attempted, aimed directly against white labor; and although it was a bad move for them, and a fortunate one for the white men, it is, nevertheless, a large straw that shows which way the wind blows; *i. e.*, what the Chinese would do if they could, and what they will do when and as often as opportunity permits—in isolated cases; and what they will do *en masse* should they ever be able to gain the points they, as a people, are playing for. It was bad enough that men of our own race and tongue should be humiliated to work side by side, or within the same walls, with creatures who, possessing the power, would trample in the dust and persecute with relentless severity and hate, and drive to penury and want, through unequal competition; but when they, upon American soil, raise the hand of open rebellion, assume an aggressive attitude, and demand the humiliation of those upon whose labor rights they are infringing, it is not to be wondered at that the working people as a whole are alive to the occasion, and greatly agitated; for in this first move there is a warning that should be heeded. It is *only one* instance, but it is as the ripple that precedes the storm, should they as a people strengthen and advance their present foothold, and become sufficiently numerous in the United States, with unrestricted liberty under our laws, to monopolize—as they will—all avenues of labor, and crowd every interest of the working and middle classes to an extent that will pauperize millions who otherwise might raise themselves, by their labor, to positions and conditions of comfort and moderate affluence.

All the thin-skinned sentimentalism that is prated in behalf of the "poor persecuted Chinamen," is all bosh—a waste of sympathy,—even if it is indorsed by Rev. Henry Ward Beecher, and others like him, who have themselves committed some very considerable errors of judgment, *if* not in acts in other directions. It may be well enough in a Christianizing sense, where a few can be held under "evangelizing" and "regenerating" influences, but it won't do as an immigrating, labor, and business proposition.

The proofs of the "nature of the beast" are too well established all along the Pacific Coast to need confirmation by further recitals, and this testimony is distributing itself in many other cities and States, to such an extent and of such character that the comparatively few Chinamen now on this continent are attracting very large attention, and eyes that have been blind, refusing to see what the people of this western coast have seen for years, are beginning to open and discover that there is a very important question to settle in this matter of Chinese hording and swarming upon American soil.

There is a great deal said about coolieism; but it matters not whether they come as coolies or free men, their presence is equally objectionable; perhaps more so as free agents, as then absolute personal interests would likely stimulate, rather than modify their ambitions, and augment rather than lessen their natural animosities toward the white race; adding zest and determination to their purposes of monopolizing, centralizing and controlling, until Chinese work-shops and manufactories worked by Chinese coolies or free men, as the case may be, will be located in every State, city, town, and manufacturing district upon the continent.

These assertions are not mere speculative presumptions, but are rational, reasonable, natural, common-sense probabilities,—conclusions clearly deducable from the practical experiences and contacts so far had with the people in question, who, as found in California, are a cunning, unscrupulous, treacherous and unprincipled race, in whom the shadow of truthfulness does not exist, when either falsehood or perjury can be utilized to advantage.

The firm named have wisely concluded to drop out all Mongolian help in the future, and employ white labor only. This is all very well as far as it goes, and is as it should be; but doing so will not deprive the heathen strikers of the knowledge they have gained, nor the mechanical art acquired in the manufacture of cigars, and, as it was of old, the race being mixed in with our own people are likely not only to be a "thorn in the side" of the working classes for all time, but manufacturers also will hereafter have increased cause to regret that they have educated a race against whom they cannot compete, upon any terms at present recognized as fair and equal.

Mortar for sewer work in all cases should be capable of setting in water. Portland cement and lias limes make good hydraulic mortar. The proportions of cement, or of lime to sand, should not exceed two and a half of clean, sharp sand to one, by measure, of ground Portland cement or lias lime. If clean furnace ashes or slag are available, there may be two of sand and one-half of ashes or slag, the whole to be mixed in a revolving pan, each panful to have twenty minutes' grinding. When mortar is used with bricks, the bed and joints should be spread thick and full over the entire area of both bed and joint, leaving, when pressed into place, a bed and joint never less than one-eighth of an inch in thickness of mortar. In four cubic yards of completed brickwork there should be not less than one cubic yard of mortar incorporated. In making mortar or concrete, it will be of the utmost importance to use clean materials and to preserve them clean. The water used for wetting bricks and for mixing concrete and mortar must be free from silt. Concrete and mortar should also be used on clean surfaces —*Sir R. Rawlinson, C. E.*

Healthful—Height of Stories.

THE *Sanitary News* quotes from the proceedings of the Sanitary Institute of Great Britain some sensible remarks by Mr. John Honeyman upon the advantages of low ceilings for the rooms of the smaller class of houses. In Mr. Honeyman's opinion, the popular notion that high ceilings are conducive to the healthfulness of rooms is erroneous. It is true that a room with a high ceiling contains a lar er cube of air, and, supposing the atmosphere of such a room to be perfectly pure to begin with, a man could exist longer in it before dying of suffocation than he could in a low room. Here, however, the sanitary advantages of the high room end; and ventilation, properly so called, that is, the constant change of the atmosphere, goes on, as most architects know, more satisfactorily in a room with a low ceiling than a high one. If the windows and doors extend nearly to the ceiling, as will usually be the case if the room is not more than eight feet high, the leakage of air which goes on to a very great extent around them, keeps all parts of the atmosphere of the room in motion, instead of moving the lower portion only, leaving an inverted lake of foul and hot air undisturbed under the ceiling, as is always the case where high rooms, inhabited in winter, depend for the movement of the air in them upon openings placed at some distance below the ceiling. To have the currents of fresh air circulate only in the lower part of the room, leaving the upper portion of the air in it unaffected, is practically a much worse way of ventilating the room than, with the same movement of the air, to cut off the upper stagnant portion of it by a low ceiling; for the stagnant atmospheric lake under the high ceiling, although motionless, keeps actively at work, under the law of the diffusion of gases, fouling the fresh currents which circulate beneath it; while, with low rooms and high windows, no accumulation of stagnant air can exist, the hot and foul atmospheric strata being swept constantly from the ceiling by the currents, just as dust is swept from the floor by a broom. Indirectly, moreover, the low ceiling improves the healthfulness of the room by its economy of heat. In a lofty room the poor man's stove expends a large amount of its energy in warming the ceiling, and the floor of the tenement overhead, without doing its owner any good whatever. It is only necessary to sit on top of a step-ladder for a while in a high room artificially warmed, to be convinced, without reference to a thermometer, that the temperature next the ceiling is, in all ordinary cases, far higher than that of the remaining air in the room. If the ceiling is not more than eight feet high or so, with windows to the top, diffusion co-operates with the atmospheric currents to bring the warm air at the ceiling down where it can be felt by the people in the room, while the cool drafts which blow in above the windows and doors, striking first upon the ceiling close by, carry off from it by convection a very considerable amount of heat, for the further comfort of the poor tenant's family. Saving thus a large part of the heat rom the stove, which would otherwise be wasted, the proprietor of the room is less disposed to convert his room into an air-tight box, by stopping up all the crevices around the windows and doors with weather-strips or rags, and even if he begins, from force of habit, to do so, the currents from the upper part of the windows and doors are, if they strike on or near the ceiling, so quickly modified in temperature as not to be felt as cold drafts; and this source of fresh air is left unmolested. In practice, we believe that most persons accustomed to observe the condition of air in inhabited places will agree that where similar means are provided for supplying and withdrawing air, such as a register and a fire-place, low rooms are, as a rule, decidedly fresher than high ones. In many cases a lofty room, supplied with pure warm air from a register, and ventilated by an open fire, will be found very oppressive, apparently from the influence of the large volume of stagnant air in the upper portion; while low, old-fashioned rooms with fire-places are almost always fresh and pleasant.—*American Architect and Building News.*

It is surprising to note how frequently one meets engineers, especially those in practical charge of engines, who have an idea that the function of the steam jacket is to prevent radiation of heat from the cylinder to the atmosphere, and regard its purpose in the same light as they do that of felting and lagging. In our last issue we briefly pointed out its true mission, and need not repeat it here. But this not uncommon fallacy of considering it as a non-conducting device instead of as a supply of heat for the entering and expanding steam, is worthy of special mention. We know of a naval engineer in Government service, who, much to the discomfort of his assistants, insisted on having the highest attainable temperature in the engine room, closing up all doors and windows, his directions being reinforced by the explanation: "What's the use of a steam jacket to prevent the radiation of heat from the cylinder, if the temperature of the room is not in the eighties or nineties?". And this view is cropping out constantly, in many other ways, as when exhaust steam, or steam of a pressure much reduced below that corresponding to the initial pressure of steam, is let into the jackets. If a steam jacket is to be of any practical use, the temperature of the steam it contains must at least equal that of the steam entering the cylinder. A queer and expensive kind of non-conducting device, indeed, in which the radiating surface is increased beyond that of the cylinder itself, and in which steam specially drawn from the boiler is the means.—*American Engineer.*

We Will Donate in Cash $150

The revival of business is not confined to this country alone, as recent reports from Europe, and more especially from the British Islands, indicate renewed and hopeful activity in manufactures and commerce, though the newly aroused spirit of enterprise can hardly be characterized as a boom. In these days of rapid communications, the people of all civilized countries are affected by much the same causes; but it is hardly possible for general life or general torpidity to prevail in one country while the opposite conditions continue in others.—*Western Architect and Builder.*

The postal laws seem to have been framed in some particulars expressly to oppress monthly publications for the benefit of weeklies. Take the case of the *Architect and Builder*, for instance. It costs two cents per copy to deliver it in this city, while the same paper is delivered at the residences and offices of California and New York subscribers for one cent per pound. All weeklies are delivered in the city of publication or anywhere else in the United States at one cent a pound. The absurdity of such an arrangement as this must be apparent to any one capable of a moment's reflection. In the case of monthly magazines the injustice is even more marked, as in the instance of *Harper's Magazine* as compared with the *Iron Age*. The weight of each is about the same, yet the latter is delivered to New York City subscribers for one cent a pound, because it is a weekly, while it costs two cents a copy, or about five cents a pound, to deliver *Harper's*. There is a general disposition upon the part of the monthlies to bring this matter to the attention of Congress and demand a more equitable distribution of postal burdens.—*Western Architect and Builder.*

"I'll tell you a good thing," said the Iowa dealer from Fort Dodge who came in "just to have a chat." "It illustrates how green a drummer sometimes is. A man from Wisconsin, say Oconto, for instance, sold a yard man in our town a load of cedar posts. There were 633 posts all told; the price was 10 cents apiece, and the amount $63,30. The freight bill was $69 42, which our lumber dealer paid. He then asked the Wisconsin post dealers to remit him the difference, $6.12, and they would be square. The Wisconsin men went to talking about the pay for their posts, but our townsman said he owed them nothing, but that on the other hand they owed him. He had bought the p sts delivered. An attorney was consulted by the Wisconsin gentlemen, but he told them they had no case. The drummer, I suppose, knew a cedar post when he saw it, but it probably did not occur to him that the railroads make any charge for hauling."—*Northwestern Lumberman.*

"Michael Angelo preserved his creative genius even to extreme old age; there is a device said to have been invented by him, of an old man represented in a *go-cart*, with an hour-glass upon it; and the inscription *Ancora imparo!*—Yet I am learning."

AN EXTRAORDINARY OFFER.

To All Wanting Employment.

WE want Live, Energetic, and Capable Agents in every county in the United States and Canada, to sell a patent article of great merit, ON ITS MERITS. An article having a large sale, paying over 100 per cent profit, having no competition, and on which the agent is protected in the exclusive sale by a deed given for each and every county he may secure from us. With all these advantages to our agents, and the fact that it is an article that can be sold to every house owner, it might not be necessary to make an "EXTRAORDINARY OFFER" to secure good agents at once, but we have concluded to make it to show, not only our confidence in the merits of our invention, but in its salability by any agent that will handle it with energy. Our agents now at work are making from $150 to $600 a month clear, and this fact makes it safe for us to make our offer to all who are out of employment. Any agent that will give our business a thirty days' trial and fail to clear at least $100 in this time, ABOVE ALL EXPENSES, can return all goods unsold to us and we will refund the money paid for them. Any agent or general agent who would like ten or more counties and work them through sub-agents for ninety days, and fail to clear at least $750, ABOVE ALL EXPENSES, can return all unsold and get their money back. No other employer of agents ever dared to make such offers, nor would we if we did not know that we have agents now making more than double the amount we guaranteed; and but two sales a day would give a profit of over $125 a month, and that one of our agents took eighteen orders in one day. Our large descriptive circulars explain our offer fully, and these we wish to send to every one out of employment who will send us three one-cent stamps for postage. Send at once and secure the agency in time for the boom, and go to work on the terms named in our extraordinary offer. We would like to have the address of all the agents, sewing machine solicitors, and carpenters in the country, and ask any reader of this paper who reads this offer, to send us at once the name and address of all such they know. Address at once, or you will lose the best chance ever offered to those out of employment to make money.

RENNER MANUFACTURING CO.,
116 Smithfield St., Pittsburg, Pa.

S. F. Chapter of Architects.

OWING TO the inclement state of the weather, but few members were present at the regular meeting of the Chapter on the 6th inst. No business was transacted. The next meeting will occur Friday, December 4, when it is hoped a goodly number will be present.

Fresh vegetables are so common here, and can be had so cheaply, that they actually become "monotonous," and hardly cause remark. All the year round the Chinese vegetable peddlers manage to raise them, and four or five crops in the same year is nothing unusual. Our Eastern friends can come here any time in the winter and find fresh vegetables on the tables, which they are only accustomed to see in the hot summer months.—*Rural Californian.*

Don't Fail to Write.

SHOULD this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing him one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

MASONS' AND BUILDERS' EXCHANGE
OF SAN FRANCISCO
Room 11, 314 Montgomery St.

BELOW will be found a list of the members composing this Exchange. Boxes are provided for each member, so that architects, owners, or others desiring the services of any particular member, or those having boxes who are not members, and yet whose business is directly connected with that of the Exchange, can readily secure the attendance of the party sought, by leaving a note in the respective boxes.

Staining Wood.

ON staining wood a writer in an exchange gives the following directions:—

A good mahogany color may be had by dissolving maroon lake in water, adding a piece of potash about as large as a walnut to a quart of water, plenty of the color. This will give a good mahogany imitation on any wood and can be used to darken the mahogany if so desired. Oak or ash may be stained brown by using linseed oil and benzine half and half, and burnt umber or Vandyke brown incorporated with this. Maple can be stained green-gray by using copperas in wa er; oak will also be changed to a dark-green blue through the same agency, the effect on ash being various shades of olive green. Ammonia applied to oak produces the bronze olive tint now used so much by architects. Staining by the fumes of ammonia results in all shades from light olive to the rich, deep brown of extreme age. This method is considered the best for imparting to oak or mahogany the appearance of age, and for those wishing to avail themselves of an easy, clean, and certain means of gaining the result, fumigating offers no serious obstacle to its accomplishment, the articles necessary being easy of acquirement and at small expense.

Procure for your use a box sufficiently large to receive the article; any well-made packing-box will be suitable, providing the joints or seams are close. Next get some strong full-strength liquid ammonia, not the diluted article of the druggist, pour some in a shallow receptacle—such, for instance, as a deep plate—place this in the bottom of the box, so that the fumes will rise and surround the object to be stained; close the box securely, so that the fumes will be confined as much as possible. When the article is small, of course the box need not be large—the smaller the better, for then you will not require so much ammonia. You can see how the staining progresses by wetting a portion from time to time; otherwise the change of color would not be perceptible. All that now is necessary is to leave the ammonia to do the work, remembering that the longer the exposure the darker the hue will be.

ABOUT SCREWS.—In an article on the manufacture of screws in Rhode Island the Providence *Journal* says: "It is interesting to note that, while the manufacture of wood screws probably originated in Westphalia, Germany, and was subsequently carried on in Eastern France and England before its introduction into this country, American inventors have supplied the machinery that is now universally employed. The popular feeling that the gimlet-point screw is a modern invention is erroneous. The American Screw Company have in their possession sample cards of French screws, pointed, though not so perfectly made as at present, which were brought from France early in the present century; and from an old piano now at Northampton, made about the year 1760, screws have been taken showing the same feature. Patents have been issued on gimlet-pointed screws, but they covered only a peculiar form of point. The gimlet is said to have been invented by Dædalus, a Greek.

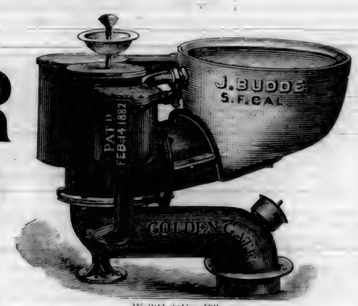
JOSEPH BUDDE'S

PATENT

WATER CLOSETS

WITH TRAP.

The Golden Gate Plug Closet.



WITH OFFSET.

This Closet is the best of its kind, having been so far constructed, it has the following advantages:—

1. It has a simple, strong valve, suitable for any pressure.

2. It has a real sanitary overflow, a copper float attached to a bell of the same metal resting on face of the brass overflow pipe, operated by the rising of the water in the closets above its level, thus absolutely preventing any escape of sewer gas, even the closets being without water.

3. It has no dead corner, consequently no foul water will be left in the closet after the lifting of the handle. A constant rush on of the flood chambers will keep the closet and trap perfectly clean.

This Closet takes the lead; it has been sold since February, 1885, in large quantities to the best satisfaction.

THE COMBINATION HOPPER.

This hopper is constructed to take 2 2-inch pipes, one to the right and one to the left, and a 4-inch leader in the center. It has also a movable strainer on top to take the surface water. The lower part of the hopper with side outlet is to be connected with the sewer pipe, either right or left. The upper part is independent from the lower, and is made to swivel, therefore it will suit either position of pipe. This hopper can be used only for surface, for waste, or for leader; either inlet will be stopped up with iron caps if so desired.

Side View, Combination Hopper.

PACIFIC PAN CLOSET.

This Closet is superior to all others, every working part and bolt being made of brass; closet and valve extra heavy casting. Particular attention is called to No. 4. This Closet has an oval basin fastened to the cover by brass clamps and bolts. No breaking of putty joints required to renew a pan. The loosening of two large brass nuts will separate cover with basin from the receiver. It has a heavy nickel plated cup and pull and solid brass rod.

These Closets have been in use since February, 1883. Plumbers and wholesale dealers give them the best recommendation.

Square Slop Hopper. Square Waste Hopper. Basket Hopper.

Basket Hoppers are made in one piece with Movable Strainer.

Annual Building Report for 1885.

In the accompanying review for the year's transactions in building operations, ending with the present issue, will be found a full, *corrected* summary for the twelve months last past.

Although it would have been more pleasing to be able to confirm and verify each separate monthly report as made, yet, finding some discrepancies in figures, we prefer correction, so as to make the yearly statement from December 15, 1884, to December 15, 1885, as nearly faultless as possible. Our purpose is to be correct in every representation made, and departures from this will in all cases be unintentional. Sometimes the information received is misleading; others, whose special affairs are sought to be represented, have to be relied upon for facts, and in some cases erroneous statements are made. But all possible care will be exercised to equalize this, and present reliable reports each month.

Report for month ending December 15, 1885, is as follows: 66 frames, value, $176,000; 14 alterations, value, $23,850. No. of buildings, 80; total value, $199,850.

The above report is the smallest in amount made during 1885, and $238,915 less than reported for the corresponding month of last year. But the totals for the entire year show a gain of $741,192, as follows, by the corrected figures for this year:—

First six months in 1885, ending June 15	$4,267,375
Second six months in 1885, ending December 15	2,776,624
Total for twelve months	$7,043,999
Total for the twelve months of 1884	6,202,807
Gain in 1885	$ 841,192

	FRAME BUILDINGS.		BRICK BUILDINGS.		ALTERATIONS ADDITIONS, ETC.		TOTAL BLD'GS	TOTALS MONTHLY.
January	62	$ 236,850	2	$314,000	9	$ 39,300	73	$ 590,150

NUMBER OF ENGAGEMENTS FOR 1885.

1,182	Frame buildings	$4,502,914
38	Brick "	1,872,600
237	Alterations	608,485
1,457		$7,043,999

NUMBER OF ENGAGEMENTS FOR 1884.

905	Frames	$4,112,201
25	Brick	1,536,645
197	Alterations	553,961
1,127		$6,202,807

IN 1883.

803	Engagements	$5,261,689

IN 1882.

785	Engagements	$3,896,212

IN 1881.

533	Engagements	$3,790,732

IN 1880.

397	Engagements	$1,754,435

By the foregoing it will be noticed that in the five months *prior to the June issue*, the reports as published *overstated* the actual engagements $202,684; the four months next following shows a discrepancy, *less than actual engagements*, of $146,010, and in October and November *excesses* to the amount of $10,100. But deducting the under from the over statement the error balances amounts to an average of less than $4.722 per month, in the correct gross sum of $7,043,999.

In the future we hope to, and shall use all due and reasonable care to avoid error of statement in building reports, and in all other connections.

Building Report for 1886.

It being the intention to issue this Journal, on and after January, 1886, on the fifth day of each month, instead of the fifteenth; and the building report in the present issue, including all information in this department, up to the tenth of the present month, the January number will contain the building intelligence of but two-thirds of a month, instead of a full month. Thereafter, the information will be special to each month, from first to last day, instead of from fifteenth to fifteenth.

The great error of overstating and exaggerating for effect sake, will be carefully guarded against. No good can come from perversion of facts in this or any other connection, nor is it honest journalism to represent things to be, which have no existence in fact.

Mr. M. J. Marion will contribute articles to this Journal regularly, commencing with the January number. Mr. M. is extensively known upon this coast, in New York, and many of the Eastern cities, as a geometrician of marked skill and ability, and our readers may anticipate much that will be instructive and useful, particularly in the difficult problems involved in the construction of roofs, domes, groined arches, stair work, and the innumerable intricacies classified under the head of geometrical demonstrations.

The Patrons of This Journal

MAY with confidence anticipate marked improvement in its size, general appearance, and contents, from and after its January, 1886, number. Each page will be enlarged

18 Square Inches, or a Total of 576 Inches.

FOR ITS 32 PAGES, EQUALING

FOUR SQUARE FEET,

Without increase in its subscription price.

EARNEST EFFORT WILL BE MADE

To avoid all mistakes, and make it in every respect acceptable to all architects, contractors, mechanics, and owners.

PATRONS WILL GREATLY OBLIGE

By notifying the proprietor personally, by letter or postal, of the slightest irregularity on the part of any one connected with its publication, either in its subscription or advertising department, or in its delivery.

PERFECT GOOD FAITH

Will be implicitly observed in every transaction. There is no *class journal published on the Pacific Coast* whose columns offer like advantages and inducements as an *advertising medium*, for all that pertains to

HOUSE CONSTRUCTION, DECORATION, AND FURNISHING.

Strength of Brick Walls.

THE question of strength of brick walls is often discussed, and differences of opinions expressed. The following is one of the rules given: For first-class buildings, with good workmanship, the general average should not exceed a greater number of feet in height than three times the thickness of wall in inches, and the length not to exceed double the height, without lateral supports of walls, buttresses, etc., as follows, for safety:—

Thickness.			Safe Height.	Length.
8½-inch	walls		25 feet	50 feet
13	"	"	40 "	80 "
17	"	"	55 "	110 "
22	"	"	66 "	130 "
26	"	"	78 "	150 "

Where the lengths must exceed these proportions, as in depots, warehouses, etc., the thickness should be increased, or lateral braces instituted as frequently as practical.

CANVASSERS FOR THIS JOURNAL WANTED

IN every city, town and county upon the Pacific Coast, and in every State in the Union.

Liberal Inducements to Responsible Parties.

Address, or call, Office of CALIFORNIA ARCHITECT AND BUILDING NEWS, 240 Montgomery Street, San Francisco.

Building Superintendence. By T. M. Clark; published by J. R. Osgood & Co., Boston. A valuable work of 336 pages. Every builder and architect should have one in his library. Price, $3.00.

San Francisco Chapter of Architects.

THE regular monthly meeting was held the 4th inst, President Curlett in the Chair, B. E. Henriksen, Secretary. After reading and approval of minutes, the Secretary presented the certificate of incorporation of the Chapter, duly signed by the Secretary of State, with the seal of the commonwealth affixed, and neatly framed.

Reports from the various committees were considered and acted upon. That having the matter of "fire ordinances" in hand was requested to proceed as rapidly as possible, as the subject is considered one of material importance, alike to architects and owners.

Mr. J. M. Curtis was elected Treasurer for the current year.

A circular from the Master Painters' Association was presented, and received with favor by all architects present.

A committee, consisting of Messrs. J. E Wolfe, John Wright, B. E. Henriksen, Wm. Curlett, and J. B. Whittemore, was appointed to consider the unspeakably grand bequests of the honorable Senator, Leland Stanford, and report thereon.

A paper was then read by a member upon the lien law of California, in which was specially noticed the clause requiring the *filing* of all contracts with the County Recorder prior to the commencement of contemplated works. Its illegality, insufficiency for the purposes contemplated by the manipulations of the act; its immoral, unjust, and pernicious effects, were dwelt upon. The expressions of all present were in harmony with the sentiments of the paper read.

Mr. H. C. Macy was appointed by the Chair to lead the discussion at the January meeting of the Chapter, upon the subject of sewerage and drainage.

At a late hour the session ended, all present being well pleased with proceedings, the only regret being that more members were not present to reap the benefits of the occasion.

Building Improvements in New York.

THE *Real Estate Record* says: "By the end of the year 1885, about 3,400 houses will be finished or under way in this city (New York), the cost of which will be nearly $46,000,000. In Brooklyn there are about 4,000 new structures, which will cost about $20,000,000. In addition to these, about 12,000 houses, valued at not far from eighty millions, have been started during the year in localities adjacent to New York and Brooklyn, whose population does business in these cities."

Grimshaw on Saws, with Supplement, by Robert Grimshaw. A book of 279 pages, neat and clear in typographical execution, and full of facts and figures in relation to saws. The number and variety of its illustrations add greatly to its interest. It contains a large amount of valuable information. Thos. W. Hartley & Son, publishers' agents.

A Manual of Industrial Drawings for Carpenters and Other Wood-workers, by W. F. Decker, instructor in drawings in the University of Minnesota. Published by W. F. Comstock, N. Y. Price, $2.00. *Sent by mail free of postage to any part of the world.* To be had at the office of this Journal at publishers' price. An excellent, practical book.

Not Guilty—Complaint Dismissed.

IN last issue of this Journal, the arrest of Messrs. Wright & Sanders, architects, for violation of the fire ordinance of San Francisco, was noticed, and the facts substantially stated. Since then the merits of the case have been tested before a jury, in Police Court No. 2, Messrs. Rix & Firth, contractors for furnishing the box girders in issue, being the defendants, which resulted in a verdict of not guilty, upon the following grounds:—

It was shown, first, that when the fire law, under which the arrests were made, was framed and made part of the city ordinances the only plates easily obtainable in San Francisco for the manufacture of box girders were in lengths of ten to twelve feet each. Consequently, they had of necessity to be built and made with butt joints and laps. To compensate for this, the law was made to compel a diaphragm at each five feet, the ordinance making no provision for any substitution, even of a better kind; and the girders causing the arrests, although made of plates full length without piecing or lapping, were subject to the same technical regulations in their construction, *i. e.*, diaphragms at each five feet. The ordinance also requires that "the riveting shall be *done hot*, and hammered [hence, hand riveted] to a proper conical head." The girders under arrest were hydraulic, riveted to cupped or button heads. And, it being shown that the riveting adopted was equally as good, if not in fact better than the conical heads, particularly as the only restriction in that respect is "proper conical heads," leaving the real strength value contingent upon the judgment of the maker, or the caprice of the fire department inspector, the jury considered the issue upon that point as insufficient to sustain the charge.

Secondly, it was shown that the girders in dispute were well made, with all the plate parts in full length without joints, and the diaphragms sufficient in size, spaces, and number for all practical purposes, and that the riveting, being done by hydraulic pressure, was better than hammered work by hand. The jury failed to realize more than an immaterial, technical violation of an ordinance which greatly needs change and amendment in this and numerous other particulars. A verdict of not guilty being rendered in the case named, the charge against Wright & Sanders, the architects, and the owner of the property, was dismissed.

When American establishments can furnish locomotives in Australia for $2,000 each less than the price at which work not so satisfactory can be obtained in England, and in a much shorter time, as was recently done, our manufacturers certainly ought to be encouraged to compete actively for business in that great continent.—*Railway News.*

Shoppell's Modern Houses, issued quarterly, at $1.00 per number, or $3.00 per annum; 72 pages, 11x14 inches, well filled with plans and designs for suburban and country houses.

The Building Outlook for 1886.

MUCH interest is expressed in the probable building operations for the coming year. The closing monthly report for 1885 shows a large decrease as compared with the preceding month, but this fact is no criterion for judging the future.

The number of buildings erected within the last twelve months is shown to be large, and by many the falling off has been expected and prognosticated for months back. The decline cannot, however, be denominated as a "bad break," but a natural letting up—an easement for reflection and preparation, to be followed by a speedy revival of extensive operations.

Of course, no one can tell, nor approximate with any degree of certainty, the extent of future activities; but this can be stated as foreshadowing the probabilities of the future,—a splendid feeling of confidence and hope prevails in all directions. The timely rains, beautiful weather, encouraging prospects for abundant harvests, fair trade and traffic generally, the few houses and buildings to rent in desirable localities,—all serve to encourage large expectations for the future. Several large brick buildings are prominently talked of, and from probabilities almost reduced to certainties, we are justified in stating that the number of bricks in prospect to be laid in 1886 will double those used during the current year. There are also a sufficient number of plans for frame structures, now ready or preparing in architects' offices, to give a handsome commencement during the early months of the coming year.

Materials of all kinds are *cheap*—seldom, if ever, more so—with no present prospect of an early increase in prices. Labor is abundant, and contractors anxious for work. Although the number and gross amount of failures during the past year have been greater than should have been, they are far less than in some former years. But conditions in this particular are improving. Material men are scarcely as *reckless* as they used to be in encouraging unknown, untried, and doubtful parties. The responsibilities of contractors, as a class, is improving; as owners are realizing that the employment of reliable men is by far the better method, even at slight advance, which in the long run is true economy, as such a course insures better work and buildings, and often saves immediate coin, as work let to the *refuse* class often involves costs and outlays far greater than the difference in amount of bids between good and ungood contractors.

Whatever may be in store for us, to be developed as time rolls by, this one thing is eminently true,—that the spirit of great buoyancy prevails generally, and expressions of confidence in what is to be, are almost universal.

The Los Angeles "Herald" says that a large bed of choice potter's clay has been discovered in the Temescal Mountains, about sixteen miles from the California Southern Railroad.

A Needed Remodeling Commission.

IN view of the incompleteness and insufficiency of the present fire ordinances as affecting the construction of buildings in San Francisco, a board consisting of competent architects and civil and mechanical engineers, should be appointed by the Board of Supervisors, to prune and remodel the present, and provide an intelligent building law in harmony with the necessities involved in the erection of buildings in this city. Such a board ought to be able to prepare a very perfect code of ordinances, as all the principal Eastern cities are well provided in this regard—some of them of very recent date, and copies of such laws can be had to guide deliberations, and lead to a consummation entirely satisfactory to architects, property owners, and the fire department. We do not wish to be understood as seeking to reflect adversely upon the fire wardens, or the officials of the fire department, each and all of whom are doubtless performing their trusts and duties conscientiously, under the laws and ordinances as they now stand. But it is difficult for even good and honest officials to fulfill their duties satisfactorily, when the laws by which they are governed are defective, inexplicit, and insufficient. And the fact that the present ordinances are so, frequently gives rise to issues which might be provided for and regulated in a more perfect and comprehensive fire law.

PROPITIOUS INDICATIONS.—The copious rains that have fallen in California and adjacent States and Territories, since the 14th of November, have spread a general feeling of confidence in all directions, and among all classes, as by their coming, all doubts and fears as to a bountiful harvest have been dispelled, and predictions—perhaps the child of hope—are to the effect that the year 1886 will be one of very great prosperity. With nothing occurring to change the present outlook, it is fair to calculate on lively times for the incoming year. As a matter of course, with abundant harvests of cereals, fruits, and vintages, the building interests will be stimulated, and a continuance of brisk times is sure to follow.

Florence, the actor, tells the following concerning Morse: "I can remember," he said, "years and years ago, going to a dinner down in Fourteenth Street, given to Morse, the telegraph inventor. He was an elegant old gentleman, but when he got on his legs to talk he was awful long-winded. I had a friend with me. We listened to Morse's speech, while he predicted great things for electricity. I remember that he predicted, too, that some day men would be able to talk over the wires for distances of fifty miles, and that every ship that left harbor for an ocean voyage would be connected with the land by wires. When he got that far, my friend said, 'What rot,' and we went out. I have often remembered how foolish his talk sounded to me. Yet it has been all realized, except as regards ships at sea. I believe even that will come about some day."—*Electric Review.*

California Redwood in London.

THE (London) *Timber Trades Journal*, in commenting upon the growing scarcity of fine quality wood for high-class joinery work, and referring to "redwood in the Chicago market," among other things quotes from a contemporary:—

Chicago, a town of little note twenty years ago, has now become one of the largest cities of the Northwest; situated in the center of teeming forests and fertile plains, on the banks of the vast lakes and their tributaries, it became the great store-house for timber, and farm produce as well. The forests in its immediate vicinity soon became exhausted, but abundance of pine, spruce, and hemlock, with other varieties, continued, and still continue to pour down the various rivers of which it forms the connecting point. Yellow pine, for many years, and still, an abundant commodity, was rising in price, as Chicago grew, and the higher or finer grades are now at a considerable premium on the values of other descriptions. To supply this apparent scarcity the Canadian forests became contributors to the Chicago market, and yet the calls were for more.

This is probably why the dealers are looking in the direction of the Californian forests for a supply of fine lumber to meet the growing wants, and by an abundant stock check the upward tendency of high class wood that is now so glaringly in contrast to the commoner grades.

Will the Californian wood do this? At present, from the remarks of our contemporary, sufficient redwood is not brought on the market to make it take a recognized place, and till the supply is of a regular character, with enough yarded to be relied on, no encouragement is given to the demand. Supposing the requisite stock is available in Chicago, or elsewhere, when the high values of the upper grades are so marked, we fail to see how the sequoia can supply the place of pine. The woods are essentially different. They hardly have a single attribute in common between them, beyond the absence of knots and sap. First quality pine, such as we see shipped at Montreal and Quebec, is a peculiarly, silky, soft wood, with a capability of being worked up to an even surface as smooth as glass, by the mere action of sand-papering.

Sequoia will not always show this smoothness; in fact, it is rather noticeable for its grain and dark color, another feature that removes it out of the path of pine. Pine is used for patternwork, and its whiteness is an advantage in making pencil marks, but the Californian wood is as dark as cedar, and the figure on it would be a decided objection to patternmakers. Another thing, it is much heavier than first pine, sequoia being relatively 108.9; pine, 100. There are uses to which second quality and the other grades of pine are applied, the place of which sequoia could well supply, but its present price puts it quite out of the reach of consumers.

The London *Journal* adds:—

"We differ with our American contemporary, who only thinks that the Californian redwood will come into competition with the higher grades; probably the high price led him to take this view. As stated, we think it will never make headway, at any rate in this market, until it can be put in at a price that will come within the range of ordinary building woods."

"If sequoia intrinsically is as meritorious as the best grades of the deals supplied from Montreal and Quebec, with which it is to directly compete, when offered under the hammer it should go as freely. Of course it has the disadvantage of being strange to many in the trade."

OLD NEW YORK FIRE-PLACES.—On "Monday, October ye second," just 181 years ago, a Boston lady undertook a journey to New York City, an account of which was published in 1825, from a diary in the author's own handwriting, "being a faithful record of Madam Knight's adventures over 'that tract of country where she traveled about a fortnight, on horseback, under the direction of a hired guide.'" Madam seems to have been much pleased with New York, where she made many acquaintances amongst the good women of the city, "who courteously invited me to their houses, and generously entertained me." And her description of the city at that time is well worth reading. She says: "The Cittie of New York is a pleasant, well compacted place, situated on a Commodious River, which is a fine harbor for shipping. The Buildings. Brick Generaly, very stately and high, though not altogether like ours in Boston. The Bricks in some of the houses are of divers Coullers and laid in Checkers, being glazed look very agreeable. The inside of them are neat to admiration, the wooden-work, for only the walls are plastered, and the Sumers and Gist are planed and kept very white scowr'd as so is all the partitions if made of Bords. The fireplaces have no Jambs (as ours have) But the Backs run flush with the walls and the Hearth is of Tyles and is as farr out into the Room at the Ends as before the fire, which is Generally Five foot in the Low'r rooms, and the piece over where the mantle tree should be is made as ours with Joyner's work, and as I supose is fastened to iron roods inside. The House where the Vendue was, had Chimney Corners like ours and they and the hearths were laid with the finest tile that I ever see, and the stair-cases laid all with white tile which is very clean, and so are the walls of the Kitchen which had a brick floor. They were making Great preparations to Receive their Govenor, Lord Carnbury from the Jerseys, and for that End raised the Militia to Gard him on shore to the fort."—*Weekly Statement.*

A Manual of Industrial Drawings for Carpenters. An excellent work, full of instruction. 176 pages, 6x9 inches, neatly bound. Price, $2.00.

Not Published in Personal Interest.

EVERY fair-minded reader must have noticed the fact, and admit, that the conduct of this Journal has been absolutely free from any and all special reference that could be construed as being of *personal interest, i. e.*, using its columns for the advancement of the professional interests of its proprietor. There has never appeared a single article or allusion which has given special prominence to our architectural department, more than has been freely accorded to each and all brother architects, and the same courtesies would have been cheerfully extended to every member of the profession presenting like opportunities, not excepting those of spiteful turn of mind, who seem to be best pleased, and more in their natural element, when extolling and praising their own abilities, and aspersing, denouncing, and misjudging others. Sorry that this is so, but this Journal will not be affected by it, but will continue to live, prosper, and become more permanent with each year of its existence, nor change its course, whether it receives the frowns or smiles of those who from misjudgment, or motives of envy, jealousy, or otherwise, antagonize their feelings and withhold patronage.

We do not covet a single unkind thought from any one, and shall not intentionally provoke any, yet we do not expect to be able to skim along so closely to the line of perfection as to hope to be able to shape a course to the satisfaction of all. The best that any man can do will not be good in the eyes of every one. Humanity in some is exacting and merciless toward others, although none are exempt from human frailties, weaknesses, and faults. Still we shall do the best we can, hoping to receive all the encouragements our earnest efforts shall deserve, and as much more as our generous readers and the public may, in the magnanimity of their hearts and natures, see fit to bestow.

We have received from George Stinson & Co., of Portland, Maine, the well-known art publishers, a magnificent, full length, steel engraving of General Grant. It is after Anderson's celebrated photograph, which was made while the General was still in full vigor, and represents him in his sturdy, manly strength, as the people wish to remember him. It is, undoubtedly, the best portrait ever made of the General.

Messrs. Stinson & Co. are in need of agents for several important, popular, new publications, and offer inducements that should be heeded by those in need of profitable work. Those who write to them will receive, free, full particulars.

LEAD PIPE.—The Romans appear to have been acquainted with the use of leaden pipe, although they had not the appliances for falsificating any of large dimensions, or sufficiently strong to withstand pressure from the fountain head. In the museum at Cherchel is a piece of lead piping made by rolling a sheet of metal, turning the edges over, and then running molten lead along the joints.

Qualified and Competent Foremen.

EXPERIENCE proves that the right man in the right place, as foreman, to manage and direct operations in the erection of building, and in all kinds of mechanical works, is of the highest importance to all concerned—contractor, architect, and owner as well. To the contractor in two important respects: first, financially, as the profit or loss results are very materially affected by the right and proper management of the workmen, so as to obtain from them the full, reasonable, and right amount of service within the hours of labor. This can be done by a competent head man, without the workmen experiencing a sense of having been "driven"—urged beyond a fair application of his working abilities. The influence exerted upon a gang of men by a respectful, yet persevering and exacting leader, is great. Men worthy the name of mechanics will follow cheerfully when led by one capable of rightly filling the position of foreman, with a right understanding of human nature as found and developed among "gangs of men," and knowing *how* to sympathize or rebuke as may become necessary. While the good foreman needs to be firm, determined, and ever on the alert, the exercise of good judgment is of the highest importance, and a certain degree of patience is indispensable, for the purpose of pacifying and controlling, where petulancy and harshness might vex and excite the inferior passions, and promote idleness and disinterestedness, to the financial disadvantage of the contractor. Secondly, if the foreman is not in every way qualified for the position, so as to be respected and promptly obeyed by the workmen, they become careless as to the quantity of work done, with more interest in pay-day, and the expected sum of wages at the end of the week, than anything else, while under the better condition of things individual interest is felt in the progress of the work each day, with pay-day as a known certainty when the week shall end.

To architects the good foreman is the all-important man—much more so in his place than the contractor himself, as the proper understanding and correct carrying out of the plans and specifications, as a rule, are intrusted to him. Mistakes are made or avoided according to the capabilities of the foreman, who is expected to lay out and dictate all measurements, and order and direct every department of the work. With a competent man, an architect's duties become infinitely more easy and pleasant, as the professional cares and anxieties are greatly modified when the management is in right hands, both as to quality of workmanship in general construction, and neatness and completeness in the finish. And to the owner, although perhaps ignorant of the numerous possibilities attending the erection of a building, the good foreman is all important, as the results for which he pays are materially affected by the qualifications of the man who directs the mechanical operations. It is possible for a foreman to do many mean things, and incorporate defects, and hide them even from the closest scrutiny of the architect, to the injury of the owner's interests.

Eastern Competition in Wrought Iron Work.

THE facts brought out in connection with the "box girders" made East and shipped to San Francisco for use in the Union Club Building, and elsewhere noticed in this issue, are strongly suggestive, alike to "wrought iron workers," owners of property, tradesmen, general dealers, and business men. To wrought iron workers as suggesting the necessity for more complete and perfect arrangements, machinery, and appliances, enabling the handling, shaping, and *dressing* of heavy girders and all other description of works, to advantage, and doing all that can be done in any other part of the Unit d States, as cheaply and as well, barring differences in cost of labor, and even overcoming that to a large extent, if not entirely.

. . . . . .

A material difficulty in this connection exists in the fact that the *number* of shops and firms operating in this line are far too numerous for this city, except in *extremely* brisk times; that while there are two or three fairly equipped establishments, sufficient in appointments to supply all ordinary demands, or, in fact, anything that might be required of them in wrought iron work, there is no one firm or establishment of comparative "*gigantic proportions*" capable of taking hold of any work offered and defying all outside competition.

. . . . . .

The freightage and handling expenses of plate iron in long lengths certainly should not be any greater, if so great, as that of heavy, manufactured girders. In this regard, the advantages should be on the side of our local workers, with which, as a fact, leaves all the advantages possessed abroad, in the more *complete methods* of working, and any difference that may be in labor and incidentals.

. . . . . .

As far as owners are concerned, they have a *partial* right to do as they please in such case, that right being limited only to the extent of the personal obligation resting upon every man who has accumulated property in a community, to assist in strengthening and sustaining the surroundings, which give increased value to property; and every intelligent man must understand and admit that the retention and circulation of money within a community adds value to its real estate, as well as increased personal wealth,—considerations which largely or altogether regulate *rental incomes;* consequently it must be adjudged that they are more selfish than wise who spend their money in distant places that cannot, in the nature of things, be expected to return any direct or indirect advantage to the payor, beyond the primary savings in first cost.

. . . . . .

Tradesmen, general dealers, and business men are alike interested in the effects and results of every contract let to parties doing business outside the State of California, in that it removes money from local circulation, to other parts of the country, whence no return can be had or expected. The tradesman in our midst cannot spend that which he should have, but has not because sent to other parts, and the dealer and business man is short in his receipts just whatever of coin might and would have resulted to local trade in purchases that might have been indulged in, had the contract moneys been retained within local bounds and circulated among the working men and others in San Francisco.

. . . . . .
